PEARS
CYCLOPAEDIA

A book of reference and background information for everyday use

Sixty-ninth Edition

1960–61

Editor, L. Mary Barker, B.Sc.Lond.

ASSISTED BY TEN SPECIALIST ASSOCIATE EDITORS

The Editor desires to express her gratitude to readers for their criticisms and suggestions and to all those who in one way or another have contributed to the making of this edition. Correspondence is welcomed and should be addressed to the Editor at 'Middlemarch', Halstead, Kent.

First published 1897

Printed and Bound in Great Britain by Richard Clay and Company, Ltd., Bungay, Suffolk

New Features of this Edition

THERE are two new sections in this Edition of special interest to the family circle—on Careers and Gardening. The former is by a well-known Headmaster with long experience in helping young people to choose an occupation. The new Guide to Gardening, by a leading authority, embodies the latest ideas and methods in horticulture.

Eminent specialists tell of some of the exciting new advances in scientific discovery and its application: space exploration, future sources of power, chemistry in the living cell, electronic brains, and colour vision. This is in the Science Section (Part IV), where the naturalist will find an interesting new hypothesis on the migration of eels.

In the Science Section, also, a number of engrossing problems about the individual in our industrial society are unravelled in the light of psychology and sociology. This imparts a new understanding of the rebel, about whom there has been so much public discussion—whether he be an " angry young man," a " beat," or a " delinquent."

For the newspaper reader interested in public events and world affairs the Citizen's Guide has been revised, and there is a new supplement, to Medical Matters, on world mental health.

Those interested in books and in writing will find fresh pages in Literary Companion on Literary Forms and How to Enjoy a Poem.

The aim of *Pears* is to keep abreast of expanding knowledge in a changing world, and it presents its readers each year with a revised edition with the latest facts and background information on a variety of subjects of general interest.

Plan of Volume

This book of reference is divided into sections which fall into three main groups:—

Contents

I. THE WIDER WORLD

II. EVERYDAY INFORMATION

III. HOME AND PERSONAL

Index

Some of the sections are alphabetically arranged, and consequently self-indexing. Their contents are not indexed here, except where it is anticipated some special difficulty in reference may arise. Each section has a letter and, where appropriate, the column is given in parentheses after the page number, e.g., F8(1), G20(2). Where the contents of a section are not alphabetically arranged, a Table of Contents will be found at the beginning of the section.

Events

Setting forth in chronological order the leading events in the history of the world

Chronicle of Events

Note.—*Dates given below earlier than the first millenium* B.C., *and even later, must necessarily be approximate in the absence of contemporary records.*

August 8 International conference on peaceful uses of atomic energy opened in Geneva (1200 scientists from 72 countries attended).

September 16 Universal Copyright convention came into force, bringing U.S. into agreement with European countries; **19** General Perón resigned after rebels threatened to bombard Buenos Aires; **22** Independent television service began.

October 2 City of London became a "smokeless zone"; **12** British and Soviet warships exchanged courtesy visits; **20** Syria and Egypt signed mutual defence treaty; **23** Referendum on Saar European Statute gave victory to pro-German parties.

November 5 Vienna State Opera House re-opened; **23** *Hamlet* played on Russian stage by British company, the first since Tsarist times.

December 7 Mr. Attlee announced his retirement and was created an earl; **12** Completion of 830-mile pipeline through Urals, crossing 6 rivers; **14** Mr. Hugh Gaitskell elected leader of the Parl. Labour Party; **18** Anglo–American offer of financial assistance to Egypt in building Aswan High Dam; **24** In Christmas broadcast

A.D.

the Pope spoke of need to suspend nuclear test explosions.

1956

January 1 Sudan proclaimed an independent republic; **27** The Queen and the Duke of Edinburgh left by air for 3 weeks' tour of Nigeria; 200th anniversary of birth of Mozart celebrated; Terrorist activity in Cyprus increasing.

February 1 Britain had coldest day since 1895; **13** Referendum in Malta resulted in vote in favour of integration with Britain; **16** House of Commons rejected by majority of 31 Government motion to retain death penalty; Bank rate increased from 4½ to 5½ per cent. (highest since 1932); **23** Remarkable sunflare caused increased cosmic radiation and long-wave radio disturbances; **25** M. Khrushchev in speech to Congress of Russian Communist Party denounced Stalin.

March 2 King Hussein of Jordan discharged Lieut.-Gen. J. B. Glubb; **5** Telephone weather forecast began; **9** Archbishop Makarios with leaders of Enosis movement in Cyprus deported to the Seychelles; **23** The Queen laid foundation stone of new Coventry Cathedral; Pakistan proclaimed an Islamic Republic within the Commonwealth.

April 6 Earl Attlee created Knight of the Garter; **11** Five-day week for Civil Servants announced; **18** Cease-fire between Israel and Egypt came into force; **29** French occupation of Indo-China ended after 80 years.

May 23 First atomic power station in Britain started working at Calder Hall; **24** 2,500th anniversary of the death of Buddha celebrated in India; **31** May was the sunniest month at Kew since 1922 and the driest since 1896.

June 3 Third-class travel abolished on British Railways to conform to continental practice; **13** Last British troops left Suez; **24** Col. Nasser elected Pres. of Egypt.

July 20 Britain joined U.S.A. in withdrawing offer to help Egypt finance Aswan High Dam; **26** Pres. Nasser announced nationalisation of Suez Canal Company.

August 30 French troops arrived in Cyprus.

September 25 Newly-laid submarine telephone cable linking Britain and America opened to public service.

October 3 Bolshoi Ballet danced at Covent Garden; **15** Duke of Edinburgh left on world tour; **16** Prime Minister left with For. Sec. for Paris meeting; **17** The Queen opened Calder Hall, the world's first nuclear power station for commercial use; **19–21** New liberalised policy adopted by Central Committee of Polish United Workers' Party; M. Gomulka elected first secretary; **23** Insurrection broke out in Budapest and spread throughout country; **28** Pres. Eisenhower called upon Israel not to "endanger the peace"; **29** Israeli forces invaded Egypt and after 5 days' fighting had control of Sinai peninsula, heavy fighting at Abu Aweigila; **30** Britain and France issued 12-hour ultimatum to Israel and Egypt to cease fighting; Britain and France vetoed US resolution in Security Council calling upon Israel to withdraw behind armistice line; **31** Anglo-French offensive launched against military targets in Egypt.

November 2 UN Gen. Assembly called for immediate cease fire in Egypt; **4** Canadian resolution calling for international UN force for Middle East adopted; Soviet forces launched attack on Budapest to crush uprising; **5** Anglo-French airborne troops landed at Port Said; **6** Seaborne troops landed at Port Said; Pres. Eisenhower re-elected President with Congress controlled by Democrats; Anglo-French forces ceased fire at midnight; **7** Egypt accepted cease fire on UN conditions; **15** UN Emergency Force left Naples for Suez; **16** Suez Canal blocked by 49 ships; **17** First refugees from Hungary arrived in Britain; **22** Duke of Edinburgh opened 16th Olympic Games in Melbourne; **23** Sir Anthony Eden flew to Jamaica for rest cure; **24** UN for third time called upon Britain, France, and Israel to withdraw troops from Egypt.

December 5 140 people arrested in S. Africa for alleged treason; Anglo-French forces began to leave Port Said; **19** Lord Radcliffe's proposals for a constitution for Cyprus published; **29** Suez Canal clearing operation by UN salvage fleet began.

1957

January 1 Anglo-Egyptian treaty of 1954 abrogated by Pres. Nasser as from October 31, 1956; Saar became tenth *Land* of German Federal Republic; Road Traffic Act came into force; **5** Eisenhower Doctrine for Middle East announced; **9** Resignation of Sir Anthony Eden as Prime Minister; **10** Mr. Harold Macmillan appointed Prime Minister; **16** Sadlers Wells Ballet group combined to form The Royal Ballet; Death of Signor Toscanini; **20** Mr. Gomulka's National Unity Front overwhelmingly returned in Polish general election; **26** Formal integration of Kashmir with India; **31** Trans-Iranian oil pipeline from Abadan to Teheran (600 m.) completed.

February 7 Bank Rate reduced from 5½ to 5 per cent; **15** Mr. Gromyko replaced Mr. Shepilov as Soviet Foreign Minister; **16** The Queen flew to Portugal on State visit and joined Duke of Edinburgh there who had just completed World tour; **22** Duke of Edinburgh granted title of Prince of the United Kingdom; **26** Indian resolution adopted by UN for "peaceful, democratic, and just solution" of Cyprus problem.

March 1 Mass protest in Tokio against nuclear weapon tests in Pacific; **5** Fianna Fail party under Mr. de Valera secured absolute majority in general election; **6** Ghana celebrated independence; Israeli withdrawal from Sinai completed; **11** Warning by WHO of genetic effects of radiation; **13** Anglo-Jordanian treaty of 1948 ended; **21** Homicide Act in force (death penalty retained only for five categories of "capital murder"); **25** European Common Market and Euratom treaties signed by France, Germany, Italy, and Benelux countries.

April 3 British Labour Party called for abolition of H-bomb tests; **4** No further call-ups for National Service after 1960; **8** The Queen and Prince Philip arrived in France on State visit; **9** Suez Canal cleared and opened to all shipping; **11** Agreement signed in London granting full internal self-government to Singapore from Jan. 1, 1958; **17** Archbishop Makarios arrived in Athens from exile; During the month appeals were made by the Pope, Dr. Schweitzer and Mr. Nehru for the banning of nuclear tests and weapons.

May 14 Petrol rationing (imposed 17.12.56) ended; **15** First British H-bomb exploded in Central Pacific near Christmas I.; **16** M. Spaak succeeded Lord Ismay as NATO Sec. Gen.; **18** The Queen and Prince Philip left for State visit to Denmark; **20** Death of Dr. Gilbert Murray.

June 1 New Copyright Act came into force; First drawing of Premium Bond prizes; **17** Historic decisions taken by US Supreme Court on matters relating to civil liberties; **19** Completion of British H-bomb tests in Pacific; **30** The IGY opened at midnight.

July 1 Women voted for the first time in Egypt's first general election since revolution of 1952; **17** Electricity Bill enacted appointing new Central Electricity Generating Board and Electricity Council in place of Central Electricity Authority; **18** President Mao Tse-tung's famous "Let 100 flowers blossom and 100 schools of thought contend" speech published; **25** Tunisia declared a republic; **31** Federation of Malaya Independence Act received Royal Assent.

August 1 Sir Christopher Hinton appointed chairman of new C.E.G.B., responsible for new nuclear power stations; **31** Royal Charter granted to Tangier by King of Morocco.

September 6 Disarmament discussions in London ended without agreement; **15** German general election (Dr. Adenauer re-elected Chancellor Oct. 22); **19** Bank Rate raised from 5 to 7 per cent.; **20** Death of Jean Sibelius, the Finnish composer; **30** Network Three introduced by B.B.C.

October 4 First earth satellite launched by Russia

A.D.

(180 lb. sphere, 23 in. diameter); **10** U.S.A. abolished fingerprinting for foreign visitors staying less than a year; **11** Largest radio telescope in world went into operation at Jodrell Bank for Manchester University; **14** The Queen opened Canadian Parliament in Ottawa; New road-rail double-decker bridge over Yangtse, one of largest in world, opened to traffic; **17** Endorsement of cheques no longer necessary save when negotiated.

November 3 Second earth satellite weighing half a ton launched into space by Russia with dog on board; **16** Russia announced construction of "scientific city" of 12 research institutes in Siberia; **20** Britain's first export order for nuclear power station for Northern Italy announced.

December 1 Latin 26-letter alphabet to be adopted in China; **4** Ninety people killed in railway accident in fog at Lewisham; **6** Attempt to launch earth satellite in the U.S.A. failed; *Sputnik I* completed its thousandth circuit of the Earth; **25** The Queen's Christmas broadcast televised for the first time; **31** The *Sputniks* were still circling the Earth, the first being expected to fall in the first days of January.

1958

January 1 Treaties establishing EEC (Common Market) and EAEC (Euratom) came into force; Metric system of weights and measures adopted throughout Japan; **3** Inauguration of West Indian Federation; Sir Edmund Hillary and New Zealand party reached South Pole; **4** *Sputnik I* disintegrated after completing 1,367 circuits of the Earth and travelling 43 million miles; **6** First non-stop flight across Antarctica by single-engine British aircraft (1,600 miles in 10 hr. 57 min.); Mr. Thorneycroft resigned from Government after disagreement in Cabinet over pruning Budget estimates; **7** Mr. Macmillan left for six-week tour of Commonwealth; **8** Summit talks proposed by Marshal Bulganin and Notes sent to 19 States; **13** Over 9,000 scientists from 44 countries petition UN Sec. Gen. to end nuclear weapons tests; **20** Dr. Vivian Fuchs, leader of Commonwealth expedition, reached South Pole; **24** Announcement that Harwell scientists working with ZETA had passed first milestone on road towards power from nuclear fusion; **28** Abolition of licensed prostitution in Italy; **31** First American earth satellite *Explorer I* (30·8 lb.) successfully launched.

February 1 Union of Egypt and Syria in the United Arab Republic; **5** Continuation of Antarctic research for at least 5 years after end of IGY announced; **8** French aircraft bombed Tunisian frontier village of Sakhiet; **14** Merger of Iraq and Jordan under name of Arab Federation; **19** Worst colliery disaster in Indian history in West Bengal; **25** Restoration plans for Stonehenge announced; Campaign for Nuclear Disarmament launched under presidency of Lord Russell.

March 2 IGY Commonwealth Trans-Antarctic Expedition, led by Dr. Vivian Fuchs, completed first crossing of Antarctic (2,200 miles in 99 days); **8** Federal union between UAR and Yemen established; **14** Birth of Prince Albert of Monaco; Small test satellite, *Beta 1958*, successfully launched by US Navy; **20** Bank rate reduced from 7 to 6 per cent; **21** Opening of London planetarium, the first of its kind in Britain; **26** Third US earth satellite, *Explorer III*, successfully launched; **27** M. Khrushchev elected Prime Minister in succession to M. Bulganin; **31** Russian resolution to suspend nuclear tests; other powers invited to follow suit.

April 1 Abolition of legalised prostitution in Japan; **4** Campaign for Nuclear Disarmament organised 50-mile protest march from London to Atomic Weapons Research Establishment at Aldermaston, Berkshire; **14** *Sputnik II* disintegrated over Caribbean, having completed 2,370 circuits of the Earth and travelled 62 million miles; **17** Nationalist Party of S. Africa returned with increased majority; Sir Grantley Adams elected first Prime Minister of the new West Indian Federation; **22** Princess Margaret opened the new Federal Parliament in Trinidad.

May 1 Intense radiation belt in outer space discovered by US *Explorer* earth satellite; **10** Anti-government disturbances in Lebanon; **13** Military and colonist insurrection in Algeria; President of Italy paid state visit to Britain; **15** *Sputnik III* launched under IGY programme; New college to be built at Cambridge University (Churchill College); **22** Further reduction in Bank Rate to 5½ per cent.; **24** Nuclear reactor at Dounreay began working; **29** General de Gaulle accepted invitation to form a "Government of national safety."

June 1 General de Gaulle became Prime Minister of France; Clean Air Act banning emission of dark smoke came into force; **9** Gatwick Airport opened by the Queen; **19** Further cut in Bank Rate from 5½ to 5 per cent.; New British plan for Cyprus announced; **20** London bus strike ended after 7 weeks; **21** Greek Government rejected British plan for Cyprus; **23** Ghana to be declared a republic.

July 1 Conference of scientists, including Russian delegation, met at Geneva to discuss ways of detecting nuclear tests; **14** Iraq monarchy overthrown, King Faisal assassinated; establishment of Republic announced; **15** US marines landed in Lebanon; **17** British troops flown to Amman in response to King Hussein's appeal; **24** First life barons and baronesses under Life Peerages Act named; **26** H.M. the Queen created her son, Charles, Prince of Wales; **31** British Prime Minister sent appeal to all Cypriots to end violence.

August 1 British Government recognised Republic of Iraq; **5** US nuclear submarine *Nautilus* surfaced after having passed under North Pole; **7** Litter Act came into force in Britain; **14** Bank Rate reduced from 5 to 4½ per cent.; **17** First attempt by America to launch moon rocket failed; Britain to resume nuclear tests on Christmas Island; **23** Bombardment by Chinese of Quemoy (Formosa Strait); **29** More American warships join Seventh Fleet in Formosa Strait.

September 1 International conference on peaceful uses of atomic energy opened in Geneva; **7** Britain successfully fired its first ballistic rocket (Black Knight) from Woomera; **15** Ambassadors of America and China met in Warsaw for discussions on Formosa crisis; **16** Relaxations in hire-purchase; **29** Referendum resulted in overwhelming victory for General de Gaulle; Lord Goddard retired as Lord Chief Justice; succeeded by Lord Justice Parker; Gen. Sir Francis Festing succeeded Field-Marshal Sir Gerald Templer as Chief of the Imperial General Staff.

October 1 India began change to metric system; **2** French Guinea proclaimed Republic of Guinea after overwhelming vote for independence in French referendum; **9** Death of Pope Pius XII at age of 82; **11** The London weeklies *John Bull* and *Illustrated* merged; US *Pioneer* space-rocket successfully launched (but failed to reach moon); **21** First women peers introduced to House of Lords; **28** State opening of Parliament and Queen's Speech televised; Cardinal Roncalli, Patriarch of Venice, elected as new Pope John XXIII at age of 76; **31** Conference opened in Geneva (Russia, Britain, and the United States) on suspension of nuclear tests.

November 20 Bank Rate reduced from 4½ to 4 per cent.; **21** Work started on Forth road bridge, the largest suspension bridge in Europe; **27** Russian plan for withdrawal of troops and demilitarised free Berlin.

December 8 Last of four nuclear reactors at Calder Hall brought into operation; **17** Chinese leader, Mao Tse-tung, to resign as chairman of Republic but to retain party office; **18** US 4-ton missile fired into orbit; Empire Day to be known in future as Commonwealth Day; **21** General de Gaulle elected President of France; **27** Partial convertibility between £ and $ announced; UAR and Russia signed agreement on Russian co-operation in Aswan high dam project; **28** General de Gaulle announced devaluation of the franc; **31** IGY officially came to an end.

A.D.

1959

January 1 Batista Government in Cuba overthrown by revolutionary movement under Dr. Fidel Castro; **2** Russia launched planet round the sun (*Lunik I*); **3** Alaska became 49th state of American Union; **4** Mr. Mikoyan, Soviet Dep. Prime Min., arrived in Washington on 16-day visit; Rioting in Leopoldville; **7** Britain recognised new Cuban Government; **8** Gen. de Gaulle installed as first Pres. of Fifth French Republic; **10** Russian proposal for conference of 28 nations to draw up German Peace Treaty; **17** First European Congress for Nuclear Disarmament met at Westminster; **20** Duke of Edinburgh left on world tour; **25** Oecumenical Council, the first since 1870, convened by Pope John XXIII.

February 1 Votes for women rejected by Swiss national poll; **9** University grants to be increased by £8 million 1960–62; New research reactor to be built at Windscale, Cumberland; **11** M. Vincent Auriol resigned from French Socialist Party; **19** Four-year dispute over Cyprus settled at London round-table conference; **20** Disturbances in Nyasaland; **21** Mr. Macmillan arrived in Moscow on official visit; **23** Archbishop Makarios returned to Cyprus after 3-year exile; Cyprus to become a republic with Greek Pres. and Turkish Vice-Pres.; **26** State of emergency declared in Southern Rhodesia; **27** Riots in Malta dockyard due to dismissal of workers.

March 3 American *Pioneer IV* went into planetary orbit round sun; State of emergency declared in Nyasaland; British scientists isolated basic molecule of penicillin; Northern Nigeria became self-governing; **17** Uprising in Lhasa against Chinese rule; Flight of Dalai Lama to India; **24** Iraq withdrew from Baghdad Pact.

April 5 Panchen Lama arrived in Lhasa to take over local government of Tibet; **8** Chair of Criminology founded at Cambridge; **14–16** Worst flood disaster of century in S. America; **15** Resignation of J. Foster Dulles as Sec. of State; succeeded by Mr. Christian Herter; **23** British heart specialists in Moscow to demonstrate heart surgery; **25** St. Lawrence Seaway, linking Great Lakes to North Atlantic, opened to ocean-going vessels; **27** Liu Shao-ch'i succeeded Mao Tse-tung as Chairman (President) of Chinese People's Republic.

May 1 Opening of Rajendra Bridge (6,074 ft.) over Ganges at Hathidah (Bihar); **2** First Scottish nuclear power-station opened at Chapelcross; **7** Local elections in Britain showed Conservative gains; **11** Foreign Ministers' Conference opened in Geneva; **15** Jodrell Bank radioed message to United States via moon; **16** Cambridge Univ. to abolish Latin and Greek as compulsory entrance subjects; **28** Opening of Mermaid Theatre in City of London; **30** Auckland Harbour Bridge officially opened; **31** World's population (2,800 millions) increasing at rate of 45 millions a year.

June 3 Self-government in Singapore; **8** U.S. Post Office made first successful delivery of mail by guided missile; **15** British printing strike began; **17** Mr. de Valera elected Pres. of Rep. of Ireland; Serious riots in African townships in Durban; **18** Five-year plan for Scottish Highlands announced; **23** Iraq withdrew from Sterling Area; **24** World record price (£275,000) paid at Sotheby's for Rubens' *The Adoration of the Magi*; **26** St. Lawrence Seaway formally opened by the Queen and Pres. Eisenhowever; **28** Restoration of Iona Abbey celebrations in Scotland; **29** Norwegian Halden nuclear reactor in operation; **30** U.K. hire purchase debt for June record (£763 million).

July 3 Italy to build nuclear submarine *Guglielmo Marconi*; Tancarville road bridge near Le Havre, longest suspension bridge in Europe, opened; **4** Transatlantic record flight set up by Vickers *Vanguard* turbo-prop airliner (2,500 m. in 5½ hrs.); **5** Recovery in good condition of 3 animals from outer space; **7** Litter Act passed making it an offence to drop litter (fine up to £10); **21** Launching of first nuclear merchant ship *Savannah* by Mrs. Eisenhower; **23** Vice-Pres. Nixon of U.S. arrived in Moscow on visit; **28** £100 tax-free annuity for V.C. holders.

August 16 The Street Offences Act came into force; **21** Baghdad Pact renamed Central Treaty Organisation; **22** First round-the-world service by British airliners inaugurated; **23** Announcement of plan for oil-pipeline network between Soviet Union and East European countries (completion 1963); **27** Pres. Eisenhower in Britain on 5-day visit; Mr. Nehru reported seizure of Indian outposts by Chinese forces; **30** Dalai Lama appealed to U.N.

September 7 Governments of Britain, France, America, and Russia decided to set up new 10-Power disarmament committee to meet at Geneva in March 1960; **11** British loan made available for Malta dockyard; New England to France cross-Channel record set up by Brazilian (12 hr. 49 min. 40 sec.); **13** Russia launched *Lunik II* which landed on moon; **15** Soviet atomic icebreaker *Lenin* made maiden voyage into Baltic; Mr. Khrushchev arrived in New York on 2-week visit; **25** Mr. Bandaranaike, Prime Min. of Ceylon, assassinated; **27** Typhoon in W. Japan (5,000 killed and missing, 1,000,000 homeless); **30** Mr. Khrushchev in Peking for 10th anniversary of Chinese revolution.

October 4 Russia fired *Lunik III*, which took photographs of back of moon; **8** General Election returned Conservatives with 100 overall majority; **10** End of one of longest droughts ever recorded in Britain; **24** Opening of new airport for Wellington, N.Z.; **29** Britain repaid American loan of $250 million 5 years ahead of time; Dublin's famous Abbey Theatre to be rebuilt (destroyed by fire 1951); **30** Soviet Union to spend equivalent of £3,000 million on scientific research in 1960.

November 1 Basic travel allowance for British tourists ended (foreign currency up to £250 a year and further amounts on application to Bank of England); **2** First section of London–Yorkshire motorway (M1) opened to traffic; **5** Philip Noel-Baker awarded Nobel Peace Prize; **8** Sudan and U.A.R. signed agreement on distribution of Nile waters; **17** Announcement of discovery by American scientists of submarine plateau in Arctic Ocean; **19** Bank of England announced introduction of new series of bank notes (10*s*., £1, £5, £10); **12** National Gallery to lend Dublin the Lane pictures; **14** Dounreay fast breeder reactor went into operation; **17** Dr. Adenauer in London for talks; **21** British book exhibition opened in Moscow; **24** CERN's proton synchrotron at Geneva went into full operation generating 24,000 million electron volts (24 GeV.); **27** Duke of Edinburgh opened Ghana's Academy of Learning in Accra; **28** Naval dockyard at Hong Kong closed after 80 years; **30** Inauguration of Italy's first nuclear research reactor; Pink Zone traffic plan went into operation in London.

December 1 Anglo-Russian cultural agreement signed in London; 12-power treaty on Antarctica signed in Washington; State of emergency in Cyprus ended; Bursting of dam at Fréjus killed 384 people; Pres. Eisenhower began tour of Europe, Asia, and Middle East; **5** Opening of 400-mile Sahara pipeline by French Prime Minister; **6** Inauguration of Panchet Hill Dam on Damodar R., Bihar; **9** Diplomatic relations between Britain and Egypt resumed at level of chargés d'affaires; **10** Raising of school-leaving age to 16 recommended by Crowther Report; **13** Poland elected member of Security Council for 1960; **14** Archbishop Makarios elected first Pres. of Cyprus; **15** New world speed record of 1,520 m.p.h. set up by U.S. Air Force pilot; **21** Marriage of Shah of Persia to Miss Farah Diba; **22** Purchase by Japan of British nuclear reactor; **26** Soviet Antarctic expedition reached South Pole; **28** Jugoslavia's first nuclear reactor went into operation; Tokyo reported that in 1959 38 people died in hospital from 1945 Hiroshima atomic bomb attack; **30** East–West summit conference fixed for May 16, 1960.

HISTORICAL CALENDAR (1961)

JANUARY

1 New Year's Day. Circumcision. Elizabeth Blackwell admitted to British Medical Register, the first woman to be so, 1859. Federation of Australia, 1901. Old Age Pensions inaugurated, 1909. Horizontal left to right printing adopted in Chinese newspapers, 1956.

2 Russian rocket launched to become first artificial planet of the sun, 1959.

3 Federation of The West Indies created, 1958.

4 Burma became a Republic, 1948. Trans-Mongolian Railway completed, 1956.

5 Eisenhower Doctrine for the Middle East promulgated, 1957.

6 Epiphany. Twelfth Day. Joan of Arc b. 1412.

7 Britain lost Calais to the French, 1558. First balloon crossing of English Channel, 1785. First telephone service, New York to London, 1927.

8 Galileo d. 1642.

9 Davy miners' safety lamp in use, 1816. Metropolitan Railway opened, the first underground, 1863. Shackleton reached the then "furthest south," 1909.

10 Rowland Hill's scheme of penny postage adopted in Britain, 1840. League of Nations founded, 1920.

11 Ezra Cornell, philanthropist and founder of Cornell University, b. 1807.

12 Aeronautical Society of Great Britain formed, 1866.

13 Hirakud Dam, longest in world, opened, Orissa, 1957.

14 Dr. Albert Schweitzer b. 1875.

15 British Museum opened, 1759. London University degrees opened to women, 1878. Medical benefit under National Insurance Act began, 1913.

16 Prohibition introduced in United States, 1920.

17 John Ray, "father of English natural history," d. 1705. Benjamin Franklin b. 1706.

18 Captain Scott reached South Pole, 1912.

19 Sir Vivian Fuchs reached South Pole, 1958.

20 Simon de Montfort summoned first representative assembly of Parliament, 1265.

21 American atomic submarine, *Nautilus*, launched, 1954.

22 First mail steamer, Calais to Dover, 1822. First (minority) Labour Government, 1924.

23 First use of radio message at sea, following collision of vessels off Nantucket, 1909.

24 Beginning of Boy Scout Movement, 1908. Naval Battle of Dogger Bank, 1915.

25 Conversion of St. Paul. Robert Burns b. 1759.

26 Foundation Day, Australia, 1788. Death of General Gordon at Khartoum, 1885. India proclaimed a Republic, 1950.

27 Mozart b. 1756. Verdi d. 1901.

28 Official announcement on nuclear fusion, 1958.

29 Victoria Cross instituted, 1856.

30 Charles I executed, Whitehall, 1649. Early lifeboat launched at South Shields, 1796. Hitler became German Chancellor, 1933. Assassination of Mahatma Gandhi, 1948. Demonstration of colour television to both Houses of Parliament, 1957.

31 Jupiter C rocket, with first American earth satellite *Explorer*, launched at Cape Canaveral, Florida, 1958.

FEBRUARY

1 Publication of *New* (later *Oxford*) *English Dictionary* began, 1884. National Employment Exchanges opened, 1910.

2 Purification. Candlemas. Treaty of Guadalupe Hidalgo whereby Texas, New Mexico, Arizona, and California became members of the U.S.A., 1848. Agreement for Government to take over national telephone system, 1905.

3 First Parliament of Rhodesia and Nyasaland opened, 1954.

4 Ceylon Independence Day (1948). Yalta Conference (America, Britain, and Russia), 1945.

5 First "breeder" pile in operation at Harwell, 1954.

6 George VI d., Elizabeth II succeeded, 1952.

7 Charles Dickens b. 1812.

8 Mary, Queen of Scots, executed at Fotheringhay, 1587.

9 Nevil Maskelyne, astronomer royal, d. 1811.

10 Samuel Plimsoll, "the sailors' friend," who introduced the Plimsoll mark, b. 1824. Rt. Hon. Harold Macmillan b. 1894.

11 Inaugural meeting for the formation of London University, 1826.

12 Charles Darwin b. 1809. Abraham Lincoln b. 1809. China became a Republic, 1912.

13 Massacre at Glencoe, 1692. Mersey Tunnel opened, 1885.

14 Shrove Tuesday. St. Valentine's Day. First aerial post established in India, 1911.

15 Ash Wednesday. Court of International Justice opened at the Hague, 1922. Singapore surrendered to the Japanese, 1942.

16 Li Hung Chang, Chinese statesman, b. 1823.

17 Tamerlane the Great, Tartar conqueror, d. 1405.

18 Niccolo Paganini, famous violinist, b. 1784.

19 Announcement of discovery of Dead Sea Scrolls, 1948.

20 Luca della Robbia, Italian sculptor, d. 1482.

21 Verdun, 1916. Nikolai Vasilievich Gogol, Russian writer, d. 1852.

22 George Washington b. 1732. Hinkler completed his 16-day London–Australia flight, 1927.

23 Samuel Pepys, diarist, b. 1633.

24 Simplon Tunnel completed, 1905.

25 Capture of Vincennes, Indiana, by George Rogers Clark, leading to opening-up of North-West Territory, 1779.

26 Napoleon escaped from Elba, 1815. Wren d. 1723.

27 First wireless message, England to France, 1899. British Labour Party came into existence (known as Labour Representation Committee), 1900.

28 Relief of Ladysmith, Boer War, 1900.

MARCH

1 St. David's Day.

2 First crossing of Antarctic continent completed by Sir Vivian Fuchs, 1958.

3 Ghana Independence Day (1957).

4 Bank of England began to issue £1 notes, 1797. Forth Bridge opened, 1890.

5 Thames Tunnel completed, 1843. Josef Stalin d. 1953.

6 Michelangelo b. 1475.

7 Alexander Graham Bell received first patent for telephone, 1876.

8 Germans occupied Rhineland, 1936.

9 Amerigo Vespucci, from whom the American continent took its name, b. 1451.

10 Bakerloo line opened, 1906. Air speed record of 1,132 m.p.h. attained, 1956.

11 Hitler entered Austria, 1938. Lease Lend Act, 1941. Sir Alexander Fleming, discoverer of penicillin, d. 1955.

12 Russian Revolution, 1917.

13 Aid to Europe Bill passed American Senate, 1948.

14 Albert Einstein b. 1879.

15 Ides of March. Abdication of Nicholas II of Russia, 1917. Assassination of Julius Caesar, 44 B.C.

16 First meeting of Port of London Authority, 1909. Hitler occupied Czechoslovakia, 1939.

17 Brussels Treaty (Benelux countries, Britain and France), 1948. U.S. Navy vessel, *Vanguard*, put small test satellite into orbit, 1958.

2 John Brown, pioneer of movement to free slaves in America, executed, 1859. Monroe Doctrine proclaimed, 1823. Enrico Fermi (univ of Chicago), achieved first nuclear chain reaction, 1942.
3 Advent. Mary Baker Eddy, founder of Christian Science, d. 1910.
4 Napoleon entered Madrid and abolished Inquisition, 1808.
5 Preston by-pass opened, 1958. Mozart d. 1791.
6 St. Nicholas. Treaty giving Home Rule to Ireland signed, 1921.
7 Japanese attack on Pearl Harbour, 1941.
8 England–Australia air-mail established, 1934. Chinese Nationalist Government transferred to Formosa, 1949.
9 John Milton b. 1608.
10 Royal Academy instituted, 1768. Declaration of Human Rights subscribed to by many nations, 1948.
11 Abdication of Edward VIII, 1936.
12 Marconi transmitted wireless signals across Atlantic, 1901.
13 Dr. Samuel Johnson d. 1784.
14 Women voted for first time in Britain, 1918. Amundsen reached South Pole, 1911.
15 Izaak Walton, author of *The Compleat Angler*, d. 1683.
16 Dingaan's Day, South Africa and Swaziland. Boston Tea Party, 1773. Beethoven b. 1770.
17 Wilbur and Orville Wright made their first flight, 1903. U.S. inter-continental ballistic missile successfully launched, 1957.
18 Antonio Stradivarius, maker of violins, d. 1737.
19 Albert Abraham Michelson, physicist, b. 1852.
20 South Carolina seceded from the Union, the first state to do so, 1860.
21 St. Thomas. Landing of Pilgrim Fathers, 1620. General de Gaulle became President of 5th French Republic, 1958.
22 George Eliot, novelist, d. 1880.
23 Evacuation of Walcheren Island after disastrous landing, 1809.
24 Peace of Ghent between Great Britain and America, 1814.
25 Christmas Day. Vasco da Gama landed in Natal, 1497.
26 St. Stephen. Boxing Day. Russian expedition reached South Pole, fourth party to do so, 1959.
27 St. John Evangelist. United States of Indonesia set up, 1949.
28 Holy Innocents. Tay Bridge disaster, 1879. Opening first section Aswan High Dam, 1959.
29 Thomas à Becket murdered, Canterbury, 1170. Cœlacanth caught off Madagascar, 1952. Second Fire of London, 1940.
30 Josephine Butler, social reformer, d. 1906.
31 Hogmanay. East India Company incorporated, 1600. Government took over national telephone system, 1912.

Story of 1959

THE fifties seemed to culminate with brighter hope in 1959, the last year of the decade. The cold hostility between East and West began to thaw. It was movement which cracked the old rigidity—movement of planets into space and movement of statesmen round the globe.

A Soviet planet was launched round the sun and two Luniks were fired, one of them televising back to earth photographs of the far-side of the moon. This gave the Russian leaders a mounting confidence in their technology, and this confidence seemed to impart a novel geniality into their parleys. Technical progress in both Western countries and in Russia was matched by movement of statesmen, hitherto content to be static, inditing endless Notes. Mr. Macmillan led the way by going to Russia, Mr. Eisenhower came to London, and Mr. Khrushchev went to the United States. After that, political gyrations accelerated—Mr. Eisenhower went to Paris and flew to about a dozen countries, including India.

Thus the politicians began to meet but not yet at the Summit Conference which had been talked about for a couple of years. By the end of the year, however, the date of such a meeting had been fixed for May 1960. The delay was due partly to French hesitations. In January General de Gaulle had been installed as first President of the Fifth Republic of France, and he was anxious to make his own State visits before the Conference and to receive Mr. Khrushchev.

During the year the concept of a Summit Conference was transformed. Instead of an occasion for a once-for-all agreement it was thought more feasible, perhaps, to introduce a new era of periodical summit meetings. The new circulation of statesmen and the geniality which began to be engendered took effect. Indeed, Mr. Eisenhower said he would visit Russia immediately after the first summit meeting.

A further hopeful feature of the year was the growing dislike by the smaller Powers of nuclear tests. They united to call on the nuclear Powers to continue their "voluntary discontinuance of tests." There were indeed, so far as can be known, no tests in 1959; but Mr. Eisenhower declined, at the end of year, to renew his pledge not to resume tests while the negotiations were continuing at the Geneva Conference. France had not yet made her promised (or threatened) atomic explosion in the Sahara.

Fear of war shifted to the East, where difficulties between China and India arose on Tibet and in the Himalayas. Fighting had broken out in March between Tibetans and Chinese in Lhasa, and Tibet declared itself independent. But the Chinese dissolved the Tibet Government, and the Dalai Lama flew to India for asylum. The tragic anomaly continued whereby China was excluded from the United Nations.

After bitter and costly strife the three parties to the Cyprus dispute suddenly saw the blessedness of conciliation, but in two other areas differences were aggravated. Representative government was suspended in Malta; and in Nyasaland emergency powers were taken by the Government after riots in which thirty-six Africans were killed and Dr. Hastings Banda arrested.

At home there was a dramatic turn both in industry and in politics. Unemployment fell to its normal post-war level of about 2 per cent and production increased. Mr. Macmillan chose the autumn for a General Election, and amidst a babel of mass-opinion pollsters the Conservatives were victorious for the third consecutive time, with a majority of 100 seats over all. There was a small but significant drop in the Labour vote, Scotland and the industrial north-west of England withstanding the general trend.

One of the aspects of the election which puzzled observers was the apparently slight impact on the mind of the electorate of the events in Nyasaland and the deaths caused by violence in Hola Camp in Kenya. *The Times* wondered whether this was due, in part, to an atrophy of public conscience. Does increasing well-being bring with it an indifference to the welfare of the far less fortunate? Before answering one should recall the response given to the appeal on behalf of refugees during the World Refugee Year, which began in the summer.

Certainly the year marked the end of a decade of considerable material progress. Ten years earlier Britain was still struggling out of the aftermath of war, and food was still rationed. At the end of the decade motor cars, television sets, refrigerators, and washing machines were being increasingly acquired. More importantly, the expectation of life at birth rose from 68 in 1949 to 70·5 in 1959.

Oxford University gave their women's colleges equal status with the men's. But a proposal for votes for women in Swiss Federal elections was rejected on a referendum. Two members of an all-women expedition died on Cho Oyu, a Himalayan Peak.

The Queen gave Marlborough House to the nation as a Commonwealth Centre in London; and Mr. Isaac Wolfson gave £150,000 to found a Chair of Criminology at Cambridge.

A *Daily Mail* prize for the quickest journey from Marble Arch, London, to the Arc de Triomphe, Paris, was won by Squadron-Leader Maughan in 40 minutes 44 seconds.

Among those who died during the year was a distinguished scholar who had the rare gift of being able to make technical problems clear to ordinary men and women—Professor G. D. H. Cole of Oxford. His death was a particular loss to *Pears*, for which he had contributed an outline of the economic problems of the day. Among artists who died were Sir Matthew Smith, Sir Stanley Spencer, and Sir Jacob Epstein, perhaps the greatest sculptor of the age. Literature lost Laurence Housman, a man of unusual moral courage. Grock the clown died, and the whole world recalled his skill.

Grumblers were silenced for a time by a glorious summer from early May to early October, and they soon forgot to lament that Australia had won back the Ashes. The prolonged sunshine helped to soften the difficulties and misgivings of a politically distracted world.

On Christmas eve, however, a Cologne synagogue was desecrated by anti-Semites. Followed as it was by similar outrages elsewhere, the incidents caused considerable foreboding. It was a disturbing note for the year to die upon.

Lives and leading achievements of distinguished
men and women of all ages and countries

Prominent People

A

Abbot, George (1562–1633), Archbishop of Canterbury in 1611, and one of the translators of the authorised version of the Bible.

Abdullah ibn Husein (1882–1951); King of Jordan; made ruler under the British mandate in 1921 and proclaimed King in 1946 when Transjordan (renamed Hashimite Kingdom of the Jordan in 1949) was created an independent state by treaty with Britain. His assassination in 1951 removed a friend of Britain and a wise and constructive statesman of the Arab world.

A'Becket, Thomas. (*See* **Becket, Thomas A'**.)

Abelard, Peter (1079–1142), mediæval philosopher and divine, born near Nantes, pupil of William of Champeaux, the most celebrated dialectician of the day. Unrivalled in philosophy, he acquired great popularity as a teacher and attained great scholastic glory. His romance with Heloïse, niece of Canon Fulbert, has been much written about and will be familiar to most readers. The Canon had Abelard castrated and they retired from the world, he to the monastery at St. Denis and she to a nunnery at Argenteuil. The correspondence between Abelard and Héloise has been published. Their remains now lie in one tomb at Père la Chaise, to which they were removed after the Revolution.

Abercrombie, Lascelles (1881–1938), English poet and critic. Professor of English Literature at London University, 1929–35; Lecturer in Poetry at Queen's University, Belfast, 1931–32. Author of many noteworthy publications.

Abercrombie, Sir (Leslie) Patrick, M.A., F.S.A. F.R.I.B.A. (1879–1957), architect and town-planner. Brother of the above. Lever Prof, of Civic Design at Liverpool, 1915–35; Prof. of Town Planning at University College, London. 1935–46. Consulted on the replanning or Plymouth, Hull, Bath, the Clyde Valley, Dublin, Addis Ababa, Colombo, and Cyprus. Produced the famous plan for Greater London, 1943.

Acheson, Dean Gooderham, A.B., LL.B. (b. 1893), U.S. Secretary of State in the Truman Administration, 1949–52.

Acton, John Emerich Edward Dalberg, 1st Baron, K.C.V.O., D.C.L., LL.D. (1834–1902), English historian and brilliant scholar; Professor of Modern History at Cambridge, 1895–1902.

Adam, Robert (1728–1792), one of four Scottish brothers, all distinguished architects. Developed a characteristic style in planning and decoration and designed many important public and private buildings and interiors. His achievements include the great aristocratic houses of Harewood, Yorks; Osterley, Middlesex; Syon, Middlesex; Kedleston, Derbyshire.

Adams, John (1735–1826), succeeded Washington as President of the United States, and was the first of the Republic's ambassadors to England.

Adams, John Couch, F.R.S. (1819–92), English mathematician and astronomer. Shared credit for discovery of the planet Neptune, 1846, with the French astronomer, Leverrier (1811–77).

Adams, Samuel (1722–1803), American statesman, known as the "American Cato," who worked all his life for American Independence and signed the Declaration (1776). He organised the "Boston Tea Party."

Addams, Jane, B.A., M.A. (1860–1935), famous American sociologist who founded Hull House, Chicago, in 1889.

Addison, Christopher, 1st Viscount, K.G. P.C. M.D., F.R.C.S. (1869–1951). After joining the Labour Party held successive Ministerial offices in 3 Labour Governments and became leader of the House of Lords. Forsook his profession as professor of anatomy at Sheffield Univ. for a political career because of his great interest in public health and social reform.

Addison, Joseph (1672–1719), achieved fame both as a writer and a politician. Held many offices under various governments; contributed to the *Tatler* started by his friend Steele and with him founded the *Spectator*. His tragedy *Cato* was a brilliant success.

Adeler, Max (1841–1915), the famous American humorist who wrote, among other works, *Out of the Hurly Burly* (1874) and *Elbow Room*.

Adenauer, Dr. Konrad (b. 1876), Chairman of the Christian Democratic Union and its founder in 1945; Chancellor of the West German Federal Republic since 1949.

Adler, Alfred (1870–1937), Austrian physician and psychiatrist and founder of the school of individual psychology. An earlier pupil of Freud, he broke away in 1911, rejecting the emphasis on sex, and regarding man's main problem as a struggle for power to compensate for feelings of inferiority.

Adrian, Edgar Douglas, 1st Baron, O.M., M.A., M.D., F.R.S., F.R.C.P. (b. 1889), Prof. of Physiology, Cambridge Univ. 1937–51; Master of Trinity Coll., Cambridge, 1951; Pres. of the Royal Society 1950–55; Pres. of the British Association, 1954; Installed as Chancellor of Leicester University, 1958. Nobel Prize for Medicine, 1932.

Æschylus (525–456 B.C.), father of Greek tragic drama. Composed seventy plays and gained the prize for dramatic excellence thirteen times.

Æsop, name famous for the fables preserved principally through Babrius (2nd century A.D.). About him nothing is known; according to legend he was a Greek slave in the 6th century B.C. who had a number of wild adventures.

Aga Khan, Sultan Sir Mahomed Shah, P.C., G.C.S.I., G.C.M.G., G.C.I.E., G.C.V.O. (1877–1957), spiritual head of the Ismailis, an Islamic sect scattered over Asia and Africa. Direct descendant of the prophet Mohammed and third holder of the title "Aga Khan." He was a great lover of the turf, and was the owner of five Derby winners. Succeeded by his grandson, Prince Karim (b. 1936).

Agassiz, Louis Jean Rodolphe (1807–73), Swiss-American naturalist and authority on ichthyology. He was the author of a five-volume work on *Researches on Fossil Fishes* (1833–43), and his scientific investigations into the movements of glaciers resulted in *Studies on Glaciers* (1840). His great work, *Contributions to the Natural History of the United States*, was left unfinished.

Agricola, Gnæus Julius (A.D. 37–93), became Roman Consul of Britain A.D. 78. Strengthened the power of the Romans in this country, correeted many abuses, and did much to encourage trade and industry. Remained in Britain 7 years.

Agrippa, Marcus Vipsanius (63–12 B.C.), the greatest military commander of Rome after Julius Cæsar.

Aird, Sir John, Bart. (1833–1911), contracting engineer of eminence, associated with many great undertakings in different parts of the world, the Aswan Dam on the Nile, completed in 1902, being one of his most remarkable achievements.

Airy, Sir George Biddell, K.C.B., F.R.S. (1801–1892), Astronomer Royal (1835–1881) at Greenwich Observatory, where his brilliance and industry led to many important researches.

Akbar, Jalal-ud-din Mohammed (1542–1605), the greatest and wisest of the Mogul emperors and one of the great figures of history. He initiated economic and social reforms and succeeded in unifying his vast empire. His courts at Delhi and Agra were centres of culture and learning.

Alanbrooke, Field-Marshal Viscount, K.G., G.C.B., O.M., G.C.V.O., D.S.O. (b. 1883). Chief of Imperial General Staff, 1941–46; Chan. Queen's Univ., Belfast. Pub. *Turn of the Tide* and *Triumph in the West, 1943–46* (War Diaries edited by Sir Arthur Bryant).

Alaric I (376–410), the famous chief who led the Visigoths against the Romans, and afterwards invaded both Greece and Italy. He took Rome in 410, died the following year, and was buried with a vast treasure in the bed of the River Busento, and so that the Romans might not discover his remains, the slaves who buried him were put to death.

Alban, St., who flourished in the latter part of the 3rd century, was born at Verulamium (where St. Albans now stands) and served as a soldier under Diocletian at Rome. Later he was converted to Christianity, and was for a time a renowned preacher of that religion, finally suffering martyrdom. Offa, king of the Mercians, built a monastery to his memory near Verulamium, four or five hundred years later. St. Alban's Day in the Calendar of the Roman Church is June 22nd, and in that of the Anglican Church June 17th.

Albani, Madame (1852–1930), stage name of Marie Louise Emma Lajeunesse, Canadian operatic soprano. Made her first appearance in England at Covent Garden in 1872 and was for many years a leading prima donna, achieving great celebrity as Elsa in *Lohengrin*.

Albert, Prince Francis Augustus Charles Emmanuel, Consort of Queen Victoria (1819–1861). On his marriage with the Queen in 1840 Parliament granted him an income of £30,000 a year. The prince adapted himself with considerable success to the difficulties of his position, and gradually secured the confidence and esteem of statesmen and public alike. The great Exhibition of 1851 owed much of its success to his efforts. He died of typhoid fever in December, 1861. The Albert Memorial forms a national tribute to his memory.

Albertus Magnus, St. (1206–80), Dominican scholastic philosopher, b. Bavaria, one of the great mediaeval university teachers and the most learned man of his time. St. Thomas Aquinas was his favourite pupil. Took scientific interest in nature and made notable botanical observations.

Alcibiades (*c.* 450–404 B.C.), treacherously killed in battle at Melissa, Phrygia, was the celebrated Athenian statesman and general, pupil and friend of Socrates.

Alcock, Sir Walter Galpin, M.V.O., Mus. Doc., F.R.C.O. (1861–1947), English musician, eminent both as organist and composer of church music. He played at the Coronations of King Edward VII, King George V and King George VI. Organist to Salisbury Cathedral, 1916–47, and Professor of Organ at Royal College of Music, 1893–1939.

Alcott, Louisa May (1832–88), American authoress; the charm and naturalness of her writings made her a favourite among children's authors, and her books are still read on both sides of the Atlantic. Her most famous book, *Little Women*, appeared in 1868.

Alcuin (735–804), scholar and ecclesiastic, was a leader of the Carolingian Renaissance. His works include poems and historical and theological writings.

Aldred (d. 1069), a powerful ecclesiastic of the 11th century in great favour with the Conqueror, whom he crowned. Bishop of Worcester (1044–60), and Archbishop of York (1060–1069).

Alekhine, Dr. (Aljechin) Alexander (1892–1946), world chess champion, 1927–35, 1937–46.

Alembert, Jean le Rond d' (1717–1783), a Parisian mathematician and philosopher who achieved great eminence by his numerous scientific works, including the *Theory of the Winds* and the *Precession of the Equinoxes*.

Alexander of Hillsborough, Viscount, P.C., C.H. (b. 1885), Chan. of Duchy of Lancaster, 1951; Min. of Defence, 1946–50; First Lord of the Admiralty, 1929–31 and 1940–46.

Alexander of Tunis, Field-Marshal Earl, P.C., K.G., G.C.B., O.M., G.C.M.G., D.S.O. (b. 1891), soldier and statesman. Commander of 1st Div. at Dunkirk; C.-in-C. Southern Command, 1940–42; G.O.C. in Burma, 1942, when he conducted a masterly retreat; C.-in-C. Middle East, 1942–43, when he was largely responsible for driving the enemy out of North Africa; C.-in-C. Allied Armies in Italy, 1944; and Supreme Allied Commander, Mediterranean, 1944–45, when he successfully led a force drawn from many different nations. Gov.-Gen. of Canada, 1946–52; Min. of Defence, 1952–54.

Alexander II. of Russia (1818–1881), succeeded his father, the Emperor Nicholas, in 1855. In 1861 he emancipated 23 millions of serfs. On March 13, 1881, was assassinated by bombs thrown beneath his carriage in St. Petersburg by Nihilists.

Alexander the Great (356–323 B.C.). King of Macedon, succeeded his father Philip in 336 B.C., and from the first showed himself fitted for mighty military exploits. He conquered in turn the Thebans, the Persian Satraps, overthrew Darius, overran Syria and Phœnicia, possessed himself of all the cities along the Mediterranean, conquered Egypt, founded Alexandria, and finally retired upon Babylon, where he died eleven days later.

Alexandra, Queen (1844–1925), d. of Christian IX. of Denmark, married to the Prince of Wales (afterwards Edward VII.) on March 10,1863. Queen from Jan. 22, 1901, to May 6, 1910.

Alfieri, Count Vittorio (1749–1803), the Italian poet, was the author of twenty-one tragedies and six comedies.

Alfonso the Wise (1221–1284), a celebrated King of León and Castile, founder of the legal code which became the basis of Spanish jurisprudence, a liberal patron of literature and science, particularly of astronomy; dethroned by his son Sancho in 1282.

Alfred the Great (849–99), king of Wessex, son of Aethelwulf; succeeded his brother as king in 871 and found himself in conflict with the Danes from the outset. After six years of unsuccessful effort he took refuge in the Isle of Athelney, but the following year defeated the Danes in great force at Edington (Ethandun). Later, the Danes again invaded the country, and the rest of Alfred's reign was occupied in conflict. Besides being a great warrior he was a man of letters, a philosopher, and a very able legislator and administrator. He was buried at Winchester.

Allenby, Field-Marshal Viscount, G C.B., G.C.M.G., G.C.V.O. (1861–1936), brilliant cavalry soldier. Served on Western front, 1914–16; commanded in Palestine, 1917–18, capturing Jerusalem on December 9th, 1917. High Commissioner for Egypt, 1919–25.

Alleyne, Edward (1566–1626), a famous actor, contemporary of Shakespeare and founder of Dulwich College.

Alma-Tadema, Sir Lawrence, O.M., R.A. (1836–1912), the son of a Netherlands notary, he came to England in 1869, where he soon made a name for himself as a painter of classical pictures of great beauty of colour and delicate design.

Ampère, André Marie (1775–1836), a celebrated French mathematician who devoted himself successfully to the study of electricity and magnetism, and was the first to propound the electro-dynamic theory.

Amundsen, Captain Roald (1872–1928). Norwegian explorer, the first to navigate the North-west Passage and the first to reach the South Pole. Sailing in the fishing smack *Gjöa*, he negotiated the North-west Passage in the 3 years, 1903–6. In 1911 he sailed south in the *Fram* and reached the Pole on December 14th, 1911, a month before his English rival Scott. He failed to complete a flight across the North Pole in 1925, but succeeded the next year. He lost his life in the Arctic while attempting to rescue Nobile, who had crashed in the *Italia*. *See also* **Antarctic Exploration**, Gen. Inf.

Anacreon (*c.* 560–475 B.C.), the celebrated Greek poet whose Odes hold a high place in poetic literature.

Anaxogoras (488–428 B.C.), Greek philosopher of Ionia who came to Athens 464 B.C. He inspired Pericles and the poet Euripides with his great love of science, and is said to have been the teacher of Socrates, who, however, differed from him.

Anaximander (611–547 B.C.), Greek philosopher of Miletus in Asia Minor, pupil of Thales. He was the first among the Greeks to make geographical

maps, and to speculate on the origin of the heavenly bodies; he introduced the sun-dial from Babylon or Egypt.

Andersen, Hans Christian (1805–1875), perhaps the most gifted writer of fairy tales the world has known. *Mit Livs Eventyr* (The Story of My Life) is as interesting as his fairy tales, which include *The Ugly Duckling, The Little Mermaid, The Emperor's New Clothes, The Little Match-seller*. Born and died in Denmark.

Anderson, Elizabeth Garrett, M.D. (1836–1917), one of the first English women to enter the medical profession. Practised in London for many years. In 1908–9 was Mayor of Aldeburgh, her native town, and the first woman to be a mayor.

Andrea del Sarto (1487–1531). This celebrated son of a Florentine tailor was one of the great Italian artists of his time, known as the "faultless painter." Most of the famous galleries of the world contain examples of his magnificent fresco and other painting, mainly dealing with religious subjects.

Andrée, Salomon August (1854–1897), a Swedish explorer who attempted in 1897 to reach the North Pole by balloon, but, except for a message by pigeon despatched two days after his ascent, was not heard of again until in August 1930 a Norwegian scientific expedition led by Dr. Gunnar Horn discovered the remains of the Andrée expedition on White Island. The discovery included a log-book, sketch maps and the diaries kept by Andrée. A translation of these was published in England in 1931.

Andrew, Saint, one of the apostles of Jesus, brother of Simon Peter, whose festival is observed on November 30th. He became the patron saint of Scotland in the eighth century.

Angelico, Fra (1387–1455), a famous Italian painter of religious subjects, mostly in the form of frescoes, of which the best examples are at Florence.

Angell, Sir Norman (b. 1874), author and publicist, whose works include *The Economic Chaos* and *The Peace Treaty* (1919), *The Great Illusion* (1910) and *The Money Game* (1928). Nobel Prize for Peace 1933.

Angström, Anders Jonas (1814–74), Swedish physicist, whose life was devoted to the study of heat, magnetism and spectroscopy, and in all three he contributed greatly to scientific knowledge. The unit used for measuring the wavelength of light was named *Angstrom* in his honour.

Anne, Queen (1665–1714), Queen of Great Britain and Ireland from 1702 to the time of her death, was a daughter of James II., and succeeded William III., her cousin. During her reign England, in alliance with Austria, Holland, Prussia, Savoy, and Portugal, entered upon the War of the Spanish Succession. Anne's reign has been called the Augustan Age of Britain because of the many eminent men of letters who flourished during that period. She was the last of the Stuarts to occupy the British throne. The most important domestic event of her reign was the passing of the Act of Union with Scotland in 1707.

Anouilh, Jean (b. 1910), most successful contemporary playwright in France; writes in the French classical tradition of happiness, conflict, and suffering. Several plays have been translated into English, including *Roméo et Jeannette* (Fading Mansion), *Eurydice* (Point of Departure), *L'Invitation au Château* (Ring Round the Moon), and he has made a number of films, including *M. Vincent* and *Pattes Blanches*.

Anselm St. (1033–1109), Archbishop of Canterbury, was a native of Aosta, and succeeded Lanfranc as English Primate. He was in serious conflict with William Rufus on the question of ecclesiastical rights, and for a time suffered exile. Under Henry I., he regained power, making a compromise with that monarch which enabled him to carry on his theological work in comparative harmony. He died at Canterbury, and was canonised in 1494, his day being celebrated in the Roman Church on April 21st.

Anson, George, 1st Baron (1697–1762), a navigator of great eminence, whose *Voyage round the World* is still a popular book of adventure. He won many victories, obtained a peerage, rose to full Admiral's rank in the Navy, and served two terms as First Lord of the Admiralty.

Antoninus Pius (86–161), Emperor of Rome from A.D. 138 to 161, was the successor of Hadrian, and formed an agreeable contrast to most of the Roman Emperors, in that he endeavoured to govern more with an eye to the public well-being than his own personal pleasure. It was during his reign that the wall between the Forth and Clyde was built.

Antonius Marcus or **Mark Antony** (*c.* 83–30 B.C.), celebrated Roman Triumvir and General; a warm supporter of Cæsar; but engaged in intrigues after the latter's death, and was opposed by Brutus and Cassius. His association with the Egyptian Queen Cleopatra is the subject of Shakespeare's play. Committed suicide after defeat by Octavian.

Antony, St. (or **Anthony**) (*c.* 251–356), was a native of Upper Egypt, and according to his own account spent much time in conflict with the devil. He is one of the best-known saints of the Roman calendar, and his festival is on January 17th. He was believed to give relief to those who appealed to him when suffering from erysipelas, from which tradition the name St. Anthony's Fire is given to the disease.

Apelles, Greek painter, the most celebrated of antiquity, who flourished in the 4th century B.C. at the time of Alexander the Great. His most famous pictures, which have not survived, are of Alexander wielding the thunderbolts of Zeus and of Aphrodite rising from the sea.

Appert, Nicholas (1752–1841), sometimes known as François Appert, invented the method of preserving animal and vegetable foods by means of hermetically sealed cans or tins. He had no scientific training, but his painstaking work and countless experiments bore the mark of a true scientist. His revolutionary methods paved the way for the creation of a vast world industry which cans millions of tons of food a year.

Appleton, Sir Edward Victor, G.B.E., K.C.B., D.Sc., F.R.S. (b. 1892), physicist. From 1920 worked under Rutherford at Cambridge. His researches into the propagation of wireless waves led to a great advance in this branch of science. Awarded Nobel Prize for Physics in 1947; Pres. Brit. Ass., 1953.

Aquinas, Thomas St. (1225–1274), the "Father of Moral Philosophy," was a native of Southern Italy and came of a noble family. In 1243 he joined the Dominicans, and the remainder of his life was spent in religious pilgrimages and disputations. In 1263 he visited London. He left behind him numerous theological and philosophical writings of great power. He was canonised in 1323.

Arago, Dominique François Jean (1786–1853), a French astronomer and natural philosopher of great eminence, whose researches added much to our knowledge of electricity and magnetism. His expositions of the polarisation of light did much to advance that branch of science.

Archer, Frederick James ("**Fred**") (1857–1886), a favourite jockey for several years, winner of many leading races, his first Derby falling to him in 1877. Rode 2,748 winners during his turf career.

Archimedes (287–212 B.C.), Greek mathematician, physicist, and inventor, to whom we are indebted for his discoveries in mechanics (notably the lever), hydrostatics (floating bodies), and for the invention of the famous Archimedean screw. He lived most of his life in Syracuse, and was killed there during the siege by the Romans under Marcellus.

Argand, Aimé (1755–1803), inventor of the lamp bearing his name, which for the first time introduced a current of air to permeate and increase the power of the flame, by using a chimney glass and circular wick. He was a Swiss physician.

Ariosto, Ludovico (1474–1533), the author of *Orlando Furioso*, was one of the most celebrated of the Italian poets. In addition to his famous epic he wrote many comedies, satires and poems.

Aristeides (or **Aristides**), a Greek writer, and founder of the school of prose romance; flourished in the 2nd century B.C. His *Milesian Tales* are among the most celebrated works of fiction.

Aristides (530–467 B.C.) the Athenian general, was of noble descent, and first achieved fame at the battle of Marathon, 490 B.C. He was renowned no less for his valour than for his scrupulous

honesty and a desire to do justice to others; hence he was surnamed "the Just."

Aristippus (*c.* 435–356 B.C.), founded the Cyrenaic school of philosophy, which taught that sensual pleasure was the only happiness. He was a native of Cyrene, in Africa, but became a pupil of Socrates, and settled in Athens.

Aristophanes (*c.* 444–*c.* 385 B.C.) was one of the foremost Athenian play-writers and the greatest of the Greek comic poets. He is said to have composed fifty-four plays in all. Eleven of these only have survived. They are full of satire, and deal unsparingly with the people and institutions of his time.

Aristotle (384–322 B.C.), Greek philospher, pupil of Plato, after whose death in 347 he left Athens to become tutor to the young prince Alexander of Macedon. Subsequently at Athens he established his famous school in the garden known as the *Lyceum*, where he lectured in the *peripatos* (cloister) which gave it its name *Peripatetic*. He took the whole field of knowledge as his subject, giving it unity, and providing a philosophy which held its own for 2,000 years.

Arkwright, Sir Richard (1732–1792), was a native of Preston, and in early life a barber and travelling hairdealer. Becoming interested in mechanical problems, he set himself the task of inventing an improved cotton-spinning machine. Hargreaves' spinning-jenny was then the leading machine, but the yarn it produced could only be used for weft; it was not compact enough for warp threads. Arkwright therefore experimented until, by adopting an arrangement of rollers that moved with different velocities, he succeeded in perfecting his "spinning-frame," which successfully produced a yarn that could be used for warp as well as for weft. He took out his first patent in 1769, and entering into partnership with Mr. Jehediah Strutt, of Derby, became a manufacturer on a large scale, in 1771 establishing the first spinning-mill worked by water-power.

Arne, Dr. Thomas Augustine (1710–1778), English composer of considerable merit and of great popularity in his day. He composed numerous ballad operas, and at Drury Lane, Covent Garden, and Vauxhall organised the chief performances for long periods. His best-known opera was *Artaxerxes*, and his most popular songs were *Rule, Britannia!* and *Where the Bee Sucks*.

Arnold, Matthew (1822–1888), son of Dr. Thomas Arnold, achieved a high reputation as poet and critic. As the propounder of the principles of "sweetness and light," as well as by his graceful verse, he secured a high place amongst the literary men of the Victorian era.

Arnold, Thomas, D.D. (1795–1842), headmaster of Rugby from 1828 to his death. His influence at Rugby was such as to give that institution a supreme position among English public schools. A man of intense spiritual feeling, of a sympathetic and lovable nature, yet possessed of all the necessary attributes of scholarship, he was greatly esteemed and venerated.

Arrhenius, Svante August (1859–1927), Swedish chemist, one of the founders of modern physical chemistry. Received 1903 Nobel Prize for originating the theory of electrolytic dissociation (ionisation). Director of the Nobel Institute, 1905–27.

Arrol, Sir William (1839–1913), well-known contractor and engineer, whose firm built the Tay, Forth, and London Tower Bridges as well as the Manchester Ship Canal. Originally a piecer in a cotton-mill, and later a working blacksmith.

Artaxerxes was the name borne by several ancient Persian kings, some of whom achieved great distinction. The first Artaxerxes was the son of Xerxes, and reigned from 464 B.C. for 40 years; he was succeeded by Darius II. (424–404 B.C.), who in turn was followed by Artaxerxes II., who reigned until 358. Artaxerxes III, the last to bear the name, was a cruel and treacherous man and was poisoned in 338.

Arthur, fabled Celtic warrior of *c.* A.D. 600, the first reference to whom is in the 9th-cent. chronicle of Nennius, who speaks of his 12 victorious battles against the invading Saxons. His legend developed into a vast literature in mediaeval times, which was welded together by Sir Thomas Mallory in his great work *Morte d'Arthur*.

Arundel, Thomas, Archbishop of Canterbury (1353–1414), in the reigns of Richard II, and Henry IV, previously Bishop of Ely and Archbishop of York, and for a time Lord Chancellor. An active politician and bitter enemy of heresy.

Ashfield, Lord, P.C. (1874–1948), President Board of Trade, 1916–19; M.P. Ashton-under-Lyne, 1916–20; appointed first Chairman of the London Passenger Transport Board created in 1933.

Aske, Robert, the leader of the Pilgrimage of Grace, directed against the Reformation; executed 1537.

Asoka (273–232 B.C.), Emperor of India (*c.* 255–*c.* 237 B.C.), and the most powerful ruler of his time, his Empire extending from the Himalayas to what is now Madras. He was the first ruler to embrace Buddhism and accord it recognition. Becoming a Buddhist (*c.* 257 B.C.) he turned aside in disgust from the thought of his earlier military conquests, and attempted by missionary propaganda to spread Buddhism throughout his lands. There are some 35 valuable and interesting inscriptions on rocks and pillars, etc., mainly of religious or moral import. He gave great impetus to Buddhism by organising it as the state religion.

Asquith, Herbert Henry, 1st Earl of Oxford and Asquith (1852–1928), Liberal statesman; Home Sec. in Gladstone's 1892–95 government; Chancellor of the Exchequer in Campbell-Bannerman's government; introduced first provision for old-age pensions and succeeded as Prime Minister in 1908, which office he held until 1916. Resigned leadership of Liberal Party in 1926. His second wife, Margot (Tennant) Asquith, who died in 1945, held a high position in London society for her wit and brilliance.

Asser, a Welsh monk of the tenth century, author of a remarkable life of King Alfred.

Astor, John Jacob (1763–1848), the founder of the Astor family of millionaires, was a native of Heidelberg, and emigrating to America, went out to the North-West and began trading in furs, soon building up a large fortune, which he wisely invested in New York real estate, which rapidly increased in value.

Astor, Nancy Witcher, Viscountess, C.H. (b. 1879), widow of the 2nd Viscount Astor (1879–1952). First woman M.P. to take her seat in the House of Commons, an American by birth.

Atatürk, Kemal (1881–1938), builder of modern Turkey. A fine soldier, he defended the Dardanelles against the British in 1915 and drove the Greeks out of Turkey in 1922. President of the Turkish Republic, and virtually dictator 1923–38.

Athanasius, St. (296–373), was Bishop of Alexandria. He spent much of his time in bitter theological controversy, and was driven from Alexandria; taking refuge in the desert, he wrote numerous letters in support of Christian doctrine, and under Julian was recalled to Alexandria. The Athanasian creed is supposed to reflect his belief.

Athelstan (895–940), grandson of Alfred the Great, was crowned King of England in 925, and was the first ruler of all England.

Atherstone, William Guybon (1813–98), South African geologist and an originator of the South African diamond industry. He drew attention to the possibility of diamonds near Kimberley and in 1867 identified a crystal found near the Vaal River, thus helping to start mining development. Was for many years a member of the Cape Parliament.

Attila (406–453), King of the Huns, was a warlike leader, who achieved many conquests over the Roman forces, committing great ravages and laying large tracts of country waste. He marched through Germany and Gaul, and died as he was preparing for another invasion of Italy.

Attlee, Clement Richard, 1st Earl, O.M., K.G., P.C., C.H. (b. 1883), Prime Minister in two successive Labour Governments, 1945–51; served as Deputy Prime Minister to Mr. Churchill, 1942–45. He was educated at Haileybury and University Coll., Oxford. Called to the Bar in 1905; tutor and lecturer in social science at the London School of Economics, 1913–23. Became Mayor of Stepney in 1919, Labour M.P. for Limehouse in 1922, and Parliamentary

Leader of the Labour Party, 1935–55. During his Premiership the welfare society was established and the freedom and independence of India granted. Responsible for the system of Cabinet committee organisation. Retired in 1955 and created an Earl. His autobiography, *As it Happened*, was published in 1954.

Auber, Daniel François Esprit (1782–1871), a distinguished French composer of light operas, *Masaniello*, *Fra Diavolo*, *Le Domino Noir*, etc.

Auchinleck, Field-Marshal Sir Claude J. E., G.C.B., G.C.I.E., D.S.O. (b. 1884), Indian Army officer who was C.-in-C. Middle East, 1941–42, and the last British C.-in-C. in India, 1943–46.

Auden, Wystan Hugh (b. 1907), influential modern poet, born in England and naturalised an American. His work includes verse plays as well as poems and he edited *The Oxford Book of Light Verse*. Succeeded C. Day Lewis as Prof. of Poetry, Oxford Univ., 1956.

Auer, Leopold (1845–1930), the famous Hungarian violinist and teacher of the violin, among his pupils being Mischa Elman and Jascha Heifetz. Was Professor of the violin at the St. Petersburg Conservatory for nearly fifty years (1868–1917).

Augustine, St., of Hippo (354–430), was born at Tagaste in Africa of a pagan father and a Christian mother, but went to Rome, and under the influence of St. Ambrose became deeply religious, writing much upon doctrinal subjects. His works include *The City of God* and *The Confessions*.

Augustine, St., was the missionary monk who was sent to Britain by Gregory the Great in 597. He succeeded in converting King Ethelbert, after which he made good progress with the people generally, and became the first Archbishop of Canterbury. He died in 604.

Augustus, Caius Octavianus (63 B.C.–A.D. 14), was the first Emperor of Rome, succeeded Julius Cæsar. After a triumvirate of twelve years, in which he was associated with Mark Antony and Lepidus, he became supreme ruler and for forty-five years exercised a beneficent and powerful sway. He was a devoted patron of Horace and Virgil. The Augustan Age is still held among the most memorable in the history of letters.

Aurelius, Marcus Antoninus. *See* **Marcus Aurelius Antoninus.**

Auriol, Vincent (b. 1884), French politician. Voted against surrender in 1940, was interned and escaped to London in 1943. President of the French National Assembly, 1946, and of the Fourth Republic, 1947–54.

Aurungzib (1618–1707), the last of the Great Moguls, Emperors of Hindustan; succeeded his father Shah Jehan in 1658 and reigned until his death. He was a ruler of ability, and greatly extended his empire by conquest, but his zeal for Mohammedanism aroused the hatred of the Hindus, and when he died the disruption of the vast Mogul territory followed rapidly.

Austen, Jane (1775–1817), author of *Emma*, *Mansfield Park*, *Northanger Abbey*, *Persuasion*, *Pride and Prejudice*, and *Sense and Sensibility*. Though confining herself to the personal relations of the English middle classes, she combined artistry, accuracy, imaginative power, satiric humour, sense, and genuine feeling with the ability to create a vast range of living characters, and is often considered the most perfect English novelist.

Austin, 1st Baron, K.B.E. (1866–1941), was the well-known English motor manufacturer. He was the pioneer of the small car—the 7-horse-power car—which he put on the market in 1921.

Avenzoar (Ibn Zuhr) (*c.* 1090–1162), a Moslem physician, born in Seville, the greatest of his time. His chief work was the *Tasir*.

Averroës (Ibn Rushd) (1126–98), Arab philosopher and medical writer, born in Córdova, last and most famous thinker of Moslem Spain. He studied philosophy, theology, mathematics, medicine, and jurisprudence. His greatest works are his commentaries on Aristotle. He was a friend of Avenzoar.

Ayrton, William Edward, F.R.S. (1847–1908), English electrical engineer, inventor of a number of electrical measuring instruments. His first wife, **Matilda Chaplin Ayrton** (1846–83), was one of the first woman doctors and his second wife, **Hertha Ayrton** (1854–1923), became known for her scientific work on the electric arc and sand ripples and for her work for woman suffrage.

B

Baber or Babar (Zahir ud-din-Mahomet) (1483–1530), founder of the Mogul dynasty which ruled Northern India for three centuries, and a descendant of Tamerlane.

Bach, Johann Sebastian (1685–1750). Born at Eisenach, Germany, he became one of the greatest composers in history and has been called the father of modern music. During his appointment as organist at the Thomaskirche, Leipzig, he composed all his great devotional music, including the wonderful *St. Matthew Passion*, *The Passion according to St. John* and the Mass in B Minor. His incessant labour affected his eyes, and in 1749 he became totally blind. His family was connected with music for seven generations, of which his was the fifth.

Bach, Carl Philipp Emanuel (1714–88), third son of Johann Sebastian Bach. He is important in the history of music as founder of the symphony and sonata.

Backhaus, Wilhelm (b. 1884), a German pianist who made early and highly successful appearances as a virtuoso, and first appeared in London in 1901. One of the most gifted of present-day pianists, he became Professor of the Piano at the Royal College of Music, Manchester, 1905.

Bacon, Francis, Lord Verulam, and Viscount St. Albans (1561–1626), was one of the greatest of English philosophers and statesmen, who was Attorney-General to Elizabeth, and under James I. became Lord Chancellor. His political career was tarnished by certain acts of corruption, for which he paid the penalty, but his writings were marked by keen insight, brilliancy of language, and a depth of thought which place them in the first rank of philosophical literature. His *Novum Organum* and his *Essays* are splendid monuments of learning and wisdom.

Bacon, Roger (1214–1294), the Franciscan friar, was a man of remarkable gifts, of great learning and inventive power. In an age of darkness he was the first to insist on the importance of experiment and can claim the title of founder of experimental science. Optics, explosives, engines, mechanical flight came within the range of his researches. The invention of gunpowder has been attributed to him, but without adequate evidence. For a long time he was looked upon as an alchemist and sorcerer, though of late his discoveries have been more truly appreciated.

Baden-Powell, Lt.-Gen. Lord, O.M., G.C.M.G., G.C.V.O., K.C.B. (1857–1941), brilliant cavalry soldier, famous for his defence of Mafeking in the South African War. Founded the organisation of Boy Scouts (1908) and Girl Guides (1910) to promote good citizenship in the rising generation. Chief Scout of the World, 1921–41.

Baer, Karl Ernst von (1792–1876), Estonian biologist, founder of the science of embryology, and discoverer of the mammalian ovum.

Baffin, William (1584–1622), navigator and explorer who in 1616 discovered the bay which separates the north-east coast of British North America from Greenland, which bears his name.

Bagehot, Walter (1826–77), English economist and journalist. Editor of the *Economist*, 1860–77. Wrote three books of lasting importance, *The English Constitution*, 1867, *Physics and Politics*, 1872, and *Lombard Street*, a description of the Money Market, 1873. He was among the first to advocate the creation of Life Peers to strengthen the House of Lords.

Baird, John Logie (1888–1946), Scottish television pioneer; inventor of the televisor and the noctovisor.

Baker, Sir Benjamin, K.C.B., K.C.M.G., F.R.S. (1840–1907), an eminent engineer. He was consulting engineer to the Egyptian Government for the Aswan Dam, joint engineer with Sir John Fowler of the Forth Bridge, and engineer of the Central London Tube Railway.

Baker, Sir Herbert, K.C.I.E., R.A. (1862–1946) was an eminent architect who designed the

Bank of England, Rhodes House, Oxford, and, with the late Sir E. Lutyens, New Delhi.

Bakst, Léon (1868–1924), Russian painter who designed scenery and costumes for the Russian Ballet of Serge Diaghilev.

Balboa, Vasco Nuñez de (1475–1517), Spanish explorer, who was the first European to set eyes upon the Pacific Ocean. As a discoverer he ranks second only to Columbus.

Baldwin of Bewdley, 1st Earl, K.G., P.C. (1867–1947) (as Mr. Stanley Baldwin) was the leading Conservative politician between the two world wars and Prime Minister, 1923–24, 1924–29, and 1935–37.

Balfour, Arthur James, Earl of, K.G., O.M., P.C. (1848–1930), statesman, scholar, and philosopher. Entered Parliament as a Conservative in 1874. Prime Minister, 1902–5. He also served as First Lord of the Admiralty under Asquith and as Foreign Secretary under Lloyd George. His most notable action was issuing the Balfour Declaration on Palestine.

Balliol, John de, English baron whose widow in 1269 founded the college at Oxford which bears his name. Fought for Henry III. against Simon de Montfort. Died in exile in 1269.

Baliol, John (1249–1315), son of the above, competed with Robert Bruce for the Scottish throne, and Edward I. decided in his favour. Only reigned four years, when Edward deposed him, committing him to the Tower, and finally banished him from the country. He retired to Normandy. His son, Edward Baliol, recovered his father's kingdom in 1332, and was upheld by Edward III. whilst very unpopular by reason of his having given up the south of Scotland to the English. He renounced his title and throne in 1356, and retired to England on an annuity.

Ball, John (d. 1381), English priest and a leader of the Peasants' Revolt, after which he was excuted. Author of the couplet *When Adam delved, and Eve span, Who was then the gentleman?*

Balzac, Honoré de (1799–1850), one of the greatest of French novelists, and the author of over eighty novels to which he gave the covering title of *La Comédie Humaine*, depicting the appetites and passions of the new social class born of the revolution and Napoleon.

Bampton, John (1689–1751), an eminent divine, who founded the Oxford Bampton Divinity lectures.

Bancroft, Sir Squire (1841–1926), one of the best-known actor-managers of the later Victorian period. Managed the old Prince of Wales Theatre in London, in conjunction with Marie Wilton (Lady Bancroft), for many years, producing there the popular Robertsonian comedies.

Bandaranaike, Hon. Solomon West Ridgway Dias, B.A. (1899–1959). Prime Minister of Ceylon, 1956–59; leader of the socialist M.E.P. (People's United Front Party). Assassinated Sept., 1959.

Banks, Sir Joseph, Bt., F.R.S. (1743–1820), was president of the Royal Society for upwards of forty years. As a naturalist he was one of the most eminent men of his time, and encouraged science in every form. When Captain Cook made his voyage to the South Seas in 1768, Sir Joseph accompanied him for the purpose of observing the transit of Venus. He left very valuable botanical collections to the British Museum.

Bannister, Dr. Roger Gilbert, C.B.E. (b. 1929), British athlete who set up a new world and British record for the mile at Oxford on May 6, 1954, in 3 min. 59·4 sec., the first mile ever run in under 4 min.

Banting, Sir Frederick Grant, K.B.E., M.C., D.Sc., M.D., F.R.S. (1891–1941). Canadian physician and discoverer of insulin. Prof. of Medical Research, Toronto University, 1923–41.

Bantock, Sir Granville, Mus. Doc.(1868–1946), Professor of Music at Birmingham University 1908–34; Chairman of Trinity Coll. of Music, London. He wrote songs, orchestral music, and much choral music.

Barbirolli, Sir John, F.R.A.M. (b. 1899), Conductor of the Hallé Orchestra since 1943. Relinquished post as permanent conductor in Sept. 1958, to become principal conductor. Succeeded Toscanini as conductor of the New York Philharmonic Symphony Orchestra, 1937–42.

Barbarossa (Red Beard), name given to **Frederick I** (*c.* 1122–90), greatest of the mediæval Holy Roman emperors who struggled (1159–77) to free the Empire from the domination of the Pope. The two brothers who were Barbary pirates also had this name: **Uruj** (*c.* 1482–1518) was killed by the Spaniards, and **Khaireddin** (*c.* 1482–1546) conquered Tunis for the Turks in 1534 and died in Constantinople.

Barbusse, Henri (1874–1935), noted French author and writer of the famous war novel *Le Feu*, which is one of the most remarkable and realistic of all war books, and portrays in a starkly vivid way the experience of the common soldier.

Barker, Dame Lilian, D.B.E. (1874–1955), governor of the Borstal Institution for Girls at Aylesbury, 1923–35; Ass. Comm. of Prisons, 1936–43.

Barnado, Dr. Thomas John (1845–1905), the founder of the well-known homes for orphan-waifs, for some forty years devoted himself to the protection, education and advancement of destitute children.

Barnum, Phineas Taylor (1810–1891), America's most famous showman, originator of Barnum and Bailey's "Greatest Show on Earth."

Barrie, Sir James Matthew, Bt, O.M. (1860–1937), popular Scottish author and playwright. Among his novels are *A Window in Thrums* and *The Little Minister*, while his plays include *Quality Street*, *The Admirable Crichton*, *Dear Brutus*, *Mary Rose*, *Shall We join the Ladies?* and the children's classic, *Peter Pan*. His work is clever and entertaining and is tinged with mysticism.

Barrow, Isaac (1630–1677), a famous divine, mathematician, Greek scholar, and tutor of Sir Isaac Newton. His "Sermons" are amongst the finest in the language.

Barry, Sir Charles, R.A. (1795–1860), architect of the Houses of Parliament at Westminster which took twenty years to build. Knighted in 1852, and buried in Westminster Abbey. His son:

Barry, Sir John Wolfe Wolfe-, K.C.B., F.R.S. (1836–1918), an eminent engineer, designed and carried out some of the most prominent undertakings of the time, including Barry Dock and Tower Bridge.

Bartok, Bela (1881–1945), Hungarian composer and musician. Early compositions influenced by Brahms and Liszt. From an early age deeply interested in folk-song which inspired him in his researches into Hungarian and Rumanian peasant music. His compositions include string quartets, violin sonatas, concertos, orchestral music, a ballet and an opera, and a collection of over 7,000 melodies. Professor at Budapest Conservatory, 1907–12, when he retired into private life as a result of the opposition his compositions aroused.

Bartolommeo, Fra (1469–1517), the distinguished Florentine painter and friend of Savonarola, at whose death he became a monk.

Bartolozzi, Francesco, R.A. (*c.* 1728–1815), a Florentine engraver who came to England in 1764, and for many years was engaged upon engravings, of which he produced an enormous number, many of them of great artistic merit and highly valued by collectors to-day.

Baruch, Bernard Mannes (b. 1870). American economist. Assisted U.S. Government in both world wars, and in 1946 was chairman of the United Nations Atomic Energy Commission.

Bashkirtseff, Marie (1860–84), Russian painter and writer of a famous autobiographical diary.

Bates, Herbert Ernest (b. 1905), novelist and short-story writer. Author of *Fair Stood the Wind for France*, *The Bride Comes to Evensford*, *The Purple Plain*, and *Jacaranda Tree*.

Batten, Jean Gardner, C.B.E. (b. 1909); the famous New Zealand airwoman who made aviation history by her record solo flight from England to Australia in 1934.

Baudelaire, Charles Pierre (1821–67), French poet of startling originality and great sensitivity, he is best known for his book of verse *Les Fleurs du Mal*. He was also a brilliant critic, and his influence is still felt. He was inordinately attached to his mother and allowed his life to be ruined by poverty, despair, and ill-health.

Bax, Sir Arnold Edward Trevor, K.C.V.O., F.R.C.M., F.R.A.M. (1883–1953), Master of the King's Musick, 1942–52; Master of the Queen's Musick, 1952–53. His work includes numerous piano compositions, songs, and chamber works.

Baxter, Richard (1615–91), a great Nonconformist divine, remarkable for the ability and boldness of his writings. His *Saint's Everlasting Rest* is a masterpiece.

Bayard, Pierre du Terrail, Chevalier de (1475–1524), a French knight of exemplary conduct and remarkable for his chivalry. Fell at the Battle of Sesia, and was named "Le Chevalier sans peur et sans reproche."

Baylis, Lilian Mary, C.H. (d. 1937), manager of the Old Vic theatre from 1898 and of Sadler's Wells from 1931. Did great work for the British stage.

Beaconsfield, Benjamin Disraeli, Earl of, K.G., P.C. (1804–81). Son of Isaac D'Israeli (*q.v.*). Statesman and novelist; with Burke (*q.v.*) exercised most influence on Conservative political theories. His first novel, *Vivien Grey*, published when he was only twenty-one, was a brilliant success and the author was able to enter Society. *Coningsby* and *Sibyl*, published twenty years later, helped to rouse the social conscience to the evils of industrial life and of the deplorable relations existing between rich and poor (the "two nations"). Disraeli entered Parliament in 1837, but had only short periods of office before his terms as Prime Minister in 1868 and 1874–80. The second period was marked by the purchase of the Suez Canal shares, by the conferment on the Queen of the title, Empress of India, and by a diplomatic triumph at the Congress of Berlin, abroad, and by a continuation of measures for social reform, at home. He was a gifted orator, the rival and antithesis of Gladstone and the friend of Queen Victoria, who favoured his policies, honoured his wife, and called him "Dizzy."

Beardsley, Aubrey Vincent (1872–98), black-and-white artist, whose illustrations in the *Yellow Book* aroused much controversy.

Beatty, 1st Earl, Admiral of the Fleet, P.C., G.C.B., O.M., G.C.V.O., D.S.O. (1871–1936). First Sea Lord, 1919–27. From 1912 to 1916 Commander of Battle Cruiser Squadron. From Nov. 1916 to 1919 succeeded Lord Jellicoe as Admiral of the main British Fleet. On Aug. 28, 1914, fought the German fleet in the Heligoland Bight. On May 31, 1916, Lord Beatty with his battle cruisers was engaged in a great sea fight with the Germans off Jutland, for which he was granted £100,000 and an Earldom in 1919.

Beaumont, Francis (1584–1616), and **Fletcher, John** (1579–1625), joint authors of many plays, including *The Maid's Tragedy* and *Philaster*. Beaumont was buried in Westminster Abbey, and Fletcher interred in St. Saviour's, Southwark. Thought by some to be authors of plays attributed to Shakespeare.

Beaverbrook, Lord, P.C. (b. 1879) (William Maxwell Aitken). British newspaper proprietor and politician. A Canadian by birth and a man of tremendous energy and will-power, who rendered great service as Minister of Aircraft Production in the crucial years, 1940–41. His papers have sponsored various political campaigns, notably the Empire Free Trade Movement,and have achieved a very large circulation.

Becket, Thomas A' (1118–1170), Archbishop of Canterbury under Henry II. A powerful and ambitious prelate who boldly supported the authority of the Pope against the dictates of the King, and was assassinated in Canterbury Cathedral December 29th, 1170, being canonised two years later.

Becquerel, Antoine Henri (1852–1908), French physicist who in 1896 discovered radioactivity in uranium. Shared with the Curies the 1903 Nobel Prize in Physics.

Bede, "The Venerable" (673–735), a monk of great influence and ability whose historical works cover a great range and are valuable in the outline they give of the early history of this country

Beecham, Sir Thomas, Bt., C.H. (b. 1879), conductor and impresario. Founded the London Philharmonic Orchestra in 1931; introduced into England the operas of Richard Strauss, Russian operas, and the Diaghilev ballet; championed the music of Delius. Recognised as one of the world's greatest conductors, especially in the interpretation of Mozart and Wagner. Conductor of the Royal Philharmonic Orchestra since 1946. Pub. Frederick Delius biography (1959).

Beecher, Henry Ward (1813–1887), an eminent American preacher and lecturer, whose church at Brooklyn was for many years the most popular in the United States. Brother of Mrs. H. B. Stowe.

Beerbohm, Sir Max (1872–1956), brilliant critic and caricaturist who contributed to the *Saturday Review* during his "twelve years' bondage to dramatic criticism" (1898–1910).

Beethoven, Ludwig van (1770–1827), one of the world's greatest musicians and composers, born at Bonn of a poor but musical family, his father being a tenor singer in the service of the electoral prince at Bonn. As a child he was already remarkable for his playing of the harpsichord and violin and for his power of extemporization. Some of his compositions, sonatas, songs and pianoforte variations were published when he was only 13. At 17 he visited Vienna and played before Mozart who promptly recognised his genius. When he was about 30 he began to suffer from the worst malady that could possibly have befallen him: he became deaf. He faced his fate with indomitable courage and perhaps more than any other artist continued to develop until he reached the loftiest pinnacle of musical fame. Between the years 1805 and 1808, Beethoven composed some of his greatest works: the oratorio *Mount of Olives*, the opera *Fidelio*, and the *Pastorale* and *Eroica* symphonies besides a number of concertos, sonatas and songs. He composed four overtures to *Fidelio* at different periods: *Leonore No. 2* (1805), *Leonore No. 3* (1806), *Leonore No. 1* (1807) and *Fidelio* (1814). The *Mass in C* was first performed in 1810 and the *Mass in D* was written between the years 1819 and 1822. The symphonies, nine in number, rank as the greatest ever written and the pianoforte sonatas and string quartets are unequalled in beauty. He died at Vienna at the age of 56.

Behring, Emil von (1854–1917), German bacteriologist and father of the science of immunology. Awarded Nobel Prize in 1901.

Behring, Vitus (1680–1741), Danish navigator who entered the Russian service and in 1728 discovered Behring's Strait, afterwards being wrecked on Behring's Island, where he died.

Belisarius (505–565), famous Roman general under Justinian. His defeats of the Goths and Vandals, and of the Persians were great achievements.

Bell, Alexander Graham, LL.D., Ph.D., D.Sc., M.D. (1847–1922), born in Edinburgh, went to America in 1870, became Professor of Physiology in Boston University. In 1876 exhibited an invention which was developed into the telephone. Invented the photophone, and devoted much attention to the education of deaf-mutes.

Bell, Gertrude Margaret Lowthian, C.B.E. (1868–1926), the "uncrowned Queen of Arabia," was a famous traveller in the East, especially in Arabia. Was an authority on Asia Minor and Iran and an associate of "Lawrence of Arabia" during the Great War.

Bellamy, Edward (1850–1898), American journalist and author of *Looking Backward*, a utopian novel in which he foretells of many changes that have since come to pass.

Bellini, Gentile (*c.* 1429–1507), a celebrated Venetian painter, whose "Preaching of St. Mark at Alexandria," in St. Mark's College, Venice, is one of the renowned pictures of the world.

Bellini, Giovanni (*c.* 1430–1516), brother of the last-named, and a more celebrated painter.

Bellini, Vincenzo (1801–35), Italian operatic composer; born in Sicily, the son of an organist. His graceful vocal melodies were much admired by his friend Chopin and he enjoyed successes in Paris and London. His best-known operas are *I Capuleti ed i Montecchi*, *La Sonnambula*, and *Norma*.

Belloc, (Joseph) Hilaire (Pierre) (1870–1953), a writer of great versatility whose works include *The Bad Child's Book of Beasts*, *The Path to Rome*, *Hills and the Sea*, *Cautionary Tales*, and historical studies of Danton, Robespierre and Richelieu.

Belzoni, Giovanni Battista (1778–1823), a renowned explorer of Egypt who settled in England at the beginning of the 19th century. After a precarious existence began to turn his

attention to hydraulic experiments, and went to Egypt with a view to getting the Government to sanction a scheme of his for raising the water of the Nile. He was then attracted to the study of Egyptian antiquities, and engaged in highly successful researches.

Benedict, St. (480–544), built twelve monasteries, and founded the Order of the Benedictine Monks, at Monte Cassino, near Naples.

Benes, Dr. Eduard (1884–1948), Czechoslovak statesman; co-founder with Thomas Masaryk of the Czech Republic; Foreign Minister, 1918–35, and President 1935–38 and 1940–48. An all-party ministry was overthrown by a communist *coup d'état* in February 1948, and Benes, in failing health, resigned the Presidency in June, dying in September.

Benavente y Martinez, Jacinto (1866–1954), one of the greatest of Spanish dramatists. Author of *Los Intereses Creados* and other famous plays. Nobel Prizewinner, 1922.

Ben-Gurion, David (b. 1886), Zionist leader. Educated at Istanbul University. Helped to organise the Jewish Legion in 1918, and was prominently connected with the Labour movement in Palestine in between the world wars. Prime Minister of Israel since 1948.

Bennett, Enoch Arnold (1867–1931), author and journalist. His stories of the Pottery Towns, where he was brought up, are of high merit. *The Old Wives' Tales*, *Clayhanger*, and *Hilda Lessways* are among his most successful novels. He also wrote plays, including *Milestones*, *The Great Adventure*, and *Mr. Prohack*.

Bennett, James Gordon (1841–1918), proprietor of the *New York Herald*, and a famous yachtsman and motorist. He sent out Stanley on the expedition which resulted in the finding of Livingstone.

Bennett, Sir William Sterndalo (1816–1875), an English composer of eminence, who did much for the advancement of musical art in this country. Schumann pronounced him to be "a thorough Englishman, a glorious artist, and a beautiful and poetic soul." The work of his that is best known is the oratorio *The Woman of Samaria*.

Bentham, Jeremy (1748–1832), the founder of the school of political philosophy, the tenets of which were extended by John Stuart Mill. His works on *Government*, *Usury*, and *The Principles of Morals and Politics*, expound the Utilitarian system with great lucidity.

Bentley, Richard (1662–1742), an eminent classical scholar and critic, for long Master of Trinity College, Cambridge. He was a formidable controversialist and did pioneer work in textual criticism.

Benz, Karl (1884–1929), German engineer whose motor car produced in 1885 was one of the first to be driven by an internal-combustion engine.

Béranger, Jean Pierre de (1780–1857), was the most popular song-writer that France has produced. His songs were often written to serve some passing political purpose, and were invariably in harmony with popular sentiment.

Beresford, William Carr Beresford, Viscount (1768–1854), British General. Participated in capture of Cape Colony and of Buenos Aires. Reorganised Portuguese Army. Master-General of Ordnance in Wellington administration.

Berg, Alban (1885–1935), Austrian composer whose best known work is the three-act opera *Wozzeck*, based upon a drama by Büchner (*q.v.*), which has become a modern classic.

Bergson, Henri Louis (1859–1941), French philosopher, exponent of the theory of vitalism and the life force. Member of French Academy, 1941; Nobel Prize for Literature, 1927. Author of *Matter and Memory* (1896) and *Creative Evolution* (1907).

Bériot, Charles Auguste de (1802–70), Belgian violinist, whose first wife was the great operatic contralto Malibran. His son **Charles Wilfrid de Bériot** (1833–1914) was a fine pianist and the teacher of Ravel.

Berkeley, George, D.D., Bishop of Cloyne (1685–1753), the propounder of the philosophy that the only things that are real are our ideas of what is presented to our senses. In support of this philosophy he wrote several works of great ingenuity of argument, chief amongst them being his *Alciphron, or the Minute Philosopher.*

Berlin, Irving (b. 1888), American composer of popular songs, and the pioneer of both ragtime and jazz music; his songs including *Alexander's Rag-time Band*, *Always*, *What'll I Do?* were the beginning of popular jazz.

Berlioz, (Louis) Hector (1803–69), composer, born in S.E. France, the son of a country doctor; eccentric, highly-endowed, he was the greatest figure in the French romantic movement. His outstanding dramatic works are *La Damnation de Faust* and the *Roméo et Juliette* symphony. His first wife was an Irish actress, Harriet Smithson, for whom he formed a romantic attachment while she was appearing in Shakespearean parts in Rome.

Bernadotte, Count Folke (1895–1948), nephew of the late King Gustav of Sweden. As head of the Swedish Red Cross arranged for the exchange of prisoners in the second world war. In April 1945, he was the intermediary through whom Himmler attempted to capitulate. Appointed United Nations mediator for Palestine in 1947 and brought about a truce between the Arabs and Jews, but was assassinated by Jewish terrorists.

Bernadotte, Jean Baptiste (1764–1844), was a French commander of great distinction who served under Napoleon, and in 1810 was chosen heir to the throne of Sweden. In 1818 he succeeded as Charles XIV., and was a capable ruler.

Bernal, John Desmond, M.A., F.R.S. (b. 1901), Professor of Physics, Birkbeck College, since 1938. Author of *The Social Function of Science*, *Science in History*, *World Without War*, and of many other works on scientific and social subjects, notably crystallography, poison gases, and post-war housing.

Bernard of Menthon (923–1008), patron saint of mountaineers. Founded the alpine hospices of Saint Bernard on the famous Great Saint Bernard Pass between Switzerland and Italy.

Bernard, Saint, of Clairvaux (*c.* 1090–1153), famous French abbot of the monastery of Clairvaux whose sermons and letters had very great influence in Western Europe.

Bernhardt, Sarah (1845–1923), the most renowned tragedienne of her time. Became a member of the Comédie Française after the Siege of Paris, and thereafter occupied a specially prominent position as an actress. Her first performance in London was in 1879. Among her most conspicuous successes are *Théodora*, *Fédora*, and *La Tosca*, while she also appeared as Hamlet with distinction.

Berthelot, Marcellin Pierre Eugène (1827–1907), French chemist and politician, and the first to produce organic compounds synthetically.

Berzelius, Jöns Jakob (1779–1848), Swedish chemist, whose researches laid the foundations for modern chemical science. He devised the system of chemical symbols in use today and discovered several elements.

Bessemer, Sir Henry, F.R.S. (1813–1898), famous for his invention of the well-known process of converting cast-iron direct into steel. His invention entirely revolutionised steel manufacture, greatly reducing the cost of production and making it possible to utilise steel in many directions where previously iron only had been used.

Bevan, Rt. Hon. Aneurin, M.P. (b. 1897), Minister of Health 1945–51 and responsible for introducing the National Health Service which came into operation in 1948; Minister of Labour, Jan.–Apr. 1951. Married to a fellow Socialist M.P., Miss Jennie Lee.

Beveridge, Lord, K.C.B. (b. 1879), British economist. Director of the London School of Economics, 1919–37, and Master of University College, Oxford, 1937–44. Drew up the Beveridge Plan, published in 1942, which formed the basis of the present Health and Insurance Schemes.

Bevin, Rt. Hon. Ernest, M.P. (1881–1951), Secy. of State for Foreign Affairs 1945–51; Minister of Labour and National Service, 1940–45. A British Trade Union Leader who became prominently associated with the Dockers Union, of which he was Assistant General Secretary and of the Transport and General Workers Union of which he was still General Secretary when he entered the Coalition Government as Minister of Labour. He was Chairman of the General Council of Trades Union Congress, 1937.

Bichat, Marie François Xavier (1771–1802), French physiologist who founded the study of general anatomy, on which he wrote several important works. In one of these he showed the important connexion between the brain, heart and lungs.

Biddle, John (1615–62), the first English Unitarian. He was fined, imprisoned and banished for his publications attacking the Holy Trinity. Under a general Act of Oblivion in 1652 he resumed his teachings, which led to further imprisonment, and as a result he died of fever.

Binyon, (Robert) Laurence, C.H. (1869–1943), a poet, art critic and Orientalist; Assistant Keeper of Dept. of Prints and Drawings, British Museum, 1909–13; Deputy Keeper in charge of Sub. Dept. of Oriental Prints and Drawings, 1913–32; Keeper of Prints and Drawings, 1932–33.

Birch, (Samuel John) Lamorna, R.A. (1869–1955), English landscape painter in oils and water-colours, well known for his charming Cornish landscapes and sea studies. His pictures are hung in all the principal galleries of England.

Bird, Cyril Kenneth, C.B.E., B.Sc. (*nom de plume* Fougasse) (b. 1887), humorous artist who edited *Punch* from 1948 to 1952. His witty drawings, many under the title *The Changing Face of Britain*, enlivened the pages of *Punch* for many years and the "Careless Talk Costs Lives" series of the second world war were his creation.

Birkbeck, George (1776–1841), physician, philanthropist, and philosopher. A Yorkshireman who settled in London in 1804, and became the chief founder of Mechanics' Institutes.

Birkenhead, 1st Earl of, P.C., G.C.S.I. (1872–1930), Sec. for India, 1924–1928. Lord Chancellor, 1919–1922, Attorney-General 1915 to 1919. M.P. for the Walton Divn. of Liverpool from 1906 to 1918, and West Derby Divn. thereof from Dec. 1918 to Jan. 1, 1919.

Birkett, 1st Baron (William) Norman, Q.C. (b. 1883), one of the ablest and most prominent members of the English Bar. Lord Justice of Appeal, 1950–7; Judge King's Bench Div. 1941–50; British Mem. (Deputy) Int. Mil. Tribunal at Nuremberg 1945–46; M.P. (L.) for East Nottingham, 1923–24 and 1929–31.

Bishop, Sir Henry Rowley (1786–1855), composer of many popular ballad operas and songs. *Maid Marian*, *Guy Mannering* and *The Miller and his Men*, are his best-known operas. He was also a very successful glee-writer, and was the composer of *Home, Sweet Home*. Was the first musician to be knighted in 1842.

Bishop, Air Marshal William Avery, V.C., C.B., D.S.O., M.C., D.F.C. (b. 1894), Canada's greatest airman. Officially credited with the destruction of seventy-two enemy aircraft in the first world war.

Bismarck, Prince Otto Eduard Leopold von (1815–1898), the most prominent and capable of the German statesmen of the 19th century, entered the diplomatic service in 1851, and filled positions in succession at Vienna, Petrograd, and Paris. In 1862 he was appointed Minister of Foreign Affairs, from which time dates the strong Bismarckian policy which was destined to achieve so much for Prussia. As Imperial Chancellor he may be said to have directed the destinies of his country down to the death of the Emperor William in 1888, when Emperor William II. began to assume a direct control, which Bismarck resented, and in 1890 the "old pilot" was dropped, to use a figure of speech made memorable by one of Tenniel's cartoons. Bismarck retired to his country estates, and did not again interfere seriously in political affairs. Made Count in 1865 and Prince in 1871. Germany has over two hundred monuments to him. He presided at the famous Berlin Conference of 1878. His son, Count Herbert von Bismarck (1849–1904), was appointed German Foreign Minister in 1885, but like his father before him, did not get on well with William II.

Bizet, Georges (1838–75), properly Alexandre César Léopold, French composer who gave the operatic stage several operas full of charming melody and whose immortal *Carmen* from the story by Mérimée was his greatest achievement. He also wrote some orchestral works, piano music, and songs. He died too young to enjoy popularity.

Björnson, Björnstjerne (1832–1910), the Norwegian poet, dramatist, and novelist is one of the great names in modern European literature, his poems, plays, and stories being marked by a strong intellectuality and a rich imagination.

Black, Joseph (1728–99), Scottish chemist. Prof. of anatomy at Glasgow (1756–60) and of medicine and chemistry at Edinburgh (1760). Specially known for discoveries of carbon dioxide (he called it "fixed air") and latent heat. His original work earned him the title father of quantitative chemistry.

Blackett, Patrick Maynard Stuart, F.R.S., M.A. (b. 1897), Professor of Physics, Imperial College of Science and Technology, 1953; Manchester University, 1937–52. Author of *The Military and Political Consequences of Atomic Structure* (1948), *Atomic Weapons and East–West Relations* (1956). Awarded Physics Nobel Prize 1948 for his work in developing the Wilson cloud chamber method of tracing tracks of swift atomic particles. President of the British Association, 1957.

Blackmore, Richard Doddridge (1825–1900), a novelist who in 1869 made a great reputation with his romantic story of *Lorna Doone*.

Blackstone, Sir William (1723–1780), was a Justice of the Court of Common Pleas. His great work, *Commentaries on the Laws of England*, became one of the British classics.

Blackwood, Algernon, C.B.E. (1869–1951), British author. As a young man, farmed in Canada and worked on New York newspapers. Then, from 1906, produced a steady flow of books, plays, and short stories of high quality.

Blair, Robert (1699–1746), a noted Scottish poet, whose poem, *The Grave*, entitles him to a place in all collections of British poetry.

Blake, Robert (1599–1657), Parliamentary general and an admiral in the Cromwellian navy in the Dutch and Spanish wars.

Blake, William (1757–1827), painter, poet, and mystic, whose *Songs of Innocence* and scriptural drawings reveal an intense spirituality. He was a highly independent and original thinker and has been called "the great teacher of the modern western world."

Bland-Sutton, Sir John, Bt., M.D. (1855–1936), an eminent surgeon, whose association with the Middlesex Hospital is commemorated by the Bland-Sutton Institute of Pathology.

Blasco-Ibáñez, Vicente (1867–1928), a Spanish man of letters who wrote *The Four Horsemen of the Apocalypse* and other novels which made him world-famous.

Blériot, Louis (1872–1936), French airman; the first to fly the English Channel from Calais to Dover, July 25, 1909.

Blind, Karl (1826–1907), was a native of Mannheim, and in 1847 associated himself with the German revolutionary movement, but was arrested and imprisoned. Gaining his liberty, he resided in Brussels for a time, and afterwards settled in London, remaining in close touch with men like Mazzini and Louis Blanc, and by pen and speech constantly advocating political freedom.

Bliss, Sir Arthur (b. 1891), English composer, succeeded Sir Arnold Bax as Master of the Queen's Musick in 1953. His best known works are the *Colour Symphony* (1922), *Morning Heroes* (1930) and his ballet *Checkmate* (1937). Mus. Dir. B.B.C., 1941–44.

Bloch, Ernest (1880–1959), composer, whose music is characterised by its Jewish and oriental themes. He was born in Geneva, Switzerland, and became a naturalised American citizen.

Blomfield, Sir Reginald, R.A., M.A., F.S.A. (1856–1942); was a prominent architect, designer of gardens and country houses.

Blondin, Charles (Jean François Gravelet) (1824–1897), a famous French rope performer, who crossed Niagara Falls on a tight-rope.

Blücher, Field-Marshal Gebhard Leberecht von (1742–1819), was the famous Prussian commander who, after a long and brilliant military career, joined forces with Wellington in the final campaign against Napoleon, and materially helped to win the great victory of Waterloo by advancing to Wellington's support.

Blum, Léon (1872–1950), statesman and architect of French socialism. Led a "popular front" government in 1936 and a "caretaker" govern-

ment for a brief period 1946–47. Served as vice-premier 1937–38. During 1940–45 was interned in Germany.

Blunden, Edmund Charles (b. 1896), English poet who was Prof. of Literature at Tokyo University 1924–27. Gained the Hawthornden Prize in 1922 for his poem, *Shepherd*. Fellow and Tutor in English Literature, Merton College, Oxford, 1931–43. Prof. of Literature Hong Kong University, 1954– .

Blunt, Wilfrid Scawen (1840–1922), best known for the part he took in Egyptian affairs in 1881–1882 and his continued support of what is called the Egyptian national movement. He was a devoted admirer of Arabi Pasha, and spent much money in his defence. In 1907 he published his *Secret History of the English Occupation of Egypt*, which aroused much controversy. He married a granddaughter of Lord Byron.

Boadicea, queen of the Iceni tribe of Britons, who raised an army against and defeated the Roman invaders, but was afterwards vanquished by Suetonius and committed suicide in 62.

Boccaccio, Giovanni (1313–1375), an Italian author who has often been called the father of the novel. He had a lively imagination and a graceful style, and his famous *Decameron*—condemned by two Popes and by the Council of Trent—has been a fount of inspiration to poets and story-tellers from Shakespeare to Keats.

Boccherini, Luigi (1743–1805), Italian composer, contemporary of Haydn, who first gained fame as a 'cellist. Settled in Madrid in 1769 as composer to the Chapel of the Infante, which position he held until 1785. Was appointed composer to the Court of Frederick William II. of Prussia, but returned to Spain in 1797, and died in poverty in Madrid.

Bode, Johann Elert (1747–1826), German astronomer remembered mainly for his law (known as Bode's Law) for the calculation of the relative distances of the planets from the sun.

Boehm, Sir Joseph Edgar, Bt., R.A. (1834–90), British sculptor. Executed several famous monuments and statues including that of Carlyle on the Chelsea Embankment, the monument to Dean Stanley in Westminster Abbey, Darwin in the Natural History Museum, Kensington, and the equestrian statue of the Duke of Wellington at Hyde Park Corner.

Bohr, Niels Henrik David (b. 1885), famous Danish physicist who has received universal recognition and fame by his experiments in atomic structure. With Lord Rutherford applied the quantum theory to the study of atomic processes. Awarded Nobel Prize for Physics, 1922.

Boieldieu, François Adrien (1775–1834), French composer whose masterpiece, *La Dame Blanche*, was published in 1825. Composed many works in collaboration with Cherubini and Mehul. Succeeded Mehul as Professor of Composition at the Conservatoire, Paris, in 1817.

Boileau-Despréaux, Nicolas (1636–1711), literary critic and French poet who was contemporary with Molière, Racine, and La Fontaine. He wrote many classical imitations and is famous for his *Satires*.

Boito, Arrigo (1842–1918), Italian poet and composer. He wrote the libretti of *Otello* and *Falstaff* for Verdi, and for his own operas of *Mefistofele* and many others.

Boleyn, Anne (1507–36), queen of Henry VIII and mother of Queen Elizabeth. Originally maid-in-waiting to Catharine of Aragon and her successor when Catharine's marriage was annulled. She failed to produce a male heir and was beheaded on a charge of adultery.

Bolivar, Simón (1783–1830), the first President of Venezuela and subsequently Dictator of Peru; commonly called the Washington of South America.

Bonaventura, St. (1221–1274), a Franciscan monk of great learning and piety, and a leading Schoolman. He was called "the Seraphic Doctor."

Bondfield, Rt. Hon. Margaret Grace, C.H. (1873–1953), Min. of Labour, 1929–31. Represented Northampton, 1923–24. Wallsend, 1926–31. First woman member of a British Cabinet.

Bone, Sir Muirhead (1876–1953), Scottish artist, famous for his drawings and etchings of architectural subjects. Excelled in dry-point and drawings of intricate scaffolding. His son **Stephen Bone**, painter and critic, died in 1958 at the age of 53.

Bonheur, Rosa (1822–1899), a native of Bordeaux, and one of the most noted animal painters of the 19th century.

Boniface, St. (*c.* 675–754), a Benedictine monk, native of Devon, original name Wynfrith. Sent by Pope Gregory II. on missionary work in Germany; appointed archbishop of Mainz, 746. Attacked and killed with over 50 companions by pagans in Friesland.

Booth, Edwin (1833–93), American Shakespearean actor, son of Junius Brutus Booth, the English tragedian, and brother of John Wilkes Booth, who assassinated President Lincoln.

Booth, William (1829–1912), founder and first general of the Salvation Army, b. Nottingham. He entered the Methodist New Connexion and was from the first interested in evangelical work. In 1865, with the help of his wife, Catherine Booth, he began mission work in the East End of London which led to the creation in 1878 of the Salvation Army on military lines. His zeal and organising ability developed it into a great religious military organisation with branches in many parts of the world. His son Bramwell (*d.* 1925) and his daughter Evangeline were among his successors.

Borgia, Cæsar (1476–1507), the masterful and unscrupulous son of Pope Alexander VI., who paved his way to power by the murder of those who stood in his way, and aided by Louis XII. of France, became ruler of Romagna, the Marches, and Umbria. Pope Julius II. banished him from Rome, and he was imprisoned in Spain, but escaped to find a soldier's death in the Army of Navarre in the invasion of Castile.

Borodin, Alexander Porfyrievich (1834–87), Russian composer who was a professor of chemistry and founded a school of medicine for women. In a busy professional life he wrote two symphonies, three string quartets, the symphonic sketch *In the Steppes of Central Asia*, some beautiful songs, piano music, and the immortal opera *Prince Igor*, left unfinished at his death but completed by his friends Rimsky-Korsakov and Glazunov.

Borotra, Jean (b. 1898), famous French lawn tennis champion, known as "the bounding Basque." A popular figure at the Wimbledon championships before and after the second world war.

Borrow, George Henry (1803–81), English author, for many years agent for the British and Foreign Bible Society; in the course of his wanderings studied gypsy life and wrote of his experiences in *Lavengro*, *Romany Rye*, *Bible in Spain*.

Bose, Subhas Chandra (1897–1945), Indian nationalist leader; killed in aeroplane crash.

Boswell, James (1740–1795), made himself famous by writing *The Life of Dr. Johnson*, spending some years in close intimacy with the great lexicographer, and producing what is probably the finest biography in the language. His own journals and letters, collected together by Yale University and published in 1949 as *The Boswell Papers*, are among the greatest literary collections ever assembled.

Botha, General the Rt. Hon. Louis (1862–1919), the Boer general who succeeded Joubert in command of the Transvaal forces in the Boer War 1899–1902. On parliamentary government being granted to the Transvaal in 1907 he became the first Prime Minister, and attended the Imperial Conference in England the same year. In 1910 made first Premier of the South African Union. After the outbreak of war with Germany took the field at the head of a Union force and, in addition to putting down a rebel movement engineered by Germany, conquered a large portion of German African Territory.

Bottesini, Giovanni (1821–89), Italian double-bass player, also famous as an opera conductor and composer.

Botticelli, Sandro (*c.* 1444–1510), Italian painter and disciple of Savonarola, the democrat. Produced many notable pictures, and assisted in the decoration of the Sistine Chapel. His illustrations to Dante's *Divine Comedy* are world-famous.

Bottomley, Horatio (1860–1933), politician, journalist, financier, and for many years one of the most notorious characters in England

A brilliant speaker, he was twice M.P. for South Hackney. Altogether 260 petitions in bankruptcy were presented against him, mostly without effect; he was constantly in the law courts, defending himself with skilful audacity against famous K.C.s. Millions of pounds passed through his hands, much of it obtained from small investors, but he died in poverty after serving seven years' penal servitude for fraud.

Boughton, Rutland (b. 1878), English composer who has also written on the history and philosophy of music. His opera *The Immortal Hour* has enjoyed great success.

Boult, Sir Adrian C., Kt., M.A., D.Mus., F.R.C.M. (b. 1889). Chief conductor London Philharmonic Orchestra, 1950–57, which he took to Russia in 1956. Conductor of the B.B.C. Symphony Orchestra, 1930–50, and Musical Director B.B.C., 1930–42.

Bowdler, Thomas (1754–1825), a pious English physician, who issued expurgated editions of Shakespeare and Gibbon, eliminating all expressions offensive to good taste. Hence the term "bowdlerise."

Boyce, William (1710–79), famous London organist, composer of church music, songs and cantatas, and master of the orchestra of George III.

Boyd Orr, John, 1st Baron, F.R.S., M.D., D.Sc. (b. 1880), Scientist, farmer and nutritional expert. Prof. of Agriculture, Aberdeen University, 1942–45; Director-General, World Food and Agricultural Organisation, 1945–48, now Chancellor of Glasgow University. Awarded Nobel Peace Prize, 1949.

Boyle, Hon. Robert, F.R.S. (1627–1691), English scientist who with Robert Hooke laid the foundations of the modern sciences of chemistry and physics. He established "Boyle's law," which states that the volume of a gas varies *inversely* as the pressure upon it, provided temperature be constant.

Bradley, General of the Army Omar N. (b. 1893), distinguished American soldier who was appointed chairman of the Joint Chiefs of Staff in succession to Gen. Eisenhower in 1949. Commanded 2nd U.S. Army Corps in Tunis and Sicily, the American Assault Forces in Normandy in 1944, and later the 12th U.S. Army Group. Retired 1953.

Bradman, Sir Donald George (b. 1908), Australian cricketer and one of the world's best batsmen. Captained Australia in Test matches against England, 1936–48.

Bragg, Sir Wm. (Henry), O.M., K.B.E., F.R.S., M.A., D.Sc. (1862–1942), was a brilliant scientist. Nobel Physics Prize, 1915. Was Director of the Royal Institution of Great Britain; Fullerian Prof. of Chemistry, Royal Institution, and Director of Davy-Faraday Research Laboratory, 1923–42; President of British Association, 1928. President of the Royal Society, 1936–40.

Bragg, Sir (William) Lawrence, O.B.E., M.C., F.R.S. (b. 1890), succeeded Lord Rutherford as Cavendish Prof. of Experimental Physics, Cambridge Univ., 1938–53. Dir. Royal Institution, 1954– . Shared with his father (Sir Wm. H. Bragg) the 1915 Nobel Prize for research work on X-rays and crystal structures.

Brahe, Tycho (1546–1601), a celebrated Danish astronomer, and fellow-worker of Kepler. With large sums of money put at his disposal by Frederick II. of Denmark, he built an observatory called Uraniborg on the island of Hveen, near Copenhagen, where for over 20 years he carried out a vast programme of accurate and systematic observations of the heavenly bodies and compiled tables of their motions.

Brahms, Johannes (1833–97), composer, regarded as outstanding figure of German classic-romantic school; born in Hamburg, the son of a double-bass player. His compositions are classical in form yet possess deep intensity of expression and poetic significance. He composed four symphonies which rank amongst the greatest ever written, two piano concertos, a violin concerto, a double concerto for violin and 'cello, much fine chamber music, numerous songs of great lyrical beauty, and choral work, notable among which is his *German Requiem*. Lifelong friend of the Schumanns. His life was devoted to music; he never married.

Braille, Louis (1809–52), French educationist, who, as teacher of the blind, perfected his system of reading and writing for the blind. As the result of an accident when he was three years old he was himself blind.

Bramah, Joseph (1749–1814), a Yorkshireman who devoted himself to invention, introduced numerous mechanical improvements, including the hydrostatic press, a liquid-pumping apparatus, a most ingenious series of safety locks, and bank-note printing machines.

Brampton, Lord, P.C. (1817–1907), long known to the public as Sir Henry Hawkins. Was famous as an advocate, and took part in many celebrated cases, including the Tichborne trial. His *Reminiscences*, published in 1904, was one of the books of the year.

Brandes, Georg Morris Cohen (1842–1927), Danish literary critic who exerted a vitalising influence on literature and art. He was the author of many fine critical works, notable among which were his published lectures *Main Currents in European Literature of the 19th Century* and his studies *Benjamin Disraeli, William Shakespeare, Goethe, Voltaire, Julius Cæsar*, and *Michelangelo*.

Brangwyn, Sir Frank, R.A., R.P.E. (1867–1956), artist of Welsh extraction born at Bruges; first worked for William Morris making cartoons for textiles. His first painting, "A Bit of the Esk," was exhibited at the Royal Academy in 1885. He was regarded as the greatest mural artist and etcher of his day and is also noted for his many lithographs.

Brecht, Bertold (1898–1959), German dramatist and poet, whose cynical and satirical works are characteristic of the period between the two world wars. He left Germany in 1933 for Russia and went to the United States in 1941. His plays include *Die Dreigroschenoper* (with music by Kurt Weill).

Brennan, Louis, C.B. (1853–1932), successful inventor, born in Ireland. Paid £120,000 by the British Government for his gyro-directed torpedo; also the inventor of a mono-rail locomotive on the gyroscope principle.

Brewster, Sir David, LL.D., F.R.S. (1781–1868), Scottish physicist and natural philosopher, a great experimenter and prolific writer. Noted for his researches into the polarisation of light. Reputed to be one of the founders of the British Association.

Bridges, Edward, 1st Baron, G.C.B., G.C.V.O., P.C., M.C. (b. 1892), son of Robert Bridges. Permanent Secretary to the Treasury and Head of Civil Service, 1945–56. Secretary to the Cabinet, 1938–46. Fellow of All Souls' College, Oxford, 1954. Chanc. Reading Univ., 1959.

Bridges, Robert, O.M., M.A. (1844–1930), was Poet Laureate 1913–30. Practised medicine up to 1882, thenceforward devoting himself mainly to literature. He published several volumes of poems and plays, displaying refined fancy and a broad philosophic spirit. His *Testament of Beauty* was published in 1930.

Bridgewater, Francis Egerton, 3rd (and last) **Duke of** (1736–1803). The projector of the famous Bridgewater Canal, which was the beginning of the great English canal system, and yielded his family enormous wealth; it was absorbed in 1887 by the Manchester Ship Canal Company, who paid £1,710,000 for it.

Bridgewater, Francis Henry Egerton, 8th (and last) **Earl of,** F.R.S. (1756–1829), grand-nephew of the last-named, and founder of the famous *Bridgewater Treatises*, written by the most celebrated divines and scientists of the day, and devoted to demonstrating the power, wisdom, and goodness of God, as manifested in the Creation.

Bridie, James. (pseudonym of Osborne Henry Mavor), C.B.E., LL.D., M.D. (1888–1951), Scottish author and dramatist. Educated at Glasgow Academy and University. The first of his many successful plays was *The Anatomist*, produced in 1931. Others include *Tobias and the Angel, Jonah and the Whale, Mr. Bolfrey, Dr. Angelus*.

Brieux, Eugène (1858–1932), French dramatist, whose plays are satires on definite evils of society, and deal with such subjects as divorce, legal hypocrisy, social diseases, etc. Was elected a member of the French Academy in 1909.

Bright, Sir Charles Tilstone (1832–88), English telegraph engineer, who after superintending

the laying of telegraph lines in many parts of Great Britain organised the Atlantic Telegraph Company (1856), and as Engineer-in-chief supervised the laying of the first Atlantic Cable (1858).

Bright, Rt. Hon. John (1811—1889), a famous Radical Quaker statesman and orator, one of the chief promoters of the Reform movement which led to the introduction of Free Trade.

Britten, Edward Benjamin, C.H. (b. 1913), composer of a variety of music, including *Spring Symphony, Let's make an Opera, The Rape of Lucrezia, Peter Grimes, Albert Herring, Billy Budd,* and *Gloriana,* composed to mark the occasion of the Coronation.

Broca, Paul (1824–80), French anthropologist, surgeon and pathologist. From 1867 he was Professor of Pathology, Paris. He discovered the seat of speech in what is known as convolution of Broca. He was the founder of modern anthropology and is regarded as the originator of the science of craniology.

Brock, Sir Thomas, K.C.B., R.A. (1847–1922), pupil of Foley, achieved a high reputation as a sculptor. The Queen Victoria Memorial in front of Buckingham Palace is his work.

Brogan, Denis William, M.A. (b. 1900), Prof. of Political Science at Cambridge. An authority on France, America, and Britain, and his works include *The Development of Modern France, Politics and Law in the United States,* and *The English People.*

Broglie, French noble family of Piedmontese origin who settled in France in the 17th cent. **Victor Maurice, comte de Broglie** (1671–1745) was marshal of France and fought in the wars of Louis XIV. **Louis Victor, prince de Broglie** (b. 1892) and **Maurice, duc de Broglie** (b. 1875) the eminent French physicists are his grandsons.

Brontë, Charlotte (1816–1855), one of the most gifted novelists of the 19th century. Her *Jane Eyre,* published in 1847, attracted universal notice, and her other novels, *Shirley, Villette,* and *The Professor,* are all marked by the force of strong genius. Her sisters, **Emily** (1818–48) and **Anne** (1820–49), also wrote novels and poems, Emily's *Wuthering Heights* and some of her verse showing exceptional power.

Brookeborough, Basil Stanlake Brooke, 1st Viscount, C.B.E., M.C. (b. 1888), Prime Minister of Northern Ireland since 1943. An Ulster Unionist.

Brooke, Rupert (1887–1915), a British poet who died during the first world war, whose works, though few, showed great promise and include the poems *Grantchester* and *If I Should Die.*

Brougham, Lord, P.C., F.R.S. (1778–1868), one of the chief legal luminaries of the 19th century, who made a great name by defending Queen Caroline against George IV., and afterwards rose to political eminence.

Brown, Sir Arthur Whitten, K.B.E. (1886–1948), together with Sir John Alcock (d. 1919) in 1919 made the first transatlantic flight, crossing from Newfoundland to Ireland in 16 hr. 12 min.

Brown, John, "of Ossawatomie" (1800–1859), the hero of Harper's Ferry, whose action in inciting certain negro slaves to rebel in 1859 struck the note of alarm which resulted in the Civil War. His attempt to take the Arsenal at Harper's Ferry was defeated, and he was hanged, being afterwards regarded as a martyr by the Abolitionists.

Browne, Charles Farrer (Artemus Ward) (1834–1867), was one of the most whimsical and entertaining humorists America has produced. In addition to his books he wrote and delivered exceedingly funny lectures, and was making an English tour with them when he was seized with a fatal illness, dying at Southampton.

Browne, Hablot Knight (1815–1882), best known as "Phiz," the illustrator of Dickens's novels, from the *Pickwick* period down to *Little Dorrit.*

Browne, Sir Thomas (1605–82), author of *Religio Medici,* was a London physician and antiquary.

Browning, Elizabeth Barrett (1806–1861), an English poetess of eminence who, between 1830 and 1860, wrote many poems showing great intellectual grasp and imaginative fervour. Some of her works, such as *The Cry of the Children, Lady Geraldine's Courtship, The Romaunt of the Page,* and *Bertha in the Lane,* are sure of immortality, and her *Aurora Leigh,* a novel in poetic form, is, in portions, on a high level of poetic execution. She was married to Robert Browning in 1846, and afterwards lived mostly in Italy.

Browning, Robert (1812–1889), one of the two greatest poets of the later Victorian era. His earlier poems and dramas, though marked by singular insight and power, were far from popular, mainly because of a somewhat obscure and involved style from which he only occasionally freed himself. His *Strafford* and *The Blot on the 'Scutcheon* were both produced by Macready, and attained some measure of stage success; but Browning was essentially a poet to be read, rather than acted. Some of his dramatic characterisations are of striking power. From about 1864 he published many works and knew at last what it was to be an appreciated poet. His *Men and Women, Dramatis Personæ,* and *The Ring and The Book,* contain some of the finest poetry of modern times.

Bruce, Robert (1274–1329), took part with Sir William Wallace, (*q.v.*) in the revolt against Edward I., later leading the popular cause. Achieved one victory after another, until at Bannockburn he overthrew the English army and ultimately secured Scottish independence. He reigned twenty-two years as King Robert I.

Bruch, Max (1838–1920), German composer and conductor, best known for his G minor violin concerto.

Bruckner, Anton (1824–96), Austrian composer and organist. He wrote nine symphonies, much religious music, including a *Te Deum* for chorus and orchestra, and one string quartet.

Brummell, George Bryan (1778–1840), "Beau Brummell," the fashion leader in English Society when George IV. was Prince of Wales; was a *bon vivant* and gamester whose excesses involved him in imprisonment and ultimate imbecility.

Brunel, Isambard Kingdom (1806–1859), a prominent engineer who constructed the more difficult portions of the Great Western Railways, and many other important works. He also achieved eminence as a designer of steamships.

Brunel, Sir Mark Isambard (1769—1849), father of the last-named, and constructor of the Thames tunnel, finished in 1843.

Brunelleschi, Filippo (1377–1446), Italian architect, born in Florence, pioneer of Renaissance architecture, adapting the ideals of the Roman or classic period to the conditions of his own day. Many examples of his work are to be seen in Florence—in the Pitti Palace, the Churches of San Lorenzo and San Spirito, the great cupola of the cathedral of Santa Maria del Fiore and the beautiful carved crucifix in the Church of Santa Maria Novella.

Bruno, Giordano (*c.* 1548–1600), Italian philosopher and martyr; entered the Dominican Order at Naples in his 15th year. Accused of heresy he fled from his convent and roamed over Europe. In 1592 he returned to Italy and was arrested by the Inquisition. After 7 years in prison was burned at the stake, Feb. 17, 1600. A statue to him was erected in the Campo dei Fiori, 1889.

Brutus, Marcus Jonius (85–42 B.C.), Roman Governor and one of the founders of Roman civil law.

Bryant, Arthur Wynne Morgan (b. 1899), English historian and pageant producer. Among his works are *English Saga, 1840–1940,* a life of *George V., The Story of England,* and several books on the Napoleonic war years and the Restoration period, including a balanced and informative biography of Pepys.

Buchanan, George (1506–82), Scottish humanist who spent most of his life in France lecturing and writing Latin poems, plays, and treatises. Montaigne, Mary Queen of Scots, and James VI of Scotland were his pupils at various times. He was the best Latin scholar of his age, and his most important works are *De jure regni apud Scotos* and *Rerum Scoticarum historia.*

Buchman, Rev. Frank Nathan David (b. 1878), American evangelist, leader of the movement known as "moral rearmament." Initiated in 1921 the religious fellowship known as the Oxford Group Movement.

Buchner, Eduard (1860–1917), German chemist and professor, famous for his discovery of the enzymes within yeast cells and for his work in the chemistry of fermentation. For this he was awarded the 1907 Nobel Prize for Chemistry.

Büchner, Georg (1813–37), German dramatist

whose career was terminated by his early death at the age of twenty-four, but whose limited output (principally *Dantons Tod* and the fragment *Wozzeck*) is marked by extraordinary power and maturity.

Buckle, Henry Thomas (1821–1862), the author of *The History of Civilisation in England*, one of the most vigorous productions of the 19th century.

Budge, Sir Ernest Alfred Wallis, Litt. D., D. Litt., F.S.A. (1857–1934), a distinguished archæologist who conducted many excavations in Mesopotamia and Egypt. Was Keeper of Egyptian and Assyrian Antiquities at the British Museum, 1893–1924.

Buffon, Georges-Louis Leclerc, Comte de (1707–88), French author and naturalist who devoted his life to the study of natural history and whose great work *Histoire Naturelle* in 36 volumes appeared between 1749 and 1789.

Bulganin, Marshal Nikolai Alexandrovitch (b. 1895), Prime Minister of Soviet Russia, 1955–58. Formerly Soviet Defence Minister.

Bull, John (c. 1562–1628), was organist to James I. and composed much acceptable music, including, it is supposed, our National Anthem *God save the Queen*.

Bülow, Hans Guido von (1830–94), German pianist and conductor, an outstanding figure among the musicians of his day. He married Liszt's daughter Cosima, who later left him to marry Wagner.

Bunsen, Robert Wilhelm (1811–1899), German chemist, discoverer of the metals cæsium and rubidium, and inventor of the Bunsen burner, battery, and pump. Made many important observations in spectrum analysis.

Bunyan, John (1628–1688), was originally a travelling tinker and is believed to have served in the Parliamentary army. He joined an Independent church in Bedford in 1655 and became a popular preacher. After the Restoration he was thrown into prison, and there wrote *Pilgrim's Progress*, the finest allegorical work in this or any language. Of his other works the *Holy War*, *Grace Abounding*, and *Mr. Badman* are the best known.

Burckhardt, Jacob Christoph (1818–97), Swiss historian whose *The Civilisation of the Renaissance in Italy* is one of the great classics on the subject.

Burghley, William Cecil, Lord (1520–1598), Secretary to Lord Protector Somerset, an influential statesman under Edward VI, and Queen Mary, and subsequently Queen Elizabeth's favourite Minister for forty years.

Burke, Edmund (1729–1797), the acknowledged philosopher of conservatism: son of a Dublin attorney, went to London in 1756, and made his mark in literature by his famous work on the *Sublime and Beautiful*. Later on was private secretary to the Marquis of Rockingham, then Premier, and entered Parliament, where he quickly made a name. An able and earnest debater, he took part in all the great movements of his time, and in 1795, after his retirement, was awarded a handsome pension from the Civil List.

Burnet, Bishop Gilbert (1643–1715), wrote a *History of His Own Times*, which deals with many events of which he had personal knowledge, and is a valuable legacy to historical scholars.

Burnet, Sir John James, R.A. (1859–1938), was a leading British architect, whose most important work was the King Edward VII Galleries of the British Museum, opened in May 1914. Among his many large buildings in London are Adelaide House, and the extension to Selfridge's.

Burney, Fanny (*See* **D' Arblay, Madame.**)

Burns, Robert (1759–1796), Scotland's greatest poet. Startled the world with a little book of poems in 1786 which proclaimed him a true són of the muses. With the £500 that his book yielded him he bought a farm, obtained an appointment with the Excise in 1789, and for the last five years of his life lived at Dumfries. In his career he poured forth song after song of emotional tenderness, and made his name immortal.

Burton, Sir Richard Francis, K.C.M.G. (1821–1890) explorer, orientalist, and diplomatist, who became famous after making a pilgrimage to Mecca in 1853 disguised as a Mohammedan. Later he did much exploring in Central Africa, wrote several books and made a remarkable literal translation of the *Arabian Nights* (16 vols.).

Busoni, Ferruccio Benvenuto (1866–1920), the greatest pianist of his age, and composer of 3 operas (the last, *Dr. Faust*, unfinished at his death), much orchestral and chamber music, and works for the piano. He was born in Empoli near Florence but spent much of his life in Germany.

Bustamante, Sir William Alexander (b. 1884), Jamaican labour leader and politician. When Jamaica received its new constitution in 1944 the Labour Party under his leadership gained an overwhelming electoral victory.

Butler, Joseph (1692–1752), an English divine who occupied an important place among eighteenth-century thinkers. He declined the Archbishopric of Canterbury in 1747, but in 1750 became Bishop of Durham. In 1736 he published his *Analogy of Religion*, the whole of which was a reply to the deistic attacks on revealed religion.

Butler, Dr. Nicholas Murray (1862–1947), President of Columbia University, 1902–45. A well-known publicist and internationalist and one of the most honoured and distinguished leaders in the world of education. Shared with Jane Addams (*q.v.*), the noted American sociologist, the Nobel Prize for Peace, 1931.

Butler, Rt. Hon. Richard Austen, C.H., M.P. (b. 1902), Home Sec., 1957– ; Chair. Cons. Party, 1959– ; Leader of the House of Commons, 1955– ; Chan. of the Exchequer, 1951–55; Min. of Education, 1941–45; and responsible for the Education Act, 1944. A member of the distinguished Cambridge family and son of the late Sir Montague Butler, formerly Master of Pembroke. Took leading part in the drawing-up of the various political charters setting out Conservative policy.

Butler, Samuel (1612–1680), renowned as the author of *Hudibras*, one of the wittiest poems in the language and one of the most quoted. His last years were spent in poverty, and he was buried in the churchyard of St. Paul's, Covent Garden, and given a memorial in Westminster Abbey, " that he who was destitute of all things when alive might not want a monument when dead."

Butler, Samuel (1835–1902), author of the satirical novel *Erewhon* and its sequel *Erewhon Revisited*. Other works include *The Fair Haven* (1873), *Life and Habit* (1877), *Evolution Old and New* (1879), in which he attacked Darwinism. *The Way of All Flesh* and his famous *Notebooks* were published posthumously. Butler was a man of great originality and scholarship. He studied painting and exhibited regularly in the Academy and was also a musician.

Butt, Dame Clara, D.B.E. (1873–1936), the famous English contralto, made her first professional appearance in London in 1892. Her success was immediate. She was married to Mr. Kennerly Rumford—also an able vocalist—in 1900.

Buxton, Sir Thomas Fowell, 1st Bart. (1786–1845), a philanthropist and zealous advocate of the abolition of slavery.

Byrd, Rear-Admiral Richard Evelyn (1888–1957), famous American aviator and Polar explorer. Was in command of the Macmillan Arctic Expedition, 1925; flew over the North Pole, 1926; with three companions flew across the Atlantic, 1927, and in 1929 made the first flight over the South Pole. Discovered Edsel Ford mountains and Marie Byrd Land on his first expedition to the Antarctic, 1928–30. He made a second expedition in 1933–5, a third in 1939, and a fourth in December 1946.

Byrd, William (1543–1623), English writer of keyboard music and the greatest musician of the 16th century. He wrote church music, sacred choral music, string music, vocal and instrumental music, and founded the school of English madrigalists. He was organist of Lincoln Cathedral at 20 and later of Queen Elizabeth's Chapel Royal.

Byron, George Gordon, 6th Lord (1788–1824), was the poet who exercised the greatest influence upon European thought during the early part of the 19th century. Educated at Harrow and Cambridge, he published his *Hours of Idleness* at twenty, a volume which was violently attacked by the *Edinburgh Review*

which provoked his retaliatory *English Bards and Scotch Reviewers*, which caused a great sensation because of its unsparing criticisms of the writers of the day. His *Childe Harold's Pilgrimage*, the first two cantos of which were published in 1812, at once placed him in the front rank of poets, and thenceforward to the time of his death he continued to produce poems, most of which were marked by an intense Republican sentiment, yet full of passion and charm and beauty. He made an unhappy marriage in 1815 with the daughter of Sir Ralph Milbanke, from whom he parted after a twelvemonth. He lived abroad for the rest of his life and died at Missolonghi, whither he had proceeded with a view to aiding the Greeks in their battle for national independence.

C

Cable, George Washington (1844–1925), a well-known American author, born in New Orleans, the scene of many of his best works. Among his writings were *Ole Creole Days* (1879), *Strange Stories of Louisiana* (1889), and serious sociological studies such as *The Negro Question* (1890).

Cabot, John (*c.* 1455–*c.* 1498), Genoese explorer who settled in Bristol and sailed westwards under letters-patent from Henry VII of England in 1497. Discovered Newfoundland and Nova Scotia, believing them to be part of Asia, and may have reached the mainland of America before Columbus did. His son:—

Cabot, Sebastian (*c.* 1483–1557) was born in Venice, and in 1509 sailed in search of a north-west passage to Asia. Sailed as far as the entrance of Hudson Bay. Entered Spanish service in 1512, and in 1518 was appointed chief pilot. Spent several years exploring the Plate and Parana rivers. Re-entered English service in 1548 and organised expedition to seek a north-east passage to open up trade with India, which resulted in trade with Russia. English claim to North America is founded on the voyages of the Cabots.

Cabral, Pedro Alvarez (*c.* 1467–*c.* 1520). Portuguese navigator, friend of Vasco da Gama, and discoverer of Brazil, which he named "Terra da Santa Cruz."

Cadbury, George (1839–1922), was a prominent member of the Society of Friends, a well-known Philanthropist, and ardent Liberal, and head of the firm of Cadbury Bros., Bourneville. He took the lead in the Garden City project, and the village of Bourneville may be regarded as the first enterprise of the character to be practically completed; it has an endowment of over £200,000.

Cadogan, Rt. Hon. Sir Alexander, O.M., G.C.M.G., K.C.B. (b. 1884), entered the Diplomatic Service in 1908, and succeeded Lord Vansittart as permanent Under-Secretary of the Foreign Office in 1938. Helped to draft the Charter of the United Nations Organisation, and became Great Britain's first permanent representative on the Security Council. Chairman of the B.B.C., 1952–7.

Caedmon, the first English Christian poet, lived in the seventh century and, according to Bede, was first a cowherd and later a monk at Whitby. His poetry was based on the Scriptures.

Caesar, Caius Julius (*c.* 101–44 B.C.), Roman general. Was appointed successively military tribune, quæstor in 68, ædile in 65, and pontifex maximus in 63. A year later he was prætor, and later formed one of the first triumvirate. He invaded Gaul and Britain, in the Civil War defeated Pompey, and in the Alexandrine war met Cleopatra, and established her firmly on the throne of Egypt. On his return to Rome in 44 the crown was offered to him, a circumstance which caused the aristocratic party to compass his assassination.

Caine, Sir Thomas Henry Hall, C.H., K.B.E. (1853–1931), author of numerous novels, including *The Deemster*, *The Manxman*, *The Christian*, *The Prodigal Son*, *The Woman Thou Gavest Me*, the latter being one of the fiction sensations of 1913.

Calderón de la Barca, Pedro (1600–1681), a Spanish dramatist of great eminence whose plays number nearly 200. He was writer of court spectacles for Philip IV.

Callcott, Sir Augustus Wall, R.A. (1779–1844). Attained great eminence as a landscape painter.

Calvin, John (1509–1564), one of the leading Reformers of the 16th century. Was born in Picardy and attained great popularity as a preacher in Paris, but was expelled, and subsequently lived at Geneva, where he continued to preach the new doctrine, giving it that special shape which resulted in the formation of the Calvinist body, distinguished by its greater austerity from that of the Lutherans.

Camden, William (1551–1623), an antiquary, historian, and master of Westminster School, whose researches, especially in the field of topography, have been of the greatest value. He became Clarencieux King-at-Arms, and was buried in Westminster Abbey. The Camden Society is named after him.

Cameron, Sir David Young, R.A. (1865–1945), was one of the best known of British etchers as well as an excellent landscape-painter. King's Painter and Limner in Scotland, 1933–45.

Cameron, Richard (*c.* 1648–1680), one of the Scottish 17th-century preachers who raised the standard of revolt in defence of the Solemn League and Covenant; he was, after many vicissitudes, slain in combat near Aird's Moss, Ayrshire, in 1680. The members of the Reformed Presbyterian Church were afterwards called Cameronians.

Cameron, Verney Lovett, C.B. (1844–1894), a noted African explorer who was the first to cross the African continent from east to west. Explored Lake Tanganyika, and made many valuable geographical discoveries. In 1872 went out to find Livingstone, and in 1873 met a party of natives bearing the dead body to the coast.

Camillus, Marcus Furius (446–365 B.C.), was five times Dictator of the Roman Republic, a supporter of the patrician order, and one of the most successful of the Roman generals. He died of the pestilence, 365 B.C.

Camm, Sir Sydney, C.B.E. (b. 1893), designer of the Hawker Hurricane Fighter aeroplane.

Cammaerts, Emile, C.B.E. (1878–1953), Belgian poet, critic, historian and dramatist. Born in Brussels, he settled in England in 1908, and became Professor of Belgian Studies and Institutions in the University of London. He became widely known during the war of 1914–18 for a series of Belgian poems.

Camões, Luis Vaz de (1524–1580), the author of *Os Lusiadas*, the great epic poem of Portugal, which sets forth the adventures of the discoverers of India, and celebrates the achievements of the principal personages in Portuguese history.

Campbell, Sir Colin. *See* **Clyde, Baron.**

Campbell, Sir Malcolm (1885–1948), the racing driver who held the land-speed record of 301 m.p.h. (1935) and water-speed record 141·7 m.p.h. (1939). His son **Donald M. Campbell,** C.B.E., broke his own world water-speed record on May 14, 1959, averaging 260·35 m.p.h.

Campbell, Beatrice Stella (Mrs. Patrick Campbell) (1865–1940), was a celebrated actress. Her first London appearance was in 1890 in *The Hunchback*. She made her film debut in 1930 in *The Dancers*.

Campbell, Thomas (1777–1844), Scottish poet who at 22 published *The Pleasures of Hope*. He was one of the founders of University College, London, and is chiefly remembered for his war songs and the poems *Ye Mariners of England*, *The Battle of the Baltic*.

Campbell-Bannerman, Rt. Hon. Sir Henry, G.C.B. (1836–1908), Prime Minister in the Liberal Ministry from December 1905 until shortly before his death in April 1908. His Government at once faced a General Election and obtained a very large majority. Notable events of his period of office were the Trades Disputes Act, 1906, the Deceased Wife's Sister Act, 1907, and the simmering quarrel between the Liberals and the House of Lords, while the settlement of the South African problem was to a great extent due to his efforts. His Ministry contained a galaxy of talent—Grey, Haldane, Lloyd George, Asquith, Morley, Churchill—and was mainly held together by his personal popularity.

Camus, Albert (1913–60), important French writer, native of Algiers, whose works show the influence of existentialism. The Nobel Prize was awarded him in 1957 for "his important literary work, which has with penetrating seriousness thrown light on the problems of human conscience in our times." His most well-known novels are *l'Etranger* (1942), *La Peste* (1947), *l'Homme Révolté* (1952). Killed in car crash.

Canaletto, Giovanni Antonio (1697–1768), Venetian artist who excelled in the art of architectural painting. Some of his work is in the National Gallery, and there is a fine collection at Windsor.

Canning, Rt. Hon. George (1770–1827), entered Parliament in 1793 and became a great orator and a devoted adherent of Pitt, under whom he served first as Under-Secretary of State and later as Treasurer to the Navy. He was Secretary for Foreign Affairs under the Duke of Portland, and in 1827 became Prime Minister, but died four months later.

Cannizzaro, Stanislao (1826–1910), Italian chemist who rendered great service to scientific education and whose work provided the basis of modern quantitative chemist. He was professor of chemistry at Genoa, Palermo, and Rome.

Canova, Antonio (1757–1822), an Italian sculptor, leader of the classical revival in Italy, whose works achieved the first eminence.

Canute the Great (995–1035), invaded England with a Danish force, and in 1013 succeeded in dethroning Ethelred the Unready, and setting up his own father, Sweyn, in Ethelred's stead. Sweyn dying in 1014, Canute claimed the crown, but it took him some years to establish himself firmly.

Capablanca, José Raoul (1888–1942), world's chess champion, 1921–27; defeated by Alekhine.

Čapek, Karel, Ph.D. (1890–1938), Czech author and journalist whose *R.U.R.*, *Insect Play* and *Adam the Creator* have been produced in England.

Capone, Al (1900–47), notorious U.S. gangster, uncrowned king of Chicago during the prohibition era. Suspected of instigating many murders, but evaded justice until brought to trial on Income Tax charges. Sentenced to eleven years' imprisonment in 1931, but released in 1939.

Caractacus was the name by which a Prince of ancient Britain became famed for his resistance to the Romans in the 1st century. He was ultimately captured and taken prisoner to Rome where the Emperor Claudius was so moved by his dignity of bearing that he pardoned him.

Carey, William, D.D. (1761–1834), the first Baptist missionary to proceed to India, and from 1800 to 1830 Professor of Oriental Languages at Port William College, Calcutta. Became famed as an Oriental scholar, and published twenty-four different translations of the Scriptures.

Carissimi, Giacomo (1604–74), an Italian composer who is historically important for his development of the sacred cantata and the oratorio. Was maestro at Assisi, and later at Rome. The best collection of his works are in the National Library in Paris, and in the library of Christ Church, Oxford.

Carlyle, Thomas (1795–1881), was educated at Edinburgh University, and, after passing through some years of teaching drudgery, settled in London in 1824 and began the career of a serious man of letters; but, marrying Jane Welsh in 1826, he returned to Scotland and spent the next few years on a farm at Craigenputtoch, coming to London again in 1834. His *Sartor Resartus* was published in 1833. In 1837 he gave lectures in London, and in 1839 his *Chartism* appeared. His *French Revolution*, *Past and Present*, *Life and Letters of Oliver Cromwell*, *Latter-Day Pamphlets*, and *Frederick the Great* were works of noble conception.

Carnegie, Andrew (1835–1919), b. in Dunfermline, emigrated to America with his father in 1848, and after passing through much menial employment became connected with the Pennsylvania Railroad as Divisional Superintendent at Pittsburg, and ultimately established the Carnegie iron works, from which he retired in 1901 with a fortune of many millions. His munificent gifts for Free Libraries, educational work, and charitable objects are well known.

Carnot, General Lazare Nicolas Marguerite (1753–1823), was a prominent figure in the French Revolution, and author of an important work on fortification.

Caroline, Queen, wife of George IV. (1768–1821), was married to her husband in 1795 while he was Prince of Wales. The royal couple lived together only a very short time. When George succeeded to the throne in 1820 the Queen took steps to assert her position, and the King retaliated by having a Bill introduced to dissolve the marriage; the result was the famous trial before the House of Lords, when Lord Brougham distinguished himself by a most eloquent defence of the Queen. The Bill was passed by a narrow majority, but public feeling was too strong on the side of the Queen to admit of its being enforced.

Carrel, Dr. Alexis (1873–1944), American surgeon who won the Nobel Prize in 1912 for his remarkable achievements in suturing blood vessels and in the transplantation of organs. Member of the Rockefeller Institute for Medical Research 1906–44. A Frenchman by birth.

Carroll, Lewis. (*See* **Dodgson, Charles Lutwidge.**)

Carson of Duncairn, Lord, P.C. (1854–1935), had a highly successful career first at the Irish and then at the English Bar. Solicitor General for Ireland 1892; and for England 1900–6. Attorney General 1915; First Lord of the Admiralty 1917; Lord of Appeal 1921–29. Led a semi-militant organisation against the Home Rule Bill 1912–14.

Carter, Howard (1873–1939), Egyptologist and archaeologist who was associated with the 5th Earl of Carnarvon in discovering in 1922 the tomb of Tut-Ankh-Amen in the Valley of Kings, Egypt.

Cartier, Jacques (1494–1557), 16th-century navigator, born at St. Malo, whose exploration of Canada, and especially of the gulf and river of St. Lawrence, proved of great geographical importance.

Cartwright, Edmund, D.D. (1743–1823), invented the power loom, and also a wool-combing machine. Although these inventions were developed into fortune-making instruments, they benefited their inventor but little, and in 1809 Parliament made him a grant of £10,000. In 1904 a Cartwright Memorial Hall was opened at Bradford, the gift of Lord Masham.

Caruso, Enrico (1873–1921), a celebrated tenor, was born in Naples, and made his first operatic appearance in his native city. His success was unbounded.

Carver, George Washington (1864–1943), American negro agricultural chemist of world repute.

Casabianca, Louis de (*c.* 1754–1798), captain of the French flagship *L'Orient* at the Battle of the Nile. He and his ten-year-old son died together in the burning ship, refusing to quit the vessel.

Casals, Pablo (b. 1876), the famous Spanish violoncellist and conductor, who made his first appearance in Paris and London in 1898. He exiled himself from Spain in 1938 as a protest against dictatorship.

Cassatt, Mary (1845–1926), American painter and etcher. Spent most of her life in France, greatly influenced by the Impressionists and enjoyed friendship of Degas and Manet. Motherhood was her favourite subject.

Cassini, the name of a French family of Italian origin, distinguished for their services to astronomy and geography, who through four generations (1671–1793) were heads of the Paris Observatory.

Cassius, Caius Longinus, a distinguished Roman general who opposed the Dictatorship of Julius Cæsar, and took part in his murder. He died in 42 B.C., after being defeated by Mark Antony.

Castellani, Sir Aldo, Hon. K.C.M.G. (b. 1877), Italian scientist and foremost living authority on tropical diseases. Discovered the cause of sleeping sickness and other tropical diseases.

Castlereagh, Viscount, K.G., P.C. (1769–1822), British Minister of War and Foreign Secretary during the Napoleonic wars, who incurred much unpopularity because of the disastrous condition of home affairs. Succeeded to the Marquessate of Londonderry in 1821, and ended his life by suicide the following year.

Cather, Willa Silbert (1876–1947), American author; writer of beautiful English prose in novels of rare charm. Most of her scenes are

laid in the mid-western prairies; *The Song of the Lark*, *My Antonia*, *A Lost Lady*.

Catherine, St., was the name borne by a celebrated virgin of Alexandria, who was put to death in 307 for professing Christianity, being, according to some accounts, tortured on a spiked wheel before execution, though other authorities aver that the intended torture was miraculously prevented. From this we get the term "St. Catherine's wheel." Her festival is on November 25th.

Catherine of Aragon (1485–1536), first wife of Henry VIII., was previously the wife of Arthur, Henry's elder brother, who died shortly after the marriage. She was the daughter of Ferdinand and Isabella of Spain, aunt of the Emperor, Charles V, and mother of Mary Tudor. Henry's failure to obtain papal consent to the dissolution of their marriage precipitated the Reformation crisis in England.

Catherine the Great (1729–96), Empress Catherine II of Russia. Daughter of a Prussian general, she married in 1745 the future Peter III, a weakling, later deposed and murdered. Intelligent, cultivated, autocratic, she proved herself a capable ruler for a time but was hampered and opposed by the landed interests and, despite plans for reform, her reign was marked by imperialist expansion and extension of serfdom.

Catherine de' Medici (1519–1589), wife of Henry II. of France, and a woman of commanding power and influence, especially during her Regency, which continued while her son Charles IX. was in his minority. Her antagonism to the Protestants may have led to the Massacre of St. Bartholomew. In spite of her cruelty, she was an able woman, and showed a great appreciation of art and literature.

Cato, Marcus Porcius (234–149 B.C.) a Roman statesman, soldier, and writer, of strict virtue, simplicity and wisdom, who strongly condemned the luxury of his time and carried out his duties as Censor so rigorously that he became known as "Censorious."

Catroux, Gen. Georges (b. 1879), French soldier, who saw much service with the Foreign Legion. When Gov.-Gen. of Indo-China declared adherence to the Free French, 1940, and became C.-in-C. Free French in Levant,, 1941–43. French Ambassador to U.S.S.R., 1945–46.

Catullus, Caius Valerius (87–54 B.C.), an elegant Roman poet, whose lyrics to Lesbia are amongst the finest compositions of the kind in literature.

Cavell, Edith Louisa (1865–1915), a British nurse and patriot who assisted wounded British soldiers to escape over the Dutch frontier from Belgium during the Great War. She was shot by the Germans.

Cavendish, Hon. Henry, F.R.S. (1731–1810), English chemist and physicist who made researches into the nature of gases. Is chiefly remembered for his discovery of the chemical composition of water. He also discovered hydrogen (1766).

Cavour, Count Camillo Benso (1810–1861), a distinguished Italian statesman, who, as Premier to Victor Emmanuel, did much for the unification of Italy.

Caxton, William (1422–1491), was born in Kent and employed in commerce for a time. While visiting Flanders he obtained an insight into the then new invention of printing, and afterwards set up a printing-press of his own at Westminster.

Cecil of Chelwood, 1st Viscount, P.C., Q.C., C.H. (1864–1958), third son of the third Marquess of Salisbury. Took part in the Peace Conference, 1919, and helped to draft the Charter of the League of Nations. Awarded Nobel Prize for Peace, 1937.

Cecilia, Saint, the patron saint of music, martyred in Sicily under Marcus Aurelius (*c.* 176). She became patroness of music only about the beginning of the 15th century when painters showed her with harp, organ, or other musical instruments. Her festal day is Nov. 22.

Cellini, Benvenuto (1500–71), Italian sculptor and goldsmith of the later Renaissance. Possessed remarkable talent and skill, and produced innumerable works of great accomplishment, decorative and exquisite in detail, most of which have perished. Some examples are to be found in the Vienna Museum, the Louvre, and in the Metropolitan Museum. His famous bronze statue *Perseus with the Head of Medusa* can be seen in the Loggia dei Lanzi, Florence. His fame, however, rests more on his *Autobiography*, which gives a vivid account of the period and of his own craft.

Celsius, Anders (1701–44), Swedish physicist and astronomer who became professor of astronomy at Uppsala in 1730 and worked at the new Uppsala observatory, 1740–44. He invented the Centigrade or Celsius thermometer with freezing point of water at the zero-degree and boiling point at the 100-degree point.

Cervantes Saavedra, Miguel de (1547–1616), famous throughout the world as the author of *Don Quixote*, a wonderful study of feudalism in decay in which is to be found much social science. He had a most adventurous career, taking part in many military expeditions, and not turning to literature until his retirement from the profession of arms. In spite of the great success of his work he died in poverty and two centuries went by before he was honoured.

Cézanne, Paul (1839–1906), a French painter of power and originality, and intimate friend of Emile Zola. The famous portrait known as *La Vieille au Chapelet* was purchased by the National Gallery in 1953 and the Courtauld Collection in London includes, among others, the *Montagne Sainte Victoire*, and the *Lake of Annecy*.

Chadwick, Sir James, F.R.S. (b. 1891), physicist, one of Rutherford's most brilliant collaborators in the field of atomic research. Discovered the neutron in 1932, one of the main steps in the discovery of the fission process which led to the production of the atom bomb. Member (part-time) U.K. Atomic Energy Authority, 1958– ; Master of Caius College, Cambridge; co-author of *Radiations from Radioactive Substances*.

Chaliapin, Fedor Ivanovich (1873–1938), a world-famous Russian opera singer, a bass with great dramatic gifts.

Chamberlain, Rt. Hon. (Arthur) Neville (1869–1940), son of Joseph Chamberlain by his second wife. Prime Minister, 1937–40. His appeasement policy, which culminated in the Munich Agreement of 1938, has been the subject of much criticism.

Chamberlain, Rt. Hon. Joseph (1836–1914), did much active municipal work at Birmingham. In 1876 he entered Parliament, and at first was an enthusiastic Liberal with Republican tendencies and served in various offices under Mr. Gladstone. When the Home Rule split occurred, he became the most active member of the Liberal-Unionist party. In 1895 he accepted office as Secretary of State for the Colonies under Lord Salisbury, and in that post won a great reputation, notwithstanding the fact that during his term of office he had the Boer War to contend with. In May, 1903, he caused great sensation by suddenly advocating a scheme of fiscal reform, involving a partial return to Protection. This policy was afterwards adopted as one of the leading planks of the Unionist platform.

Chambers, Sir William, R.A. (1726–1796), a British architect, who rebuilt Somerset House in 1775, He also laid out Kew Gardens and designed the Pagoda there.

Chaminade, Cécile (1857–1944), French pianist and composer of orchestral music, ballets, songs, and charming piano pieces.

Champlain, Samuel de (1567–1635), a French navigator who founded Quebec in 1608, and in the following year discovered the lake known by his name.

Chantrey, Sir Francis Legatt, R.A. (1781–1842), a renowned English sculptor who contributed many fine statues to Westminster Abbey and St. Paul's. His famous "Sleeping Children" tomb is in Lichfield Cathedral. He left a considerable fortune to the Royal Academy for the purchase of works of art executed in Gt. Britain. The collection is in the Tate Gallery.

Chaplin, Charles Spencer (b. 1889), who gained world-wide fame as a film-star comedian, was born in London and appeared on the variety stage at the age of seven, going to the U.S.A. in 1910. He first appeared on the films in 1913. His most famous films include *The Tramp*, *Shoulder Arms*, *The Kid*, *The Gold Rush*, *The Circus*, *City Lights*, *The Great Dictator*, *Modern Times*, *Monsieur Verdoux*, and *Limelight*. His art is universally appreciated. In 1953 de-

cided not to return to America but to live in Switzerland.

Chapman, Sydney, M.A., D.Sc., F.R.S. (b. 1888), mathematician and geophysicist who has made contributions of the highest importance to the kinetic theory of gases, terrestrial magnetism, and the phenomena of the upper atmosphere. Chief Prof. of Mathematics, Imperial College of Science, 1924–46; Pres. Int. Comm. which organised the International Geophysical Year.

Chapman, George (1559–1634), an Elizabethan dramatist, who acquired more fame by his translation of Homer than by his plays. Keats's sonnet *On Reading Chapman's Homer* is a splendid tribute to the old dramatist.

Charcot, Dr. Jean Baptiste Etienne Auguste (1867–1936), a famous French explorer, who in 1903–05 and 1908–10 commanded expeditions which carried out important work in mapping, sounding, etc., in the South Polar regions. Charcot Island in the Antarctic Ocean, which he discovered in 1905, is named after him.

Chares (c. 300 B.C.), Rhodian sculptor. He was the sculptor of the Colossus of Rhodes, a gigantic bronze statue of the Sun-God, and one of the Seven Wonders of the World. The statue was destroyed after 56 years, in the earthquake of 224 B.C.

Charlemagne ("**Charles the Great**") (742–814), a wise and powerful ruler, general and statesman, who from being King of the Franks became Emperor of the Romans, and governed an empire comprising Gaul, Italy, and large parts of Spain and Germany.

Charles, Jacques Alexandre César (1746–1823), French physicist, the first to use hydrogen gas in balloons and who anticipated Gay–Lussac's law of the expansion of gases on heating.

Charles Edward (Stuart) (1720–1788), the "Young Pretender" as he came to be called, grandson of James II., and the hero of 1745, lived in exile after Culloden, and his later career was mainly one of dissipation.

Charles I. (1600–1649), King of England, Scotland, and Ireland (1625–49), succeeded his father James I in 1625, and from the first was in more or less conflict with Parliament. His monetary demands and unjust taxation led to the violent opposition which resulted in the Civil War. He was beheaded in front of the Banqueting House at Whitehall, Jan. 30, 1649.

Charles II. (1630–1685), King of England, Scotland, and Ireland (1660–85), eldest son of Charles I. He was in command of the Royalist forces in the West during the Civil War, and escaped to the Continent after Naseby. Subsequently he became King at the Restoration, and, following upon the sober quietude of the Commonwealth period, formed an acceptable change to the people at large until, by his excesses, of one kind and another, he proved his unkingliness of character. He contrived to keep himself fairly popular, however, despite his extreme selfishness. Granted first Charter to the Royal Society.

Charles V. (1500–1558) was the dominating European figure for many years, being Emperor of Germany and King of Spain, at a time when his tactful policy enabled him to guard the interests of both Catholics and Protestants with considerable success.

Charles XII of Sweden (1682–1718), a brave but impulsive monarch whose reign was distinguished by the great Nordic War against Denmark, Poland, and Russia. Peter the Great decisively defeated him at Poltava in 1709. In 1718 he invaded Norway and was killed while besieging the fortress of Fredrikshald.

Chateaubriand, François René, Vicomte de (1768–1848), French writer and diplomat who in the midst of an adventurous and somewhat eccentric political career wrote a number of stories, poems, and essays which reflect the richness of his personality and give him a unique place in French literature. He was the friend of Mme Récamier for many years. His last years were spent in writing *Mémoires d'outre-tombe* (memoirs from beyond the tomb).

Chatham, William Pitt, Earl of (1708–1778), had a long and distinguished career as a statesman, and was the most eloquent Parliamentarian of his time. In the long conflict with France that preceded the American War of Independence, Chatham showed great resourcefulness and vigour, but his patriotic efforts were of little avail against the obstinacy of the King and his party, and he ultimately retired from contention, only making a last appearance in the House of Lords to urge a greater resistance to the war with the American Colonists, and, after a powerful speech, fell back in an apoplectic fit and died a few weeks later, being buried in Westminster Abbey.

Chatterton, Thomas (1752–1770), young English poet of remarkable talent, unappreciated until after his death. Unsuccessfully tried to pass off his writings as newly discovered ancient manuscripts and killed himself at the age of 17.

Chaucer, Geoffrey (c. 1343–1400). Achieved immortality by his *Canterbury Tales*, giving a most graphic description of the life and characters of his time. He was buried in Westminster Abbey.

Chekhov, Anton (1860–1904), Russian dramatist and short-story writer, whose plays include *The Cherry Orchard*, *Uncle Vanya*, *The Three Sisters*.

Cherubini, Maria Luigi Carlo Zenobia Salvatore (1760–1842), a Florentine musician, for many years director of the Paris Conservatoire and composer of operas and church music. Admired by Beethoven and Mendelssohn.

Chesterfield, Earl of, K.G. (1694–1773), the fourth Earl, and a statesman of note. His fame rests, however, upon his *Letters to his Son*, which for purity of style and grace of expression have seldom been excelled, though the moral they point is not always one that modern ideas would endorse.

Chesterton, Gilbert Keith (1874–1936), was one of the most active of our modern writers. Contributed to the *Illustrated London News*, etc., and kept himself in evidence in many literary and journalistic quarters; handled social questions, art, politics, and criticism with dexterity and audacity. Published studies of the lives and works of Robert Browning and Charles Dickens. Completed writing his own autobiography shortly before his death.

Chevalier Albert (1861–1923), English music-hall comedian of great originality; celebrated for his coster sketches and songs.

Chevalier, Maurice (b. 1889), French stage and film actor.

Chiang Kai-shek, Generalissimo (b. 1887), former President of China and member of the Kuomintang Party. Emerged from the welter of events succeeding the death of Sun Yat Sen in 1925 as the leading man in China, a position he maintained for a quarter of a century of trouble and bloodshed. The successful conclusion of the long and costly Japanese war was followed by civil war with the Communists in North China. In January 1949 he withdrew from the office of President following military defeat by the Communists and the collapse of the Kuomintang régime. Became a Christian of the Methodist confession shortly after his marriage to Soong Mei-ling the sociologist.

Chippendale, Thomas (c. 1717–1779), a celebrated designer of furniture whose examples are now highly prized and fetch big prices. He was a native of Worcestershire, but made his name in London, having a shop in St. Martin's Lane.

Chirico, Giorgio de (b. 1888), painter associated with surrealism, born in Greece of Italian parents.

Chopin, Frédéric François (1810–1849), Polish pianist and composer, son of a French father and Polish mother. He has been called "the poet of the piano" because of the originality and delicacy of his playing. His music, composed mostly for the piano, includes preludes, mazurkas, impromptus, nocturnes, études, sonatas, and a barcarolle and a berceuse. He enjoyed Paris intellectual and musical society, and played in numerous concerts all over Europe. He died of consumption and was buried in Père-Lachaise, next to his friend Bellini.

Chou-En-lai, General (b. 1898), Prime Minister of the Chinese People's Republic since 1949; Foreign Min. 1949–58. Took important part in Geneva Conference of 1954, where his talents for negotiation helped to bring to an end the 8 years' war in Indo-China and the new China into world diplomacy.

Chrysostom, St. John (347–407), a father and

saint of the Greek Church who was made Archbishop of Constantinople and was famous for his eloquent preaching and persuasive writing.

Churchill, Rt. Hon. Lord Randolph (Henry Spencer), P.C. (1849–1895), was the third son of the seventh Duke of Marlborough. Entered Parliament in 1874, and four years later became prominent on the Conservative side for his scathing attacks on what he called the "Old Gang" of his own Party, and was one of Mr. Gladstone's most severe critics. In 1885 he became Secretary for India, and in the following year was Chancellor of the Exchequer and Leader of the House of Commons, but after a few months of brilliant work resigned on some difference of opinion with his colleagues, and never again held office.

Churchill, Rt. Hon. Sir Winston (Leonard Spencer), K.G., O.M., C.H., M.P. (b. 1874), British statesman, soldier, and author, son of the last-named. Prime Min. and Min. of Defence, 1940–45. Leader of the opposition, 1945–51 and Prime Min. from 1951 until his retirement in 1955. M.P. for Woodford since 1945. M.P. for the Epping Division of Essex, 1924–45. Was with the British force during the Indian frontier troubles of 1897–98; served in the Sudan Campaign, and during the Boer War had many dramatic adventures. Became a prominent figure in Parliament, and worked heartily for the Conservatives until Mr. Chamberlain brought out his fiscal proposals, when he declared against them in the most emphatic manner, and eventually joined the Liberal ranks. Under-Secretary for the Colonies, 1905–08; President of the Board of Trade, 1908–10; Home Secretary, 1910–11. First Lord of the Admiralty, 1911–15 and 1939–40. Chancellor of the Duchy of Lancaster, 1915. Minister of Munitions, 1917; Minister of War, 1918–21; Minister of Air, 1919–21. Sec. of State for the Colonies, 1921–22. Chancellor of the Exchequer 1924–29; Lord Rector of Aberdeen University, 1914–18; Lord Rector of Edinburgh University, 1929–32; Chancellor of Bristol University, 1930; Leader of Conservative Party, 1940–55. Lord Warden of the Cinque Ports since 1941. Has exhibited in the Royal Academy, was elected Academician Extraordinary in 1948, and is the author of many famous books. Awarded Nobel Prize for Literature in 1953.

Chulalongkorn, Phra Paramindr Maha (1853–1910), great Siamese monarch whose appreciation of foreign institutions inspired him to carry out many reforms in his country.

Cibber, Colley (1671–1757), a London actor and dramatist of great repute in his day. *The Careless Husband*, and *Love's Last Shift* are the best of his comedies. Poet Laureate 1730–57.

Cicero, Marcus Tullius (106–43 B.C.), a Roman Republican orator and philosopher. His younger brother, Quintus Tullius Cicero (102–43 B.C.), was a Roman soldier of some note. Both were slain.

Cid (El Campeador) (*c.* 1035–1099), the name given to the famous Spanish knight, Rodrigo Diaz, Count of Vivar, whose exploits in battle and adventure made him the national hero. He drove the Moors out of Spain before he had completed his twentieth year.

Cierva, Juan de la (1895–1936), the Spanish engineer who invented the autogiro.

Cimabue, Giovanni (1240–1302), a Florentine painter whose real name was Cenni di Pepo, master of Giotto, and the leader of the movement which led to the formation of what is called the Florentine school. The frescoes attributed to him are of great beauty.

Cimarosa, Domenico (1749–1801). One of the earliest Italian composers whose works in his time were as popular as they were numerous. Was composer to the Russian Court from 1789 to 1792. His most popular opera during his lifetime was *Il Matrimonio Segreto*, and it is still to-day the most frequently heard of his works.

Cimon (*c.* 507–449 B.C.), Athenian statesman and general, son of the great Miltiades who commanded at Marathon. He worked for friendship with Sparta to unite forces against Persia. Decisively defeated Persian land and sea forces at the mouth of the Eurymedon in 468 B.C. Died at the siege of Citium, in Cyprus.

Cipriani, Giovanni Battista (1727–85), Florentine painter and engraver who worked in London and was one of the foundation members of the Royal Academy. Collections of his pen-and-ink drawings are in the British Museum and Victoria and Albert Museum.

Citrine, 1st Baron P.C., K.B.E. (b. 1887), English trade-union official who rose to a prominent position in the Electrical Trades Union, of which he was Asst. Gen. Sec., 1920–23; Pres. Int. Fed. of Trade Unions, 1928–45; Gen. Sec. Trades Union Congress, 1926–46; Mem. Nat. Coal Board, 1946–47; Chair. Central Electricity Authority, 1947–57; Mem. (part-time) Electricity Council, 1958– ; Mem. (part-time) U.K. Atomic Energy Authority, 1958– .

Clair, René, (b. 1898), French-film producer, whose early films which were full of wit and satire included *Sous les Toits de Paris* and *A Nous la Liberté*.

Clarendon, Edward Hyde, 1st Earl of (1609–1674), a statesman of great ability who filled the office of Lord High Chancellor under Charles II., and for a time was in high favour but, refusing to pander to Charles's whims, was dismissed and went to live in retirement. His *History of the Rebellion* is a valuable work, having the advantage of being written by one who was a witness of, and often an important figure in, the events described. His daughter Anne was the wife of the Duke of York, afterwards James II., and it was her daughter who became Queen Anne. Clarendon died in exile at Rouen.

Clark, Sir Kenneth McKenzie, C.H., K.C.B. (b. 1903), British art critic. Director of the National Gallery, 1934–45. Chairman, Arts Council of Great Britain, 1953– ; Chairman of the Independent Television Authority, 1954–57.

Clark, Wilfred Edward le Gros, M.A., M.D., D.Sc., F.R.C.S., F.R.S. (b. 1895), anatomist and anthropologist; Prof. of Anatomy, Oxford Univ. since 1934; one of the scientists to expose the forgery of the Piltdown skull.

Clarke, Marcus Andrew Hislop (1846–81), Australian novelist, born in London. Emigrated to Australia in 1863, where he became a journalist. During his stay in Tasmania he wrote *For the Term of his Natural Life*, which has become a minor classic.

Clarkson, Thomas (1760–1846), was one of the leaders of the Negro Emancipation movement, to which he devoted the main part of his life.

Claude Lorrain (1600–1682), the most famous landscape painter of his century. His real name was Claude Gelée, and he was born at Chamange in the Vosges, going from France to Rome as a lad and there laying the foundation of his worldwide celebrity. He lived in Rome most of his life.

Claudius I. (10 B.C.–A.D. 54), Emperor of Rome, who succeeded his nephew Caligula when he was murdered. He was the grandson of Tiberius Claudius Nero, erected many imposing buildings in Rome, and visited Britain. In his later years he became the tool of favourites, and was poisoned by his wife Agrippina.

Clausewitz, Gen. Carl von (1780–1831), Germany's greatest military expert. His classic book *Vom Kriege*, which expounds his theories on war, dominated Prussia in the nineteenth century, and is still studied in military schools throughout the world.

Clemenceau, Georges Eugène (1841–1929), a prominent French statesman and editor of strong Radical tendencies who supported General Boulanger for a time and then bitterly opposed him. Was still a leading exponent of French Radicalism, though he sacrificed his independent position to become Premier and Minister of the Interior in October, 1906–1909, Prime Minister and Minister for War, France, 1917–20. Was a great orator, and a sturdy defender of Dreyfus.

Clemens, Samuel Langhorne ("Mark Twain") (1835–1910). After the Civil War drifted into journalism, making himself popular as a humorist in 1869 by his *Innocents Abroad*, the result of a trip to Europe. His other works include *A Tramp Abroad*, *Tom Sawyer*, *Huckleberry Finn*, and *Pudd'nhead Wilson*.

Cleopatra (69–30 B.C.), daughter of Ptolemy XI, the sixth queen of Egypt by that name, a brilliant, ambitious woman of captivating charm. On the death of her father in 51 she became

joint sovereign with her younger brother Ptolemy XII, whom she married in accordance with Egyptian custom. She was banished to Syria, but obtaining the help of Cæsar, led a revolt and won the kingdom for herself. Cleopatra and Cæsar became lovers. In 47 she bore him a son Cæsarion (later Ptolemy XIV) and followed him to Rome. After the murder of Cæsar she returned to Egypt, where in 41 she was summoned to meet the triumvir Mark Antony. He fell in love with her and became enslaved. She bore him twins Alexander Helios and Cleopatra Selene. He deserted Octavia his wife and broke with Octavian (later Augustus), his brother-in-law, in an attempt to re-establish the power of Egypt. Antony and Cleopatra were, however, defeated at Actium in 31 B.C. and at Alexandria. Antony fell upon his sword, and Cleopatra, unable to influence Octavian, killed herself by allowing an asp to bite her. The drama of her life has been described by Shakespeare in *Antony and Cleopatra* and by Shaw in *Cæsar and Cleopatra.*

Clive, Robert, Lord (1725–1774), went out to India as a clerk in the service of the East India Company when 17, and during the diplomatic difficulties which arose between England and France attracted the attention of his superiors by some able suggestions for the curbing of the French influence. In the war that followed he was given a command and displayed such remarkable military genius that he virtually became Commander-in-Chief. In the troubles that followed with the native rulers, he was equally resourceful, and succeeded in laying the foundation of the British empire in India on a secure basis. On his return to England in 1760 he was raised to the peerage. His latter years were marked by mental disturbance and ultimately he committed suicide.

Clovis (*c.* 465–511) was the founder of the Merovingian-line of Frankish kings, and a convert to Christianity. He defeated the Burgundians and West Goths, and fixed his court at Paris.

Clyde, 1st Baron, Colin Campbell, K.C.B. (1792–(1863), a British Field-Marshal who served in the Peninsular and Crimean wars and made a great reputation as Commander-in-Chief in India during the Mutiny.

Cobbett, William (1762–1835), a politician and controversialist, who, through the medium of his *Political Register*, attacked both Radical and Tory in turn. Entered Parliament in 1832. In 1830 his *Rural Rides* were published in book form.

Cobbold, Cameron Fromanteel, P.C. (b. 1904), Governor of the Bank of England since 1948.

Cobden, Richard (1804–1865), the son of a Sussex farmer, who afterwards became a commercial traveller, and during the Corn Law Agitation came into great prominence as an advocate of Free Trade. He devoted himself so completely to this cause, that for some years he entirely neglected his business affairs and in recognition of his services a subscription of £80,000 was raised for him in 1845, and in 1860 a further sum of £40,000. He entered Parliament in 1841, and except for an interval of two years remained a member till his death. In 1860 he negotiated a commercial treaty with France which was of great benefit to the trade of this country. Titles and other honours were offered to him but declined.

Cochran, Sir Charles Blake (1872–1951), a prominent English theatrical manager and producer who began as an actor in America. Among his many successes were *Bitter Sweet*, *Cavalcade*, and a number of brilliant revues.

Cockroft, Sir John Douglas, K.C.B., O.M., C.B.E., M.A., Ph.D., F.R.S. (b. 1897), Cambridge nuclear physicist who shared with Dr. E. T. S. Walton the 1951 Nobel Prize. Dir. Atomic Energy Research Estab. at Harwell, 1946–58; Member (Research) U.K. Atomic Energy Authority, 1958–59, Member Advisory Council on Scientific Policy, 1959– ; Master of Churchill College (new college to be built at Cambridge for scientists and technologists).

Cocteau, Jean (b. 1891), French writer and artist whose achievements in widely varied forms of art have been prodigious. Elected to the Académie Française in 1955.

Cody, Samuel Franklin (1861–1913), British aviator, born in U.S.A., but became a naturalised British subject. He was the first man to fly in Great Britain—making a flight of 27 minutes in October 1908 in the first practical British flying-machine of his own make. Was killed while flying in 1913.

Cody, William Frederick (1846–1917), American showman, known as "Buffalo Bill," who in 1883 founded his great Wild West show.

Cohn, Ferdinand Julius (1828–1898), the famous German bacteriologist, of which science he was the virtual founder.

Coke, Sir Edward (1552–1634), Attorney-General under Elizabeth and Chief Justice under James I; great rival of Francis Bacon. His extensive legal erudition added many new interpretations to the Common Law system. Among his publications are his four *Institutes*, the first of which (*Coke upon Littleton*) is very famous.

Colbert, Jean Baptiste (1619–83), French statesman, who fostered new industries and encouraged commerce, endeavoured to reform the finances, and established the French Navy on a sound basis. A patron of literature, science and art.

Cole, George Douglas Howard, M.A., (1889–1959), British economist, sociologist, and writer: Chichele Professor of Social and Political Theory at Oxford, 1944–57; Chairman Fabian Society, 1939–46; Pres. Int. Society for the Study of Socialism from 1956 until his death. Among his numerous writings on social and economic problems are *The Intelligent Man's Guide through World Chaos* (1932), *The Post-War Condition of Britain* (1956), *The Case for Industrial Partnership* (1957).

Coleridge, 1st Baron (1820–94), Lord Chief Justice of England from 1880 until his death. Was a distinguished scholar, orator and barrister, his most famous case being the Tichborne trial in 1871, when his speech for the defence lasted 23 days.

Coleridge, Samuel Taylor (1772–1834), one of the great poets of the early part of the 19th century, whose *Ancient Mariner* and a few other poems stand unsurpassed for poetic beauty and originality.

Coleridge-Taylor, Samuel, A.R.C.M. (1875–1912), British composer, the son of a West African negro doctor practising in London, and an Englishwoman. He studied at the Royal College of Music where his *Hiawatha's Wedding Feast* was performed in 1898.

Colet, John (*c.* 1467–1519), humanist and divine, founded St. Paul's School, 1512. As scholar and friend of Erasmus he helped to bring the New Learning to England.

Colette, (**Sidonie Gabrielle Claudine Colette**) (1873–1954), author of a number of highly successful novels including the famous *Claudine* stories, *Chéri* and *La Fin de Chéri*. Grand Officier de la Légion d'Honneur (1953).

Collier, Hon, John (1850–1934), English painter who became highly popular for his "problem" pictures. He is best remembered, however, as a distinguished portraitist.

Collingwood, Lord (1750–1810), British admiral whose ship the *Royal Sovereign* led the fleet to battle at Trafalgar and who on Nelson's death assumed the command.

Collins, Michael (1890–1922), brilliant and daring Irishman, leading spirit of the Sinn Fein political movement. Took part in the Easter Rebellion and organised the guerilla warfare which eventually led to the breakdown of British government and to the Anglo-Irish Peace of Dec. 6, 1921. Killed in ambush by Republicans after his return from England.

Collins, William, R.A. (1788–1847), a noted landscape and figure painter, and father of Wilkie Collins.

Collins, William Wilkie (1824–1889), the novelist, was for many years associated with Charles Dickens, and wrote *The Dead Secret*, *The Woman in White*, and *No Name*.

Colt, Samuel (1814–1862), of Hartford, Connecticut, invented the revolver and patented it in 1835. It was some time before its utility was recognised, but after being used with great effect in the war with Mexico it was universally adopted.

Columba, St. (521–597), the founder of the monastery of Iona, was a native of Ireland. From his lonely island shrine he made frequent missionary journeys to the Highlands of Scotland,

where he made many converts and was greatly revered.

Columbus, Christopher (*c.* 1446–1506), the famous Italian navigator, who, prevailing upon Ferdinand and Isabella of Spain to bear the expense of an expedition of discovery, set out on his first voyage in 1492. He first discovered the Bahamas, Cuba, and other West Indian islands, and, on his third voyage, in 1498, landed on the lowlands of South America.

Colvin, Sir Sidney (1845–1927), friend of R. L. Stevenson and biographer of Keats. Was Keeper of Prints at the British Museum, 1884–1912. Author of numerous works on art and literature.

Comenius, Johann Amos (1592–1670), famous Czech educationist. Was the first advocate of the "direct" method of teaching languages, of the use of pictures in education, and of the teaching of science.

Compton, Prof. Arthur Holly (b. 1892), American physicist whose work on X-rays led to the discovery of the so-called "Compton Effect," for which he shared with C. T. R. Wilson the 1927 Nobel Prize for Physics. He has also made important cosmic-ray investigations. His brother **Karl Taylor Compton** (b. 1887) is also a physicist who has taken an important part in radar and atomic bomb research.

Compton-Burnett, Ivy, British novelist, whose books deal with family relationships and include *Men and Wives*, *A House and its Head*, *Man Servant and Maid Servant*, *The Present and the Past*, *A Heritage and its History*.

Comte, Auguste (1798–1857), a French philosopher founder of positivism, and father of social philosophy.

Condé, Louis II., de Bourbon, Prince de, "The Great Condé" (1621–1686), was a distinguished military commander. Victor of Rocroi, 1643.

Confucius (*c.* 551–479 B.C.), Chinese philosopher and sage, founder of the great world religion of Confucianism. He was not concerned with the supernatural but appealed to reason and taught love and respect of one's fellows, superiority to ambition, charity, forgiveness, and repentance.

Congreve, William (1670–1729), was a famous Restoration dramatist, whose comedies of manners reflect the grossness of his age only too closely, but are redeemed by the brilliancy of his wit. He was buried in Westminster Abbey.

Conrad, Joseph (1857–1924), English novelist of Polish birth whose parents were exiled to France for political reasons. He became master mariner in the British merchant service and began to write novels after he left the sea in 1884. He has a beautiful prose style and is acknowledged to be a significant figure in English literature. His novels include: *Almayer's Folly* (1895), *Lord Jim* (1900), *Nostromo* (1904). Biography by Jocelyn Baines (1960).

Conscience, Hendrik (Henri) (1812–83), the famous Flemish novelist who wrote in 1838 his beautiful work *The Lion of Flanders*.

Constable, John, R.A. (1776–1837), was a native of East Bergholt, Suffolk, and became one of the greatest of English landscape painters. He had long to wait for recognition, but ultimately attained high honour and exerted a strong influence in the development of landscape art.

Constant, Jean Joseph Benjamin (1845–1902), a famous French painter of Oriental subjects and portrait painter. His "Prisoners in Morocco," "The Harem," and "The Emir's Favourite," are among his more celebrated pictures.

Constantine the Great (*c.* 272–337). Emperor of Rome from 306 to his death. Transferred the Capital of the Empire from Rome to Byzantium, thence called Constantinople after his name.

Constantine I. (1868–1923), King of Greece, 1913–17, and 1920; married Princess Sophia of Prussia, sister of the Kaiser.

Cook, Captain James (1728–1779), an adventurous navigator, whose *Voyages Round the World* is a classic. He made many discoveries in the name of Great Britain, including the Sandwich (now Hawaiian) Islands. He was murdered at Hawaii by natives.

Cooper, Sir Astley Paston, Bt., F.R.S. (1768–1841), one of the greatest surgeons of his time, and the author of several important medical textbooks.

Cooper, James Fenimore (1789–1851), was a very popular American novelist, who from about 1820 to the time of his death produced a succession of stirring stories of adventure, which enjoyed much popularity, among them *The Spy*, *The Last of the Mohicans*, *The Pathfinder*, and *The Deer Slayer*.

Cope, Sir Arthur Stockdale, K.C.V.O., R.A. (1857–1940), was a well-known portrait painter.

Copernicus, Nicholas (1473–1543), founder of modern astronomy, was born at Thorn on the Vistula, then under Polish suzerainty. Studied at Cracow and in Italy, lectured on astronomy and mathematics at Rome and in 1512 settled at Frauenburg, where he was canon of the cathedral. He also practised medicine. His beliefs concerning the universe were set forth in his great book *De revolutionibus orbium coelestium*, which was not published until his death for fear of the storm his revolutionary theories would raise. In it he proved that the planets, including the earth, revolve round the sun.

Coppée, François Joachim (1842–1908), one of the most popular of modern French writers, who as poet, novelist and dramatist, was equally successful.

Coquelin, Benoit Constant (1841–1909), eminent French actor ("Coquelin aîné"), and **Coquelin, Ernest** ("Coquelin cadet"), his youngest brother (1848–1909), were leading lights of the Théâtre Français.

Corelli, Arcangelo (1653–1713), Italian composer and the first great violinist to enjoy universal fame; founded the present art of violin playing and gave definitive form to the *concerto grosso*.

Corneille, Pierre (1606–1684) the French tragic dramatist, whose *Cid*, *Polyeucte*, *Le Menteur*, and other plays marked a new era in French dramatic production.

Cornwallis, 1st Marquess (1738–1805), commander of the British forces which surrendered to the Americans, at Yorktown in 1781, thus ending the War of Independence; was twice Governor-General of India.

Corot, Jean Baptiste (1796–1875), a French landscape painter of great repute.

Correggio, Antonio Allegri da (1494–1534), the great Italian painter of the Lombard School, whose "Ecce Homo" is in the British National Gallery.

Cortes (or Cortez), Hernando (1488–1547), a Spanish adventurer who earned great renown by capturing Mexico for Spain, and held that country in subjection for ten years.

Cortot, Alfred (*b.* 1877), eminent pianist, born at Nyon, Geneva, studied at the Paris Conservatoire and became chorus director at Bayreuth. Conducted the first complete performance in Paris of Wagner's *Ring*.

Cosgrave, William Thomas (b. 1880), President of Executive Council, Irish Free State, 1922–32; Finance Min., 1923; Defence Min., 1924; Parl. Chairman Fine Gael, 1933–44.

Costello, John A., S.C. (b. 1891), Prime Minister of Irish Republic 1948–51 and 1954–57. When Attorney General, Irish Free State, 1926–32, helped to draft the Statute of Westminster.

Coty, René (b. 1882), President of the French Republic, 1954–8.

Coulton, George Gordon, Litt. D., LL.D. (1858–1947), scholar and historian of the Middle Ages, whose main claim to fame rests upon *Five Centuries of Religion*, works in which he set forth his interpretation of monastic history in England from the Conquest to the Reformation.

Couperin. A notable family of French musicians who were organists at St. Gervais, Paris, from about 1650 until 1826. **François Couperin** (1668–1733), called "Couperin the Great," is the best known today for his harpsichord music.

Cousin, Victor (1792–1867), French educationist and philosopher who founded what is called the eclectic school of modern philosophy. He was a remarkable lecturer and his writings cover nearly the whole field of philosophy.

Cousins, Samuel, R.A. (1801–1887), the greatest mezzoprint engraver of his day, whose plates after Reynolds, Millais, Landseer, and Hogarth reach the highest point of this kind of art work.

Coverdale, Miles (1488–1568), one of the early English Reformers, was born in Yorkshire, and afterwards became a monk of Norwich and later Bishop of Exeter. He collaborated with Tyndale in translating the Bible; the Psalms still used in the Prayer Book are taken from their translation.

Coward, Noel (b. 1899), a successful English playwright and actor. His works include *Hay Fever*, *Private Lives*, *Blithe Spirit*, the operetta *Bitter Sweet* and the films *In Which We Serve*, *This Happy Breed*, and *Brief Encounter*.

Cowper, William (1731–1800), an English poet imbued with much piety of sentiment and a remarkable poetic talent. His *Task* is one of the great poems of the 18th century.

Cox, David (1783–1859), an eminent landscape painter—son of a Birmingham blacksmith—whose pictures are thoroughly English in spirit and treatment.

Crabbe, Rev. George (1754–1832), a poet of rural life and scenes, noted for his faithful pictures, characterisation and soundness of his sentiments.

Craig, Edward Gordon, C.H. (b. 1872), the son of the late Dame Ellen Terry, author of several books on stagecraft. Has produced many plays in England and on the Continent.

Cranmer, Thomas (1489–1556), Archbishop of Canterbury under Henry VIII, and Edward VI.; an ardent promoter of the Reformation. On Mary's accession at first consented to return to the old faith, but when called upon to make public avowal of his recantation, refused, and was burnt at the stake. His great contributions were the English Bible and Book of Common Prayer.

Crawford, Francis Marion (1854–1909), an American novelist who obtained considerable eminence by his stories of Italian life, including *A Roman Singer*, *Saracinesca*, and *Saint Ilario*.

Crichton, James (1560–1582). Scottish adventurer who earned considerable renown for his scholarly accomplishments and charm and was called "The Admirable Crichton." He was assassinated when only twenty-two years of age in Mantua.

Cripps, Rt. Hon. Sir (Richard) Stafford, C.H., Q.C. (1889–1952), British statesman and barrister, younger son of Lord Parmoor and nephew of Beatrice Webb. In charge of post-war Britain's economic affairs. His programme was one of purposeful austerity, but his outstanding ability and masterly exposition of the economic situation won him support from all sides. He showed that liberty and planning can be reconciled in the modern world. Labour M.P. for S.E. Bristol, 1931–50. Gave up a brilliant career at the bar to enter politics. Ambassador to Moscow, 1940–42, and Min. of Aircraft Production, 1942–45. Went on missions to India in 1942 and 1946. Resigned his seat in Parliament and as Chancellor of the Exchequer in 1950 because of broken health; was taken to Switzerland for a cure, but he did not recover.

Crispi, Francesco (1819–1901), noted Italian statesman, who aided Garibaldi and was his supporter throughout. Premier 1887–91 and 1893–96. Achieved many reforms for his country.

Crispin, St., a saint of the Roman Church and patron of shoemakers. In the 3rd century he and his brother, natives of Rome, settled in Soissons, France, and there preached Christianity, supporting themselves by shoemaking. Suffered martyrdom under Diocletian in 289, by being thrown into a cauldron of molten lead; commemorated on Oct. 25.

Croce, Benedetto (1866–1952), Italian philosopher and critic and one of the great figures of the 20th century. Devoted his long life to studying and writing, and his philosophy is expounded in the four volumes of *Filosofia dello Spirito* (which has been translated into English). He founded and edited *La Critica* in 1903, a review of literature, history, and philosophy. Strongly opposed to fascism, he was described during the war as "the grand old man who kept a torch burning in Naples which even Mussolini did not dare to extinguish."

Crœsus (died c. 546 B.C.) the last King of Lydia (560–546 B.C.), who reigned fourteen years, and acquired such immense wealth that his name has ever since been proverbial. He was a wise king, whose memory still survives in his wise sayings. Solon was his friend, and it was Solon's name that he uttered thrice while standing before the pyre on which Cyrus had condemned him to be burnt. This touched Cyrus, who spared his life and made him his companion. He succeeded his father Alyattes on the Lydian throne, 560 B.C.

Crome, John (1769–1821), known as "Old Crome," from being a humble house-painter became eminent as a painter of landscape.

Cromer, 1st Earl of, P.C., G.C.B., O.M., G.C.M.G., K.C.S.I., C.I.E., F.R.S. (1841–1917), a diplomatist who won celebrity in the post of British Comptroller-General in Egypt from 1883 to 1907. It was a stupendous task that he had imposed upon him, but he resolutely devoted himself to it, with the result that Egypt was lifted from financial difficulty and internal disorder to a condition of prosperity. In 1908 published *Modern Egypt* and *Ancient and Modern Imperialism* in 1910.

Crompton, Samuel (1753–1827), was a poor cotton worker at Bolton who invented the spinning mule, which greatly increased the power of cotton production. Received little recognition.

Cromwell, Oliver (1599–1658), Lord Protector of the commonwealth of England, Scotland and Ireland, 1653–58. Born at Huntingdon, educated at Sidney Sussex College, Cambridge, and entered parliament as member for Huntingdon in 1628. With outbreak of civil war served with the parliamentary army under Essex and won renown at Edgehill (1642). Celebrated as a great general, leader of his Ironsides, for his religious toleration, and strong foreign policy. His victories include Marston Moor (1644), Naseby (1645), Dunbar (1650), Worcester (1651).

Cromwell, Richard (1626–1712), son of the foregoing, and his successor in the Protectorate.

Cromwell, Thomas (1485–1540), originally a protégé of Wolsey, rose to high office under Henry VIII, and began the suppression of the monasteries. Executed after the failure of the Anne of Cleves marriage, which was part of his policy of alliance with the Protestant princes of Germany.

Crookes, Sir William, O.M., F.R.S. (1832–1919) eminent British scientist whose researches in chemistry and physics led to many important discoveries and inventions. He discovered the metal thallium in 1861, invented the radiometer and the Crookes' tube, which was used by J. J. Thomson and others in their researches on conduction of electricity in gases. He was also an authority on sanitation. President of the Royal Society, 1913–16.

Cruikshank, George (1792–1878), a celebrated book illustrator who was for a time associated with Charles Dickens, and later on illustrated numerous works of other novelists of his day, showing great humour and power of character-delineation.

Cummings, Bruce Frederick (1889–1917), English zoologist and man of letters. Won fame with his *Journal of a Disappointed Man*.

Cunard, Sir Samuel, Bt. (1787–1865), shipowner and co-founder of the British and N. American Royal Mail Steam Packet Co. which later became the Cunard Line and as a result of a merger in 1934, the Cunard-White Star Line, owners of the two largest liners afloat—the *Queen Elizabeth* and the *Queen Mary*.

Cunningham of Hyndhope, Admiral of the Fleet, Viscount, K.T., G.C.B., O.M., D.S.O. (b. 1883), won the D.S.O. and two bars in the first world war, C.-in-C., Mediterranean, 1939–42. Allied Naval C.-in-C., North African campaign. First Sea Lord, 1943–46.

Cunningham, General Sir Alan Gordon, G.C.M.G., K.C.B., D.S.O., M.C. (b. 1887), brother of Viscount Cunningham. Directed Abyssinian campaign and commanded 8th Army, 1941. From 1945 served as the last British High Commissioner in Palestine.

Cunningham, Admiral of the Fleet, Sir John Henry Dacres, G.C.B., M.V.O. (b. 1885), C.-in-C., Mediterranean, 1943–46. First Sea Lord 1946–48.

Curie, Prof. Pierre (1859–1906) and **Madame Marie** (1867–1934) are names that have become famous as the discoverers of radium. M. Curie was a Frenchman, Mme. Curie a Pole; they were both indefatigable scientific investigators. Shared the Nobel Prize for Physics 1903, while their daughter, the late Mme. Irène Joliot-Curie, shared with her husband the 1935 Nobel Prize for Chemistry, awarded for their researches in radioactivity.

Curzon of Kedleston, Marquess, K.G., P.C., G.C.S.I., G.C.I.E. (1859–1925), statesman and administrator. As a young man gained distinction as traveller and author. From 1899 to 1905 was a vigorous and outstanding Viceroy of India. Foreign Secretary, 1919–23, when he played a dominant part in the reconstruction of the Middle East and was prominent at many conferences after the first world war.

Cuthbert, St. (635–687), a famous monk who became prior of Melrose, and afterwards of Lindisfarne. For a time he lived in seclusion on one of the Farne Islands, but from 684 was Bishop of Hexham.

Cuvier, Georges Léopold, Baron (1769–1832), a French naturalist who founded a system of classification in zoology, and originated the science of comparative anatomy.

Cuyp, Albert (1620–1691), a famous Dutch landscape painter, several of whose works are in our National Gallery.

Cyprian, St., was an eminent ecclesiastic of the 3rd century, who wrote several notable treatises on matters of Christian doctrine. He was beheaded in 258, at an advanced age, and the present English calendar commemorates him on Sept. 26.

Cyrus the Great (d. 529 B.C.), the founder of the Persian Empire who by his conquests of Media, Lydia, and Babylonia, made himself master of Asia Minor. He was a great warrior and a wise ruler and figures prominently in the Bible. He was slain in battle on the river Jaxartes.

D

Daguerre, Louis Jacques Mandé (1789–1851), a French artist, who acquired fame as the inventor of the earliest photographic process, and then devoted himself to scene-painting and became part-proprietor of the Diorama in Paris.

Daimler, Gottlieb (1834–1890), German inventor with N. A. Otto of Cologne of the Otto gas engine, and in his later years eminent as the inventor of the motor-car that is named after him.

Dale, Sir Henry Hallett, O.M., G.B.E., F.R.S., M.D., D.Sc., LL.D., F.R.C.P. (b. 1875). President, British Association, 1947, and of the Royal Society, 1940–45. Chairman of the Lister Institute of Preventive Medicine, 1942. Awarded Nobel Prize for Medicine, 1936.

Dalhousie, 1st Marquess of, P.C., K.T. (1812–1860). The tenth Earl and first Marquess of Dalhousie was one of the most famous of India's Governors-General. He controlled the affairs of India during a period of great difficulty, and annexed the Punjab after the second Sikh War; later on also annexing Nagpur Jhansi, Pegu and other States. He left India in 1856, and the following year the Mutiny broke out.

Dalton, John (1766–1844), famous chemist and mathematician, renowned for his work on the construction of matter. In 1810 published his *New System of Chemical Philosophy*, in which the atomic theory was first propounded.

Damieu, Father (Joseph de Veuster) (1840–1889), a Belgian missionary who, going out to Honolulu in 1864, and witnessing the terrible sufferings of the lepers confined on the Island of Molokai, obtained permission to take spiritual charge of the Government settlement, and remained there working nobly for this wretched community, until in 1889 he himself was stricken with leprosy and died.

Damocles, the flatterer and favourite of Dionysius of Syracuse. The legend related by Cicero concerning him is that one day after expressing envy of Dionysius, he was invited to a banquet, where he found himself sitting beneath a naked sword suspended by a single hair. Hence the familiar simile "the sword of Damocles." The incident is referred to as of the first half of the 4th century B.C.

Damrosch, Walter Johannes (1862–1950), American musician, active in the musical development of the United States. Conductor of the New York Symphony Society, 1885–1927, and composer of three operas and of incidental music to Greek plays.

Dane, Clemence, C.B.E. (Winifred Ashton), author of *Regiment of Women*, *A Bill of Divorcement*, and *Will Shakespeare*, amongst many successful novels and plays.

D'Annunzio, Gabriele (1863–1938), Italian poet, dramatist and novelist. In Sept. 1919 he led an unofficial raid on Fiume and seized the port and town; when the Treaty of Rapallo was signed in 1920, he refused to recognise the Treaty, and declared war against Italy. Fiume was attacked and D'Annunzio, after a short resistance, surrendered.

Dante Alighieri (1265–1321), the greatest Italian poet and one of the great figures of world literature, was born in Florence in a period of political upheaval caused by the strife between Guelph and Ghibelline, which had divided mediaeval Italy for over a century. Though he saw her but once or twice, he conceived an abiding love for a Florentine lady, Bice Portinari (called by Dante Beatrice), wife of Simone di Bardi, whom he first met in 1274. She died in 1290. Some of his finest work was written after he was driven from his native city in 1301. His works include the *Vita Nuova* (written 1292–93 in memory of Beatrice), his supreme masterpiece the *Divine Comedy*, begun 1308–9 and completed shortly before his death, many beautiful lyrics, and some Latin treatises.

Danton, Georges Jacques (1759–1794), a famous member of the National Convention at the period of the first French Revolution. Was made President of the Committee of Public Safety, but Robespierre attacked and supplanted him. Danton was consigned to the guillotine shortly afterwards.

D'Arblay, Madame (1752–1840), better known as Frances (Fanny) Burney, daughter of the organist Dr. Charles Burney, made a great sensation while quite young and unmarried by her novel *Evelina*, which opened the doors of Society to her and gained her the friendship of Dr. Johnson.

Darius was the name borne by three Persian kings. The first reigned from 521 to 485 B.C., and was defeated by the Greeks at Marathon. The second was a natural son of Artaxerxes Longimanus, and having obtained the crown by the murder of his brother, reigned from 424 to 405 B.C. The third Darius was the last of the Persian kings, reigning only from 336 to 331 B.C. when Alexander the Great invaded his kingdom and defeated him in two great battles. Soon after he was assassinated.

Darling, Grace Horsley (1815–1842), English heroine who by putting off in a small boat from the lighthouse on one of the Farne Islands, of which her father was keeper, saved the shipwrecked crew of the *Forfarshire*.

Darnley, Earl of (1545–1567), was married to Mary Queen of Scots—as her second husband—in 1565. Two years later, after Mary had entered into an intrigue with Bothwell, he was murdered.

Darwin, Charles Robert, F.R.S. (1809–1882), the distinguished scientist, whose *Origin of Species* first clearly formulated and elaborated the theory of evolution. His first work (1837) described a five years' cruise in the *Beagle*, which the Government had sent out for scientific purposes. His *Origin of Species* appeared in 1859, and, though defended and supported by the scientific thought of the time generally, was much attacked by theologians. In 1871 Darwin issued his *Descent of Man*, a still further elaboration of the evolution theory. His other principal works were *The Expression Of Emotion in Man and Animals* (1872), *Insectivorous Plants* (1875), *Different Forms of Flowers* (1877), and *Worms* (1881). He was buried in Westminster Abbey.

Daudet, Alphonse (1840–1897), the celebrated French humorist and novelist, all of whose works have been translated into English.

Davenant, Sir William (1606–1668), a dramatist and poet of much note in his time, who filled the office of Poet Laureate in succession to Ben Jonson. He was buried in Westminster Abbey.

David I. (1084–1153) was King of Scotland and uncle of Matilda, daughter of Henry I.; he took up arms against Stephen on his repudiation of Matilda's claims to the English crown.

David II. (1324–1371), King of Scotland from 1330 to 1370. He was the son of Robert Bruce, and

in conflict with the English Army at Neville's Cross, in 1346, was defeated and made prisoner by Queen Philippa.

David, Sir (Tannatt William) Edgeworth, K.B.E., C.M.G., D.S.O., F.R.S. (1858–1934), an Australian geologist of the first rank, who was Professor of Geology at Sydney University 1891–1924. Spent much of his time in exploration, and accompanied as geologist Shackleton's Antarctic Expedition, 1907–9, leading the party that ascended Mt. Erebus, and discovering with Sir Douglas Mawson the South Magnetic Pole.

David, Jacques-Louis (1748–1825), a celebrated French painter of classic subjects, who put his art at the service of the New Republic.

David, St., patron saint of Wales, whose festival falls on March 1st, lived in the 6th century in Wales, and founded various monasteries.

Davidson, Randall Thomas Davidson, 1st and only Baron, P.C., G.C.V.O. (1848–1930), Archbishop of Canterbury, 1903–1928. Dean of Windsor, 1883–1891; Bishop of Rochester, 1891–1895; and Bishop of Winchester, 1895–1903. Was for a long period Domestic Chaplain and Clerk of the Closet to Queen Victoria, and married in 1878 the daughter of Archbishop Tait.

Davies, Rt. Hon. Clement, Q.C., M.P., (b. 1884), lawyer and politician. Called to the Bar, 1909, took silk, 1926. He led the Liberal Party from 1945 until 1956, and has represented Montgomery since 1929.

Davies, Sir (Henry) Walford, K.C.V.O., O.B.E., Mus.D., D.Mus. (1869–1941), Master of the King's Music, 1934–41; Director of Music and Chairman of the National Council of Music, University of Wales, 1919–41, the Gresham Prof. of Music, 1924–41.

Davies, William Henry (1871–1940), was a Welsh poet who spent his early life as a tramp and odd-job man. For six years he wandered about America, where he lost a foot "train-jumping," and for eight years followed a similar life in England, tramping, peddling and stopping in common lodging-houses. His poems reveal an intimate knowledge of and love for Nature. An account of his life is given in his *Autobiography of a Super Tramp.*

Da Vinci. *See* **Leonardo.**

Davis, Jefferson (1808–1889), an American statesman, who on the breaking out of Civil War, was made President of the Confederate States After the war he was a prisoner in the hands of the Federals, put on his trial for treason, and subjected to much indignity, but was ultimately discharged and wrote (1881) *The Rise and Fall of the Confederate Government.*

Davis, John (*c.* 1550–1605), one of the great Elizabethan explorers and discoverer of Davis's Strait, the channel between the Atlantic and Arctic Oceans on the west of Greenland. Invented the backstaff, or Davis's quadrant.

Davitt, Michael (1846–1906), after a hard-working and precarious bringing up this ardent Irish Nationalist attracted much notice by the bitter speeches he made on behalf of the Fenian Brotherhood, and in 1870 was sentenced to fifteen years' penal servitude for treason-felony, but was released on ticket of leave in 1877. Was one of the founders of the Irish Land League 1879. In 1881 was sent back to penal servitude, but released again in the following year. Was elected to Parliament while a prisoner at Portland but disqualified. Succeeded in entering Parliament in 1892, and resigned in 1899.

Davy, Sir Humphry, Bt., F.R.S. (1778–1829), the inventor of the safety-lamp. Was an eminent chemist whose researches and discoveries were of great scientific importance. Was the first to employ the electric current in chemical decomposition and discovered that nitrous oxide was perfectly respirable.

Dawber, Sir (Edward) Guy, R.A. (1861–1938), English architect. As Chairman of the Council for the Preservation of Rural England, he did much to bring about the restoration of buildings throughout the country.

Dawson, (George) Geoffrey (1874–1944), editor of *The Times*, 1912–19, and 1923–41; educated at Eton and Oxford; was private secretary to Lord Milner in S. Africa, 1901–5, editor of the *Johannesburg Star*, 1905–10.

Dawson, Peter (b. 1882), British singer, born in Adelaide, South Australia, and the possessor of a magnificent baritone voice.

Deakin, Rt. Hon. Arthur, C.H., C.B.E., J.P. (1890–1955), Trade Union leader; succeeded Ernest Bevin as general secretary of the Transport and General Workers' Union in 1949 and like him was a master negotiator.

Debussy, Claude Achille (1862–1918), composer and founder of the French Impressionist School in music. Among his works are *Suite bergamasque*, containing the popular *Clair de lune*, *L'après-midi d'un Faune*, inspired by the poem of Mallarmé, and *La Mer.* He also wrote an opera *Pelléas et Mélisande* based on Maeterlinck's drama. Biography by Edward Lockspeiser (1937).

Defoe, Daniel (1660–1731), the son of a London butcher. He became a political writer and novelist, obtaining world-wide fame by his *Robinson Crusoe*, written when he was nearly sixty years of age. This was followed by several other novels, all of great merit.

De Forest, Lee (b. 1873), American inventor who was the first to use alternating-current transmission, improved the thermionic valve detector and amplifier, which revolutionised wireless and by which modern wireless and sound films (Talkies) were made possible. He designed the first high-power station for the United States Navy and has been granted over 300 patents.

De Gasperi, Alcide (1881–1954), Italian catholic politician. Founded the Christian Democrat Party and worked for European federation. Died on eve of breakdown of Brussels Conference on E.D.C. Prime Min. 1945–53.

De Gaulle, Gen. Charles André Joseph Marie, *See* **Gaulle.**

De Havilland, Sir Geoffrey, C.B.E., F.R.Ae.A. (b. 1882), a pioneer of civil and military aviation. Began flying in 1908 and was the founder of the Stag Lane Aerodrome at Hendon and the designer of the famous Moth machines. Contributed in great measure to the advance of civil aviation since the first world war. Awarded the Guggenheim Medal in 1952. His son was killed in 1946 while testing a plane in preparation for breaking world speed record.

Delacroix, Ferdinand Victor Eugène (1798–1863), French painter of great imaginative and dramatic force, of the romantic school.

De la Mare, Walter John, O.M., C.H. (1873–1956), English poet and novelist whose work has a characteristic charm. Much of it was written for children.

Delane, John Thadeus (1817–1879), the famous editor of *The Times*, who, though he did not write himself, made his paper the greatest journal in the world. He occupied the editorial chair from 1841 to 1877.

Delaroche, Paul (Hippolyte) (1797–1856), an eminent French historical painter.

Delibes, Clément Philibert Léo (1836–91), French composer of much graceful music, including several operas, of which *Lakmé* is the most famous, and ballets, among them *Coppélia.*

Delius, Frederick, C.H. (1862–1934), English composer of German parentage. Studied at Leipzig from 1886 to 1888 where his suite *Florida* was first performed. In 1899 he went to live near Paris but became crippled and blind in his later years. Highly idiosyncratic in idiom, his music was more readily received in Germany than England until Sir Thomas Beecham's inspired performances won popularity for him in his native land. He composed operas, including *A Village Romeo and Juliet*, choral works, including *Sea Drift*, orchestral pieces, of which *On Hearing the First Cuckoo in Spring* is well known, besides chamber music, concertos, and songs.

Democritus (*c.* 460–357 B.C.), the Greek philosopher to whom the conception of the atomic theory is attributed. His cheerful disposition led to his being styled "the laughing philosopher," and the tradition tells that he put out his eyes in order not to be distracted in his speculations.

Demosthenes (385–322 B.C.), the famous Greek orator, statesman and warrior who, by his *Philippics*, roused the Athenians to resist the growing power of Philip of Macedon. Sixty-

one of his orations were preserved, and are regarded as the finest examples of their kind.

De Quincey, Thomas (1785–1859), an eminent essayist and critic, the friend of Coleridge, Wordsworth, and Southey. His *Confessions of an Opium-eater* is a British classic.

De Reszke, Jean (1853–1925) and **De Reszke, Edouard** (1856–1917), Polish operatic singers, the first a tenor, the second a baritone, who achieved fame and fortune by their singing.

Derwentwater, 3rd Earl of (1689–1716), the leader of the English Jacobite movement for placing the Pretender on the English throne. The rising took place in 1715, but was completely crushed by the Battle of Preston, and Derwentwater was beheaded.

Descartes, René (1596–1650), the famous French philosopher, mathematician, and author. Unconvinced by scholastic tradition and theological dogma, he sought to get back to primary truth, to the very definition of knowledge or the reason why anything can be said to be true. The basis of his Cartesian philosophy is summed up in his own words *cogito, ergo sum* (I am thinking so I exist).

Desmoulins, Lucie Simplice Camille Benoist (1760–1794), was one of the fiercest of the French Revolutionary leaders, and from the destruction of the Bastille to the early days of the Terror was unflagging in his onslaughts upon the aristocrats and the priesthood. He fell under the displeasure of Robespierre, however, and was sent to the guillotine along with Danton.

De Valera, Eamon, LL.D. (b. New York, 1882), Pres. Rep. of Ireland, 1959– ; leader of the Fianna Fail Party; Prime Minister 1938–48, 1951–54, and 1957–59; Minister for External Affairs 1932–48. Pres. of Executive Council of Irish Free State, 1932–38; Pres. of Sinn Fein 1917–26 when Fianna Fail was founded; Delegate to Assembly and Council of League of Nations, 1932, and President thereof 1932 and 1938.

De Valois, Dame, Ninette, D.B.E. (b. 1898), Irish-born ballet dancer and choreographer. Between world wars had many triumphs as a dancer with the British National Opera company and with the Diaghilev Russian ballet. Director of the Royal Ballet School (formerly the Sadler's Wells School).

Dewar, Sir James, F.R.S. (1842–1923), physicist and chemist, a native of Kincardine. From 1875 until his death Jacksonian Prof. of Natural Philosophy at Cambridge and from 1877 Fullerian Prof. of Chemistry at the Royal Institution. Famous for his work on the liquefaction of gases and his invention of the Thermos flask. Invented, with Sir F. Abel, the explosive cordite.

Dewey, Prof. John (1859–1952), the eminent American philosopher, psychologist and educationist, who, after holding professorships at the Universities of Minnesota, Michigan, and Chicago, where he was also Director of the School of Education until 1904, was Prof. of Philosophy at Columbia University, New York, 1904–32. A follower of William James, he became well known in America as an adherent of pragmatism.

De Witt, Jan (1625–72), Dutch republican statesman, who carried on war with England and later negotiated the Triple Alliance, but was overthrown by the Orange Party and murdered.

Diaghilev, Sergei Pavlovich (1872–1929), Russian ballet impresario and founder of the Russian ballet, who selected the best dancers, musicians, and artists in his productions. Among those associated with him were Anna Pavlova, Vaslav Nijinsky, Tamara Karsavina, Leonide Massine, Michel Fokine, the choreographer, L. N. Bakst, the painter, and Igor Stravinsky, the composer.

Dick, Sir William Reid, K.C.V.O., R.A., F.R.B.S. (b. 1879), British sculptor whose works include the Livingstone statue (Victoria Falls, Africa), memorial statue of King George V. at Westminster, and the statue of Pres. Roosevelt in Grosvenor Square.

Dickens, Charles (John Huffam) (1812–1870), the most popular novelist of the 19th century, who from very humble beginnings worked himself up to the highest position in the world of letters. His literary output was enormous. From the time of the publication of the *Pickwick Papers* down to his death in 1870, covering a period of 33 years, he produced novel after novel, all possessing the original Dickensian characteristics, yet each wonderfully different from the rest and his popularity continues undiminished. He did so much for the cultivation of the true sentiment of Christmas that, whenever that season comes round, his name is recalled with honour and homage. As a public reader of his own works Dickens evinced a marvellous dramatic gift. He was buried in Westminster Abbey.

Dickinson, Goldsworthy Lowes (1863–1932), English scholar, author and philosopher; an interpreter and upholder of the Greek view of life, which is the subject of many of his books.

Dicksee, Sir Francis Bernard, R.A. (1853–1928), well known as the painter of numerous pictures, including "Harmony," "Romeo and Juliet," and "The Funeral of a Viking."

Diderot, Denis (1713–1784), the famous French philosopher and editor of the *Dictionnaire Encyclopédique*, which occupied him thirty years.

Diefenbaker, Rt. Hon. John George, M.A., Q.C. (b. 1895), Canadian lawyer and leader of the Canadian Progressive Conservative Party; Prime Min., 1957– .

Diemen, Anthony van (1593–1645), Dutch Admiral who was Governor-General of the East Indian Colonies, 1636–45. He extended Dutch influence and trade throughout the Far East, promoted explorations to Australia, 1636–42, and on one of such explorations, Abel Tasman discovered New Zealand and named the island which we now know as Tasmania, Van Diemen's Land.

Diesel, Rudolf (1858–1913), German engineer, inventor of an internal-combustion engine which he patented in 1893. The modern so-called Diesel engine represents the improvements achieved by many men and has evolved mainly from the invention of Herbert Akroyd-Stuart, patented in 1890.

Diocletian (Caius Aurelius Valerius Diocletianus) (245–313), Roman Emperor (284–305). Inaugurated the system of partnership emperors, whereby the Empire was divided into four sections (the famous tetrachy), administered by himself in the East, Maximian in Italy and Africa, Constantius in Britain, Gaul, etc., and Gallerius in Illyricum. Ruthlessly persecuted the Christians.

Diogenes (412–322 B.C.), the celebrated Greek cynic philosopher who is said to have lived in a tub wearing the coarsest clothing and living on the plainest food. Many of his sayings have been preserved.

Dionysius. Two of the tyrants of Syracuse bore this name. The first was a great soldier and statesman as well as a poet and philosopher, and lived from *c.* 430–367 B.C. The second Dionysius was his son and successor, but was of such a cruel disposition that he was driven from the throne and died in obscurity in 343.

Disney, Walter Elias ("Walt") (b. 1901), American cartoonist; creator of Mickey Mouse, Silly Symphonies, Donald Duck Cartoons, and Pinocchio shown on the screen.

Disraeli, Benjamin. (*See* Beaconsfield).

D'Israeli, Isaac (1766–1848), the father of Benjamin Disraeli. Was an interesting worker in a special literary field, and produced some exceedingly interesting volumes dealing with authors and their writings. His best-known work is his *Curiosities of Literature.*

Dixon, Harold Bailey (1852–1930), Professor of Chemistry at Manchester University, 1887–1922, whose work on gaseous explosions opened a new era in combustion research.

Dobson, Frank, C.B.E., A.R.A., A.R.B.S. (b. 1888), a leading English sculptor. President of the London Group, 1923–27.

Dobson, Henry Austin, LL.D. (1840–1921), a Civil Servant from 1860 to 1901, he was the author of several volumes of Society verse and prose works, dealing chiefly with the 18th century.

Dodd, Francis, R.A., R.W.S. (1874–1949), painter, engraver and draughtsman. He was one of the official artists during the War of 1914–18, and executed a valuable series of portraits of British Admirals and Generals on active service. Appointed one of the official artists for the second world war, 1939–45.

Dodgson, Charles Lutwidge (1832–1898), a writer and mathematical lecturer at Christ Church,

Oxford, who, under the pseudonym of Lewis Carroll, achieved lasting fame by his *Alice's Adventures in Wonderland*, one of the most delightful books for children ever written.

Dolci, Carlo (1616–1686), the famous Florentine painter, examples of whose Madonnas and Saints are to be found in most National collections.

Dolci, Danilo (b. 1925), Italian architect who since 1952 has dedicated himself to the rehabilitation of the people of Sicily in their desperate poverty. He began with no resources but his own humanity, but now his work—agricultural, educational, and social—is inspiring world-wide interest.

Dominic, St. (1170–1221), founder of the Order of Dominicans, or Black Friars, who devoted much energy to the conversion of the Albigenses, but meeting with small success, instituted a policy of persecution after the manner of the later Inquisition.

Domitian (Titus Flavius Domitianus) (A.D. 51–96), Roman Emperor, son of Vespasian, who after many cruel and tyrannical acts aroused the enmity of the people and was assassinated.

Donatello (Donato di Niccolò di Betto Bardi) (1386–1466) the famous Italian sculptor, whose works are to be seen chiefly at Florence, though several examples are at South Kensington.

Donizetti, Gaetano (1797–1848), Italian operatic composer. Most popular of his sixty operas are *Lucrezia Borgia*, *Lucia di Lammermoor*, *La Fille du régiment*, *La Favorita*,and *Don Pasquale*.

Donne, John (1573–1631), an English poet and divine. As a preacher he was celebrated in his lifetime but few of his poems were printed and it was not until the 20th century that he was universally recognised as one of the most original of English poets. His writings include *Songs and Sonnets*, *Satyres*, *Elegies*, *Problems and Paradoxes*, and the *Holy Sonnets*. He took orders in 1615 and was made dean of St. Paul's in 1621. Sir Edmund Gosse's *Life and Letters* appeared in 1899 and Sir Herbert Griersons' monumental edition of Donne's poetry in 1912.

Donoghue, Stephen ("Steve") (1884–1945), in his day a famous jockey. Rode the Derby Race winner six times, and established a new record by winning this classic event in three successive years, 1921–22–23.

Doré, Gustave (1833–1883), the well-known French artist, famous for his colossal scriptural paintings and his powerful illustrations to the works of Dante, Milton, and Tennyson.

Dostoievsky, Feodor Mikhailovitch (1821–1881), one of Russia's greatest novelists. Author of *Crime and Punishment Brothers Karamazov*, *The Idiot*, *The Possessed*, etc. Dostoievsky's novels are quite exceptional for their deep psychological insight, vision and marvellous tragic and analytic power, and have had a profound influence on modern European writers.

Douglas, Marshal of the R.A.F. Lord, G.C.B., M.C., D.F.C. (b. 1893), commanded Fighter Command, 1940–42, R.A.F. Middle East, 1943–44, and Coastal Command, 1944–45. C.-in-C. and Military Governor of British Zone of Germany, 1946–47. A Labour peer.

Douglas, Norman (1868–1952), novelist and writer of witty and elegant prose. A Scot, born in Austria, he made his home on the Mediterranean and was buried on Capri. Travel books include *Siren Land* (1910). *Fountains in the Sand* (1912), *Old Calabria* (1915), *Alone* (1921), *Together* (1923); his highly entertaining novel *South Wind* was published in 1917.

Doulton, Sir Henry (1820–1897), famous potter and the inventor of Doulton ware.

Dowden, Edward, M.A., LL.D., D.C.L., Litt.D. (1843–1913). Well known for his critical and other writings, mainly dealing with the lives and works of the poets. Was Professor of Literature at Trinity College, Dublin, for 37 years

Dowding, Air Chief Marshal Lord, G.C.B., G.C.V.O., C.M.G. (b. 1882), Chief of Fighter Command in Battle of Britain, 1940.

Dowland, John (*c.* 1563–1626), English composer whose songs with lute accompaniment established him as the foremost lutanist of his day. His son Robert succeeded him as Court lutanist to Charles I.

Doyle, Sir Arthur Conan, M.D. (1859–1930), masterly writer of detective stories, the creator of Sherlock Holmes, the archetype of detectives, who shared a flat in Baker Street with his friend and chronicler, Dr. Watson, and conducted a long series of investigations. The immensely popular stories appeared in the *Strand Magazine* and include the *Hound of the Baskervilles* and the *Speckled Band*.

Doyle, Richard (1824–1883), an artist of much humour and fancy, who was exceedingly popular while on the staff of *Punch* from 1841 to 1850. The familiar cover of *Punch* is his work.

D'Oyly Carte, Richard (1844–1901), English theatrical manager, associated with the production of the Gilbert and Sullivan comic operas. The D'Oyly Carte Opera Companies played Gilbert and Sullivan all over the world.

Drake, Sir Francis (*c.* 1540–1596), the great admiral of Queen Elizabeth's time, who made many adventurous voyages, bent partly on discovery and partly on plunder. He was a leading figure—under Lord Howard—in the attack on and destruction of the Spanish Armada in 1588.

Draper, John William (1811–82), American chemist, b. near Liverpool, aided in the organisation of the medical school of New York university and became its professor of chemistry and physiology. He was the first to take a satisfactory photograph of the human face (1840).

Dreiser, Theodore (1871–1945), an American author whose novels of American life are written in vigorous native prose.

Dreyfus, Lt.-Col. Alfred (1859–1935), a French officer, condemned by a military secret tribunal on a charge of divulging secrets in 1894 to a foreign power, and condemned to imprisonment for life on Devil's Island in French Guiana. At a sensational new trial in 1899 he was again found guilty, and sentenced to a mitigated term of incarceration for ten years; but strenuous efforts on his behalf secured a pardon later. In 1906 he was entirely exonerated and reinstated in the army, with the rank of Major, and made a Chevalier of the Legion of Honour.

Drinkwater, John (1882–1937), was a well-known dramatist and poet. His plays *Abraham Lincoln* and *Oliver Cromwell* have had great praise and success.

Driver, Samuel Rolles (1846–1914) a distinguished Hebrew and Old Testament Scholar who was Regius Prof. of Hebrew at Oxford, 1883–1914. He was one of the greatest Hebrew scholars of his day, and was one of the higher critics of the Old Testament.

Drummond, William (1585–1649), a Scottish poet —laird of Hawthornden—whose works dealt largely with political matters, but revealed considerable poetic power. Ben Jonson walked from London to Scotland to pay him his respects.

Drury, (Edward) Alfred (Briscoe), R.A. (1857–1944). English sculptor who was responsible for may public monuments, including the colossal statues of Queen Victoria at Bradford and Portsmouth (1903), the decorations for the exterior of the War Office (1905) and of the Victoria and Albert Museum (1909).

Dryden, John (1631–1700), one of the most vigorous and prolific of English poets and writers, and a popular dramatist. He excelled in satire, and drew some powerful pictures of the statesmen of his day. His translation of Virgil ranks with Pope's translation of the *Iliad*. He was buried in Westminster Abbey. Originally a Parliamentarian he went over to the Royalists and was laureate and historiographer-royal, 1670–88.

Du Barry, Marie Jeanne Bécu, Comtesse (1746–1793), the favourite of Louis XV., who exercised great influence over the King, but after his death, and the breaking out of the Revolution, took refuge in England for a time. Being tempted to return to Paris in 1793, she was arrested and guillotined.

Du Chaillu, Paul Belloni (1835–1903), a noted African traveller who was chief of General Gordon's staff in 1874, and wrote many valuable books of travels, his studies of the gorilla being especially interesting.

Dufferin and Ava, 1st Marquess of, P.C., K.P., G.C.B., G.C.S.I., G.C.M.G., G.C.I.E., F.R.S. (1826–1902), was a diplomatist of great experience, a writer of brilliance, and filled many high offices with distinction and success, including those of Governor-General of Canada and Viceroy of India.

Duke-Elder, Sir William Stewart, K.C.V.O., M.A., D.Sc., M.D. (b. 1898), Scottish ophthalmic surgeon at several London Hospitals and Surgeon-Oculist to H.M. Queen Elizabeth.

Dulles, John Foster, (1888–1959), U.S. Secretary of State in the Republican Administration, 1953–59. In his foreign policy he encountered widespread criticism for his inflexible opposition to negotiation with Russia and U.S. recognition of China.

Dumas, Alexandre (1802–1870), French novelist and dramatist, who published more volumes than any man of his time. In the field of historical romance he showed wonderful power and resource and his thrilling story *Monte Cristo* is one of the great novels of the nineteenth century. He also wrote *The Three Musketeers.*

Dumas, Alexandre, Fils (1824–1895), French dramatist and novelist, son of the last-named, author of *La Dame aux Camélias.*

Du Maurier, George Louis Palmella Busson (1834–1896), one of the best known of the *Punch* artists during a long period and author of the novels of *Peter Ibbetson, Trilby,* and *The Martian.*

Dundee, John Graham of Claverhouse, 1st Viscount (1648–89), known as "Bonnie Dundee," royalist leader employed in the supression of the Covenanters, taking part in the defeat at Drumclog and the victory of Bothwell Brig under the Duke of Monmouth in 1679. Defeated Mackay in the pass of Killiecrankie but was killed in the moment of victory.

Duns Scotus, Johannes (1266–1308), a famous scholastic who was born at Maxton, in the county of Roxburgh; joined the Franciscan Order at Dumfries in 1281, and ordained priest at Lincoln in 1291. Student and teacher at Oxford and Paris and died at Cologne. He was the great doctrinal opponent of Thomas Aquinas and has been surnamed *doctor subtilis.*

Dunsany, 18th Baron (b. 1878), Irish dramatist and author. He has written a number of colourful, whimsical and deeply imaginative novels, as well as short stories, and plays.

Dunstan, Saint (909–988), the famous Abbot of Glastonbury and Archbishop of Canterbury, who lived through seven reigns from Ethelstan to Ethelred and exercised great political influence.

Dupleix, Joseph François (1697–1763), was governor of the French East Indian possessions at the time when Clive was guiding the fortunes of the East India Company, and after Clive's victory at Plassey Dupleix's day was over. He returned to France, and fell into disgrace and poverty.

Dürer, Albrecht (1471–1528), the great German painter and engraver, and friend of Luther. Many of his engravings are in the British Museum. Of Nuremberg birth, he may be regarded as the founder of the German school and the inventor of etching.

Durham, John George Lambton, Earl of (1792–1840), served as Governor-General of Canada after the disturbances of 1837, and in 1839 presented the famous *Durham Report* to Parliament. This laid down the principle of colonial self-government and marks a turning-point in the affairs of the Empire.

Duse, Elenora (1861–1924), an Italian tragedienne of world-wide reputation.

Duval, Claude (1643–1670), a notorious highwayman who, coming to England from Normandy in the Duchess of Richmond's service, took to "the road," and for a few years successfully evaded capture. He was hanged at Tyburn.

Duveen, 1st and only Baron, of Millbank (1869–1939), was head of a firm of noted art dealers, and a generous benefactor to British Art.

Dvorák, Antonin (1844–1904), Czech composer whose music is rich in the folk-song melodies of his native Bohemia and has a characteristic lilt and harmony. In 1884 he conducted his *Stabat Mater* in London, where this cantata and his *Slavonic Dances* were very popular. Composed his *From the New World* symphony in New York where he was head of the National Conservatoire (1892–94). He wrote 9 symphonies besides much orchestral and chamber work, piano pieces, songs, and operas.

Dyson, Sir Frank (Watson), K.B.E., F.R.S. (1868–1939), Astronomer Royal (1910–33). Was previously (1905–10) Astronomer Royal for Scotland. Was the author of a number of works on astronomy, and widely celebrated for his interesting public lectures.

Dyson, Sir George, K.C.V.O., M.A., Mus.D., LL.D., F.R.C.M. (b. 1883), Director of the Royal College of Music 1938–53. Author of *The New Music,* in which he analyses the technique of modern schools of composition. Composed a symphony, a violin concerto, and several choral works such as *The Canterbury Pilgrims* and *Nebuchadnezzar.*

E

Eastlake, Sir Charles Lock, P.R.A. (1793–1865), an eminent English painter whose works were mostly of a religious character. Pres. of R.A. 1850.

Eastman, George (1854–1932), American inventor who invented the roll photographic film and the famous Kodak camera. He amassed a vast fortune and his philanthropies were estimated at over £60 million. After a long illness he committed suicide.

Eck, Johann von (1486–1543), one of the most vigorous opponents of the Reformation in Germany.

Eddington, Sir Arthur Stanley, O.M., F.R.S. (1882–1944), Plumian Professor of Astronomy, Cambridge, 1913; Director of the Cambridge Observatory, 1914–44. Author of *The Nature of the Physical World* (1928) and many scientific works.

Eddy, Mrs. Mary Baker (1821–1910), founder of the religion (theology and practice) which she named Christian Science, and of the Church of Christ, Scientist. Author of the Christian Science textbook, *Science and Health with Key to the Scriptures,* published in 1875.

Ede, Rt. Hon. James Chuter, C.H., M.P. (b. 1882), Home Secretary in two Labour Governments, 1945–51. Parliamentary Secretary to the Ministry of Education, 1940–45.

Eden, Rt. Hon. Sir (Robert) Anthony, K.G., M.C., (b. 1897), succeeded Sir Winston Churchill as Prime Minister in April 1955. He had been Deputy Prime Minister and Foreign Secretary since 1951. First appointed Foreign Secretary in 1935 (the youngest to hold that office for over a century), but resigned in 1938 on a difference of policy with Mr. Neville Chamberlain about relations with Italy. Entered Parliament as a member for Leamington in 1923. He has many diplomatic achievements to his credit, though his Suez policy in 1956 divided the country. Resigned because of ill-health in Jan. 1957. His Memiors, *Full Circle,* pub. 1960.

Edgar (943–75), King of England 959–75, who under the influence of Dunstan was able to carry out many useful reforms.

Edgar Atheling (*c.* 1060–*c.* 1130), as grandson of Edmund Ironside, was the lawful heir of Edward the Confessor, but in the confusion of the Norman invasion he was unable to maintain his claim.

Edgeworth, Maria (1767–1849), Irish novelist, whose stories included *Castle Rackrent, The Absentee,* and *Belinda.*

Edinburgh, H.R.H. Prince Philip, Duke of, K.G., P.C., K.T., G.B.E. (b. 1921), consort of H.M. Queen Elizabeth II. Relinquished his title of Prince Philip of Greece and of Denmark on his naturalisation in 1947, taking the name of Mountbatten. He is the great grandson of Queen Victoria, grandson of Admiral Prince Louis of Battenburg, and nephew of Earl Mountbatten of Burma. Educated in England and Germany and at the Royal Naval College. Served in the Royal Navy throughout the war. Pres. of the National Playing Fields Association; Pres. of the British Association, 1951–52. Chancellor of Edinburgh University, 1953.

Edison, Thomas Alva (1847–1931), an American inventor, who after an adventurous boyhood became a telegraph operator and interested in electrical problems. Established himself in New York in 1869, and invented an improved printing telegraph. In 1867 set up an elaborate laboratory and factory at Memlo Park, New Jersey, from which place he sent out many clever and some startling inventions, including a system of duplex telegraphy, afterwards im-

proved into quadruplex and sextuplex transmission, the phonograph, and a method of preparing carbon filaments for the electric lamp; patented over 1300 inventions.

Edmund II. (**Ironside**) (980–1016), the son of Ethelred, after years of contention with the Danes, made a compact with Canute to divide England between them, but dying shortly afterwards the kingdom was settled on Canute.

Edward the Confessor (*c.* 1004–1066), the Anglo-Saxon king who immediately preceded—save for the brief reign of Harold of less than a year—the Norman Conquest, and founded Westminster Abbey, where a smaller church, then dilapidated, had previously for a period had a precarious existence. He was a religious-minded mystic, and was canonised in 1161, and given the shrine in the Abbey of his origination, which yet remains fairly intact, despite the ravages of time and disturbing hands.

Edward the Elder was the son of Alfred, and succeeded him as King of the West Saxons in 899. He was successful in overcoming the Danes, and became overlord of the Northern counties.

Edward the Martyr (963–979) became king in succession to Edgar, but, although supported by Dunstan, was not able to prevail against his stepmother Elfrida, who had him murdered.

Edward I. (1239–1307) was king of England from 1272 to 1307. Took part in the Crusades, completed the conquest of Wales, overcame Scottish opposition—executing Wallace and receiving the submission of Bruce, and promulgated many wise laws. He was nicknamed "Longshanks."

Edward II. (1284–1327), the son of Edward I. succeeded his father when the latter died at Burgh-over-Sands in 1307. Suffered defeat at the hands of the Scots at Bannockburn, and on account of his arbitrary disposition, cruelty and lavish concessions to favourites, was deposed in 1327, and afterwards murdered at Berkeley Castle.

Edward III. (1312–1377) was one of the ablest of English monarchs who, although much taken up with long and bitter wars with France and Scotland, did much for the commercial interests of the nation, and was the means of introducing large numbers of Flemings into the country, who laid the foundation of the English textile manufacturers. He married Philippa of Hainault, and was the father of Edward the Black Prince.

Edward IV. (1442–1483) attempted unsuccessfully to regain the lost English possessions in France, and resorted to many despotic expedients for obtaining supplies but it stands to his credit that he entered into trading treaties with the commercial merchants of the Continent which were of benefit to his people.

Edward V. (1470–1483)—son of Edward IV. and Elizabeth Woodville—was the unfortunate king who was put to death in the Tower of London, and succeeded by Richard III., his unscrupulous uncle, who had made himself "Protector" and assumed the Crown a little more than two months after the death of Edward IV., publishing the demise of the young King and his brother the Duke of York as having occurred in prison. The bones of the murdered boys were many years afterwards taken to Westminster Abbey for final burial.

Edward VI. (1537–1553), succeeded his father, Henry VIII., when in his tenth year and died in his sixteenth year. The Reformation under the Regency of Somerset first, and then of Northumberland, made considerable progress during his brief reign. He was induced during his last illness to name Lady Jane Grey his successor, with results disastrous to that unfortunate personage and many others concerned.

Edward VII. (1841–1910). Was married to Princess Alexandra of Denmark in 1863. Visited India in 1875, and from that time onward was constantly in the public eye, taking part in all kinds of functions. Succeeded to the throne on the death of Queen Victoria, Jan. 22, 1901. The Coronation, which had been planned for June 26, 1902, had to be postponed in consequence of the King's sudden illness, but eventually took place on August 9 in the same year. His Majesty was a powerful factor in the preservation of the peace of Europe, his friendly intercourse with the heads of the French, German, and other nations earning for him the title of "Edward the Peacemaker."

Edward VIII. (b. 1894), succeeded to the throne on the death of his father, George V., Jan. 20, 1936; Prince of Wales 1911–36. Abdicated in favour of his brother H.R.H. the Duke of York Dec. 10, 1936, and was created Duke of Windsor. Governor of the Bahamas 1940–45.

Edwin (585–633), King of Northumbria, killed in battle at Hatfield Chase, Yorkshire, in 633. He was baptised into the Christian faith at York in 627, and built a church there. He was canonised later.

Egbert was a descendant of Cerdic, king of the West Saxons, and reigned from 802 to 839 in Wessex; in his later years became the first king of all England. In 835 he had to drive the Northmen away from Cornwall.

Ehrlich, Paul (1854–1914), a noted German scientist who was Director of the Royal Institute for Experimental Therapeutics at Frankfurt-on-Main, which he made famous by his experimental laboratory work in connection with cancer. His prolonged experimental researches brought him world-wide renown, his greatest triumphs being the discovery of salvarsan and neo-salvarsan. He received the Nobel Prize in 1908.

Eiffel, Alexandre Gustave (1832–1923). French engineer, one of the first to employ compressed-air caissons in bridge building. Among his notable works are the great Eiffel Tower, Paris (1887–89) and the Panama Canal Locks.

Einstein, Albert (1879–1955), one of the greatest men of science of all time, whose chief claim to fame rests upon his theories of relativity. He was born in Ulm of Jewish parents and lived for many years in Switzerland. Awarded the Nobel Prize in 1922 for his work in quantum theory. In 1933 he was driven by the Nazis to seek asylum in America and became a professor at the Institute for Advanced Study at Princeton, 1933–45. His works include *Relativity* (1920), *Zur Einheitlichen Feldtheorie* (1929), *About Zionism* (1930), *The Evolution of Physics* (1938), *The Meaning of Relativity* (1950), *Out of My Later Years* (1950).

Eisenhower, Dwight David, G.C.B., O.M. (b. 1890), Pres. of United States since 1953 (re-elected Nov. 1956). Supreme Commander Atlantic Forces in Europe 1950–52. U.S. Chief of Staff, 1945–48. C.-in-C. Allied Forces, European theatre of operations, 1943–45, and of Allied Forces, N. Africa, 1942–43. Pres. of Columbia Univ., 1948–50. Retired from the army in June 1952.

Eisenstein, Sergei Mikhailovich (1898–1948), Russian film director, whose silent film classic *The Battleship Potemkin* brought him world-wide fame. He also produced *Alexander Nevsky* and *Ivan the Terrible*.

Eleanor, Queen of Edward I. (d. 1290), was a woman of great piety and devotion. After her death the king had memorial crosses erected at the twelve places where her body rested on its way from Grantham to Westminster.

Elgar, Sir Edward, Bart., O.M., G.C.V.O. (1857–1934), English composer and Master of the King's Musick, 1924–34. Starting as a violinist and a teacher, he composed many choral-orchestral works for various festivals and sprang to fame with the *Enigma Variations*, musical portraits of his friends. Other compositions include two symphonies, the oratorios *The Kingdom*, *The Apostles* and *The Dream of Gerontius* and the tone-poem *Falstaff*.

Elgin, Thomas Bruce, 7th Earl of, P.C. (1766–1841), a British diplomatist who brought to England from Athens the famous "Elgin marbles," now in the British Museum.

Eliot, George (1819–1880), the pen name of Marian Evans, who produced some of the most memorable novels of the 19th century, including *Adam Bede*, *The Mill on the Floss*, *Silas Marner*, *Middlemarch* and *Daniel Deronda*.

Eliot, Thomas Stearns, O.M. (b. 1888), one of the foremost lyric poets of the 20th century. Born in U.S.A. he became a naturalised British citizen in 1927. The poet of disillusionment, as he has been called, he made his name with his poem *The Waste Land* (1922), which was followed by *Poems* (1909–33), and by *Ash Wednesday* (1930). Author of *Murder in the Cathedral*, portraying the murder of Thomas à

Becket, *The Cocktail Party*, and *The Confidential Clerk*. Awarded Nobel Prize for Literature 1948.

Elizabeth (b. 1900), Queen Consort of George VI., daughter of the 14th Earl of Strathmore. Before her marriage in 1923 she was Lady Elizabeth Angela Marguerite Bowes-Lyon.

Elizabeth I. (1533–1603) came to the throne in 1558 at the age of twenty-five, and reigned forty-five years. Was a fervid Protestant, a sincere lover of her country, a masterful and enlightened ruler—fickle as far as her favourites were concerned—and added distinction to a distinguished period. The defeat of the Spanish Armada, the execution of Mary Stuart, the naval supremacy of England, the extension of her colonies, and the glory of a great new literature of which Shakespeare was the brightest ornament are features associated with her reign.

Elizabeth II. (**Elizabeth Alexandra Mary of Windsor**) (b. 1926), ascended the throne in February 1952 at the age of twenty-five on the death of her father George VI. Her Consort, Prince Philip, Duke of Edinburgh, is the son of Prince Andrew of Greece and a descendant of the Danish royal family. They have three children, Charles, Prince of Wales (b. 1948), Princess Anne (b. 1950) and Prince Andrew (b. 1960).

Ellis, (Henry) Havelock (1859–1939), literary and scientific writer and an authority on sex.

Elwes, Gervase Henry (1866–1921), a famous English tenor who excelled in his interpretation of the works of Vaughan Williams and Elgar.

Emerson, Ralph Waldo (1803–1882), the American essayist and philosopher. His *Conduct of Life*, *Representative Men*, and *Essays*, are among the most brilliant literary productions of America.

Emin Pasha, the name adopted by **Eduard Schnitzer** (1840–92), a German explorer associated with Gen. Charles Gordon in the pacification of the Sudan. He joined Gordon's forces as a medical officer and showing marked administrative ability was made governor of the Equatorial Province in 1878. He was menaced by the Mahdi and rescued by Stanley in 1889. While engaged in exploration for Germany in the region of Lake Tanganyika he was murdered by Arabs.

Emmet, Robert (1778–1803), the enthusiastic youth who led the rebellion in Ireland in 1803 and was tried and executed in the same year for high treason. He is one of Ireland's patriot heroes.

Empedocles (*c.* 500–*c.* 430 B.C.), Greek philosopher, b. Agrigentum in Sicily, founder of a school of medicine which regarded the heart as the seat of life, an idea which passed to Aristotle, as did his idea that all matter was composed of four elements: earth, air, fire, and water. He was also a poet.

Engels, Friedrich (1820–1895), Socialist writer and lifelong friend of Karl Marx with whom he collaborated in producing the Communist Manifesto of 1848.

Epictetus of Hierapolis, the Stoic philosopher, who lived in the 1st century, and was a moral teacher of great repute and influence.

Epicurus (342–270 B.C.), the founder of the Epicurean philosophy, which taught that virtue should be followed because it leads to happiness.

Epstein, Sir Jacob, K.B.E. (1880–1959), sculptor, born in New York of Russian–Polish parents. His work includes *Rima*, the Hudson memorial in Hyde Park; *Day* and *Night* on the building of the Underground Headquarters at St. James' Park; *Genesis*, exhibited in 1931; *Lazarus*, which has a fine setting in New College, Oxford; the *Madonna and Child* group for the restored 18th cent. buildings in Cavendish Square; the figure of *Christ in Majesty*, cast in aluminium, in Llandaff Cathedral; and a monumental sculpture for the T.U.C. headquarters in London.

Erasmus Desiderius (1466–1536), the great Dutch philosopher and scholar, of whom it was said that he "laid the egg which Luther hatched."

Ericsson, John (1803–1889), Swedish engineer who entered into competition with George Stephenson in the first famous trial of locomotives.

Ervine, St. John Greer (b. 1883), author, dramatist and critic, noted as an able controversialist on all subjects pertaining to the theatre.

Essex, Robert Devereux, 2nd Earl of (1567–1601), became Queen Elizabeth's favourite after the death of Leicester, but, offending the Queen by certain acts in Ireland, was committed to prison. Later he suffered death on Tower Hill.

Ethelbert, King of Kent at the close of the 6th century and commencement of the 7th. Famous for having accepted Christianity on the entreaty of St. Augustine. Published the first code of written laws in English. Canonised later.

Ethelred II. (*c.* 968–1016), became king of England on the murder of his half-brother, Edward the Martyr (978). He was an incompetent ruler and unable to organise resistance against the Danish raids. Called "the Unready" (from Old Eng. uræd = without counsel).

Ethelwulf was the Anglo-Saxon sovereign who succeeded his father Egbert in 837. Died in 857, and was buried at Winchester.

Etty, William (1787–1849), a famous English R.A., who contributed to the Royal Academy some of its most admired pictures between 1820 and 1849.

Eucken, Rudolf Christoph (1846–1926), a famous German philosopher and theologian.

Euclid (*c.* 330–*c.* 260 B.C.), illustrious Greek mathematician whose *Elements of Geometry* remained a standard text-book until the present century.

Euler, Leonhard (1707–83), Swiss mathematician, regarded as the founder of pure mathematics. He was called by Catherine I. to St. Petersburg, where he became Professor, 1730–41.

Euripides (480–406 B.C.) was the greatest of Greek tragic poets. He wrote seventy-five plays, eighteen of which have been preserved, the most famous being *Alcestis*, *Medea*, *Iphigenia*, and *Orestes*.

Eusebius (264–340), an ecclesiastical historian of rare industry, whose works are still held in great esteem. His *Chronicon* is a history of the world down to his own time, while his *Ecclesiastical History* traces the chief events of the Christian Church.

Evans, Sir Arthur John (1851–1941), distinguished archæologist, chiefly famed for his excavations at Knossos in Crete and his discovery of the pre-Phœnician script.

Evans, Dame Edith Mary, D.B.E. (b. 1888), the versatile and brilliant English actress who made her first appearance as Cressida in *Troilus and Cressida* in 1912. She has played many leading roles and has also appeared in films.

Evatt, Rt. Hon. Herbert Vere, M.A., LL.D. (b. 1894), Australian lawyer and politician; Min. for External Affairs 1941–49; leader of the Federal Labour opposition, 1951–60; Chief Justice, New South Wales, 1960.

Evelyn, John (1620–1706), was one of the founders of the Royal Society and wrote several scientific works, but is best remembered for his *Diary* which covers the period 1640–1706.

Eyck, Hubert van (*c.* 1366–1426), and **Eyck, Jan van** (*c.* 1386–1440), two of the greatest masters of the early Flemish School of Painters.

F

Fabius Maximus (Cunctator) (d. 203 B.C.), the Roman Consul and Dictator, saved Rome from conquest by Hannibal by deliberate and well-planned strategic evasion of battle. The term "Fabian Policy" is derived from Fabian's tactics.

Fabre, Jean Henri Casimir (1823–1915), French naturalist whose lifelong interest was the study of the habits of insects and whose observations were delightfully recorded in his *Souvenirs entomologiques*, a work of many volumes.

Faed, Thomas, R.A. (1826–1900), one of the most successful of Victorian painters, won a great reputation for his Scottish subjects.

Fahrenheit, Gabriel Daniel (1686–1736), German physicist, born in Danzig, improved construction of thermometers, notably in using quicksilver for alcohol. Devised the scale with freezing-point at 32° boiling-point at 212°.

Fairbairn, Sir William, 1st Bt., F.R.S. (1789–1874), mechanical engineer and inventor. By the first utilisation of iron in shipbuilding, became eminent and wealthy.

Fairfax, Thomas, 3rd Lord (1612–1671), a promi-

nent leader of the Parliamentary army during the Civil War, who greatly distinguished himself at Marston Moor and Naseby.

Falla, Manuel de (1876–1946), Spanish composer whose music is highly individual with a strong folk-song element. His compositions are relatively few and comprise 2 operas, 2 ballets (*The Three-Cornered Hat* was one of Diaghilev's greatest successes), piano music, pieces for piano and orchestra, songs, harpsichord concerto, and guitar solo in memory of his friend Debussy.

Faraday, Michael, F.R.S. (1791–1867), great experimental physicist, founder of the science of electro-magnetism. He was the son of a blacksmith and at the age of 12 worked for a bookbinder, to whom he was later apprenticed. Became laboratory assistant to Sir Humphry Davy at the Royal Institution in 1813, and in 1827 succeeded him, becoming professor of chemistry in 1833. He was one of the world's most brilliant experimenters and set himself the problem of finding the connections between the forces of light, heat, electricity, and magnetism. The epoch-making discoveries he made form the basis of the modern electrical industry. He lectured superbly well and inaugurated the Christmas lectures for juvenile audiences at the Royal Institution.

Farman, Henri (b. 1874), French aviator, one of the pioneers of aviation and a famous designer and builder of aeroplanes.

Farouk I (b. 1920), King of Egypt, 1936–52. Forced to abdicate as a result of a military *coup d'état* in July 1952.

Farrar, Very Rev. Frederic William, D.D., F.R.S. (1831–1903), Dean of Canterbury, 1895–1903; a divine and author, some of whose writings attained a large circulation and exercised a considerable influence. His most popular publications were *The Life of Christ*, *The Life and Works of St. Paul*, and *Early Days of Christianity*. Author of the schoolboy story *Eric*.

Fauré, Gabriel Urbain (1845–1924), French composer and teacher; pupil of Saint-Saëns. He was much revered by his pupils at the Paris Conservatoire, among whom was Ravel. His works include chamber music, nocturnes and barcarolles for piano, an opera *Pénélope*, some exquisite songs, and *Requiem*.

Fawcett, Rt. Hon. Henry (1833–84), was totally blinded in a shooting accident in 1858, but rose to Professor of Political Economy at Cambridge after the publication of his *Manual of Political Economy* in 1863. In 1865 he entered Parliament as a Liberal and in 1880 became Postmaster-General. Introduced the parcel-post, postal orders, and the 6*d*. telegram.

Fawcett, Dame Millicent Garrett, G.B.E. (1847–1929), widow of the above; educational reformer and leader of the movement for women's suffrage; a very able writer on political economy and one of the founders of Newnham College, Cambridge.

Fawkes, Guy (1570–1606), a Yorkshire Catholic, who with Catesby and other conspirators planned the Gunpowder Plot. Although warned of the discovery of the plot, Fawkes persisted and was captured in the cellar of the Parliament House and hanged. (*See* **Gunpowder Plot**, General Information section.)

Fénelon, François de Salignac de la Mothe (1651–1715), Archbishop of Cambrai and a writer of distinction. His *Telemachus* is a French classic.

Ferdinand V. of Aragon (1452–1516), who married Isabella of Castile, and with her reigned over Spain during a period of great events. He saw the Moors expelled from Spain, equipped Columbus for the discoveries which led to Spain's vast colonial possessions, and instituted the Inquisition.

Ferguson, James, F.R.S. (1710–1776), a Banffshire man of great ability and inventiveness, who, from being a shepherd-boy, educated himself in astronomy, mathematics, and portrait painting, so that he was able to support his parents, and became eminent as a scientific lecturer. He was made a Fellow of the Royal Society.

Fermi, Enrico (1901–54), Italian nuclear physicist whose research contributed to the harnessing of atomic energy and the development of the atomic bomb. Prof. of Physics at Rome, Columbia Univ., New York, and Univ. of Chicago. He postulated the existence of the neutrino and discovered the element Neptunium. Awarded the 1938 Nobel Prize in Physics.

Festing, Gen. Sir Francis Wogan, G.C.B., K.B.E., D.S.O. (b. 1902), succeeded Field-Marshal Sir Gerald Templer as Chief of Imperial General Staff in 1958. During the war he commanded the 36th Division in Burma.

Feuchtwanger, Dr. Lion (1884–1958), German-Jewish author famous for his historical novels, such as *Jew Süss* and *'Tis Folly to be Wise*, an essay about Jean-Jacques Rousseau, published in 1954.

fforde, Sir Arthur Frederick Brownlow, M.A. (b. 1900), British solicitor and educationist who became Chairman of the B.B.C. in 1957.

Fichte, Johann Gottlieb (1762–1814); was Professor of Philosophy, first at Jena and then at Erlangen, and later Rector of the University of Berlin. His works had great influence upon the thought of his time and prepared the way for the later Hegelian dialectic.

Field, John (1782–1837), composer and pianist, born in Dublin; pupil of Clementi and teacher of Glinka. At early age travelled Europe as virtuoso pianist. Composed seven concertos, three sonatas, and numerous piano pieces. Chopin's nocturnes were modelled on those of Field. The later part of his life was spent in Moscow, where he died.

Fielding, Henry (1707–1754), a celebrated English novelist, author of *Tom Jones*, *Joseph Andrews*, and *Amelia*, as well as many plays.

Fields, Gracie, C.B.E. (b. 1898), an inimitable Lancashire comedienne, and a great popular favourite with the British public. Made her first London appearance in 1915. Equally successful on the films as on the stage, she gained the affections of her music hall audiences through her abundant vitality, her Lancashire humour and her remarkably flexible voice.

Fildes, Sir Luke, K.C.V.O., R.A. (1844–1927), first attracted notice as a black-and-white artist, and illustrated Dickens' *Edwin Drood*. Exhibited at the Royal Academy in 1872, and at successive exhibitions was represented by many important works.

Finsen, Prof. Niels Ryberg (1860–1904), a Danish physician whose light-ray treatment of *lupus vulgaris* won the approval of Queen Alexander and the aid of many philanthropists. He established in Copenhagen an institute for light therapy. Inventor of the Finsen ultra-violet lamp. Awarded 1903 Nobel Prize for Medicine.

Firdousi, *nom de plume* of **Abdul Kasim Mansur** (*c.* 930–1020), Persian poet whose great epic *Shahnama*, or *Book of Kings*, relates the history of Persia in 60,000 verses.

Fisher, Most Rev. Geoffrey Francis, P.C., G.C.V.O., M.A., Hon. D.D. (b. 1887). Archbishop of Canterbury since 1945, the 99th holder of the office; Bishop of London, 1939–45; Bishop of Chester, 1932–39; Headmaster Repton School, 1914–32.

Fisher, Rt. Hon. Herbert Albert Laurens, O.M., F.R.S. (1865–1940), President of the Board of Education, 1916–22. His comprehensive *History of Europe* shows a vast range of knowledge and a great ability to generalise.

Fisher, Professor Sir Ronald Aylmer, Sc.D., F.R.S. (b. 1890), one of the greatest of British scientists who has revolutionised both genetics and the philosophy of experimentation by founding the modern corpus of mathematical statistics.

FitzGerald, Edward (1809–1883), English poet who gained world-wide fame by his translation of the *Rubaiyát* of Omar Khayyam (1859).

Fitzroy, Vice-Admiral Robert, F.R.S. (1805–1865). Attained celebrity as a meteorologist, and in 1854 was made superintendent of the Meteorological Department, and was the introducer of the system of storm warnings which were the beginning of weather forecasts.

Flammarion, Camille (1842–1925), French astronomer, famous for his observations on double stars, star-drift and popular lectures and books on astronomy. Founded the Astronomical Society of France in 1887. His best-known work is *L'Astronomie Populaire*.

Flamsteed, John, F.R.S. (1646–1719), was the first English Astronomer Royal, and a close friend of Sir Isaac Newton, whom he aided in many of his experiments.

Flaubert, Gustave (821–80), one of the greatest of French novelists and creator of *Madame Bovary* which took six years to write. His extraordinary perfection of style was attained only through incessant labour. He hated anything lax and was only satisfied when he had exactly expressed his meaning. Other works were *Salammbo*, *La Tentation de Saint-Antoine* and his drama *Le Candidat*.

Flaxman, John R.A. (1755–1826), a great English sculptor who was born at York, and at 20 was employed as modeller by Josiah Wedgwood. In 1787 he went to Rome, where he stayed 7 years. In 1800 he was elected R.A. and in 1810 became professor of sculptor to the Royal Academy.

Flecker, James Elroy (1884–1915), English poet who early showed signs of becoming one of the most notable poets of his generation, and lived to see his works recognised by the best critics of his time. His works include *Golden Journey to Samarkand*, *Hassan* (staged in London, 1923) and *Don Juan*, as well as many lyrics.

Fleming, Sir Alexander, F.R.S. (1881–1955), as a bacteriologist he made many original contributions, including the discovery of the antibacterial enzyme lysozyme in 1922 and penicillin in 1928. Full recognition of his discovery came only during the war, when Sir Howard Florey separated the drug now used for treatment from the original penicillin. Awarded Nobel Prize for Medicine jointly with Sir H. Florey and Dr. E. B. Chain, 1945. Retired as director of the Wright-Fleming Institute of Microbiology at St. Mary's Hospital, London, in 1954.

Fleming, Sir (John) Ambrose, F.R.S. (1849–1945), was the inventor of the thermionic valve which revolutionised wireless telegraphy and also made wireless telephony possible. Prof. of Electrical Engineering in University College, London, 1885–1926.

Fletcher, John (1579–1625), the famous collaborator with Beaumont in numerous plays which were popular in their day and take high position in the dramatic literature of the country.

Fleure, Prof. Herbert John, D.Sc., F.R.S. (b. 1877), British geographer and anthropologist who was Prof. of Geography at Manchester University 1930–44, and Prof. of Geography and Anthropology, University College of Wales, 1904–30.

Flinders, Matthew (1774–1814), an explorer and navigator, who made important discoveries in and around Australia. He sailed through Bass Strait, so called in honour of his surgeon.

Foch, Marshal Ferdinand, O.M. (1851–1929), Generalissimo commanding the Allied Forces in France from March 1917 until after the Armistice was signed, Nov. 11, 1918. Under his direction the great German offensive was checked and turned at the Marne in July 1918. He followed up this success with a series of rapid attacks culminating in the German surrender, Nov. 11, 1918, when he imposed the conditions of the Armistice.

Fokine, Michel (1880–1944), was the famous Russian dancer and Master of the original Russian Ballet, to whom the modern renascence of ballet may be largely attributed. A dominating figure in the world of ballet who became choreographer to Diaghilev's company.

Fokker, Anthony Herman Gerard (1800–1939), was a famous Dutch airman and aeronautical engineer, and designer and builder of the well-known Fokker military and commercial aeroplanes.

Fonteyn, Dame Margot (Mme. Roberto de Arias), D.B.E. (b. 1919), Prima ballerina of the Royal Ballet (formerly Sadler's Wells Ballet) and acclaimed as the foremost English dancer of to-day.

Forbes, (Joan) Rosita, F.R.G.S. (b. 1893), the well-known traveller and authoress. She has travelled and explored in Abyssinia, and crossed the Libyan desert in native costume in 1920.

Ford, Henry (1863–1947), founder of Ford Motor Co., 1903, of which he was President until 1919, when he was succeeded by his son, Edsel B. Ford (1893–1943). Henry Ford became the world's leading industrialist and its second richest man. Was the pioneer of the cheap motor-car, of which, since 1920, more than a million have been produced annually.

Forester, Cecil Scott (b. 1899), British author. His many novels include the *Captain Hornblower* series.

Forster, Edward Morgan, C.H., LL.D. (b. 1879), novelist. Author of *A Passage to India*, *A Room with a View*, and *Abinger Harvest*.

Foscari, Francesco (c. 1372–1457), Doge of Venice from 1423 to 1457. A great historical character, who governed Venice with a firm hand and increased her renown.

Fosdick, Rev. Harry Emerson (b. 1878), the noted American preacher. Was a Baptist Minister 1904–15, since when he has been Professor of Theology, Union Theological Seminary, New York, and Pastor, Riverside, formerly Park Avenue, Baptist Church, New York, 1926–46. One of the best known preachers in the U.S.A.

Fourier, François Charles Marie (1772–1837), the famous French socialist, who propounded a system of associated enterprise for giving everyone ample means on a system of communal industry. He made some attempts to carry out his Utopian ideas, but they did not succeed. He is best known by his *Traité de l'Association Domestique Agricole*.

Fowler, Sir John, Bart., K.C.M.G. (1817–1898), an eminent civil engineer, son of a Sheffield land surveyor. With Sir Benjamin Baker he was the engineer of the Forth Bridge and of the Metropolitan Railway.

Fox, Rt. Hon. Charles James (1749–1806) was the second son of the first Lord Holland. Entered Parliament at nineteen, and became a Lord of the Admiralty in 1770. His opposition to the Royal Marriage Bill drew down upon him the displeasure of George III. Through the whole of Pitt's Premiership he was that statesman's most formidiable opponent. He favoured American Independence; opposed the war with France; was one of the impeachers of Warren Hastings; denounced the Slave Trade and advocated Parliamentary Reform. After the death of Pitt in 1806 he was made Foreign Secretary, but died a few months later, and was buried in Westminster Abbey.

Fox, George (1624–1691), was the founder of the Society of Friends.

Foxe, John (1516–1587), the English martyrologist, whose *Acts and Monuments* (*Book of Martyrs*) is one of the best-known books in the language. Born at Boston in Lincolnshire, he became a clergyman of the Anglican Church and died in London.

Frampton, Sir George James, R.A., F.S.A. (1860–1928). English sculptor. Well known are his Peter Pan statue in Kensington Gardens, and the Edith Cavell Memorial in St. Martin's Place, London.

France, Anatole (Jacques Thibault) (1844–1924), one of France's notable writers of fiction, showing a great mastery of character portrayal and satire. Most of his works are translated into English.

Francis I. (1494–1547), was King of France from 1515 to his death. He was involved in many wars and was taken prisoner by Charles V. of Germany at the Battle of Pavia. After friendly relations had been established between Francis and Henry VIII., the two met on the "Field of the Cloth of Gold."

Francis of Assisi, St. (1182–1226), founded the Franciscan Order of Monks and devoted himself to a holy life. He is a saint of the Roman Church, having been canonised by Pope Gregory IX., and is commemorated on October 4th.

Francis, Sir Philip, K.B. (1740–1818), an English statesman, the reputed author of the famous *Letters of Junius*.

Franck, César Auguste (1822–90), composer and organist, born at Liége in Belgium. From 1872 until his death was professor of organ at the Paris Conservatoire. His music is romantic, mystical, and personal in idiom. Much of his finest composition is for the organ, and his *Symphonic Variations for Piano and Orchestra*, *Sonata for Violin* and the *Symphony in D* rank him, with his younger contemporary Debussy, among the greatest of 19th-century musicians.

Franco, General Francisco (b. 1892), Spanish soldier and Dictator who served with the Spanish Forces in the Moroccan campaign of 1920–23 and was later Head of the Military Academy at Saragossa. Chief of the General Staff 1935–36. Was Commander-in-Chief of the

Nationalist Forces during the Spanish Civil War, 1936–39. President of Spain since Aug. 1939.

Franklin, Benjamin, F.R.S. (1706–1790), the famous American statesman and philosopher, who after serving an apprenticeship as a printer attracted public attention by publishing his *Poor Richard's Almanac.* He then began a series of scientific experiments, inventing among other things the lightning conductor. He was for ten years a member of the General Assembly; then lived in Britain as agent for his State for eighteen years; returning to America he took part in framing the Constitution of the United States.

Franklin, Rear-Admiral Sir John, F.R.S. (1786–1847), the famous Arctic explorer, whose final expedition in command of the *Erebus* and *Terror* ended disastrously, all the members of the expedition perishing. Many attempts were made to discover Franklin, but without obtaining anything save very fragmentary knowledge concerning his fate. He was born at Spilsby.

Franks, Rt. Hon. Sir Oliver Shewell, G.C.M.G., K.C.B., C.B.E., M.A. (b. 1905), British Ambassador to U.S.A. 1948–52; Prof. of Moral Philosophy Univ. of Glasgow 1937–45.

Fraser of the North Cape, Admiral of the Fleet, Lord, G.C.B., K.B.E. (b. 1888), commanded Home Fleet, Eastern Fleet, and British Pacific Fleet successively, 1943–46. First Sea Lord, 1948–51.

Fraser of Lonsdale, Ian, Baron, C.H., C.B.E. (b. 1897). Chairman of St. Dunstan's since 1921. A Governor of the B.B.C., 1937–39 and 1941–46. Life peerage conferred, 1958.

Frazer, Sir James George, O.M., LL.D., F.R.S. (1854–1941), was an eminent British anthropologist; author of *The Golden Bough* and numerous other works on his subject.

Frederick I. (*c.* 1123–90), Holy Roman emperor from 1152. Nicknamed Barbarossa. A commanding personality, he won for the empire prestige unknown since Otto the Great. Though failing to subjugate his Italian territories, for his armies suffered from the Italian climate, he dominated his German subjects, expelled the semi-independent Duke of Saxony, Henry the Lion, from his duchy, encouraged the German cities, and was a national hero. Though not an ascetic, he was remarkable for an impeccable private life, distinguished himself on the second Crusade, and was drowned in Asia Minor on his way to the third.

Frederick II. (1194–1250), Holy Roman Emperor, an enlightened ruler whose court in Sicily was a centre of culture and learning, attracting Jewish, Mohammedan, and Christian scholars. Forced by illness to return from crusade in 1227, he was excommunicated by Pope Gregory IX.; still excommunicated, he again set sail for Palestine and by skilful diplomacy gained possession of Jerusalem, Bethlehem, and Nazareth. Frederick was a philosopher and man of science and delighted in exploding superstition. He founded the university of Naples, was a patron of the medical school at Salerno, wrote a treatise on falconry, and gave Sicily a code of laws.

Frederick II. or **Frederick the Great** (1712–86), King of Prussia (1740–86). By his masterful government and military successes he raised Prussia to the rank of a great power. He was a scholarly potentate, composed music and played the flute.

French, Field-Marshal Sir John. (*See* **Ypres, 1st Earl of.**)

Freud, Sigmund, M.D. (1856–1939), was Professor of Neurology, Vienna University, 1902–38. An eminent psychoanalyst; author of many books on his subject. Left Austria after the *Anschluss* to take up permanent residence in England. Was elected a foreign member of the Royal Society in 1936.

Freyberg, 1st Baron, Lieut.-Gen. Bernard Cyril, V.C., G.C.M.G., K.C.B., K.B.E., D.S.O. (b. 1889), Gov.-Gen. of New Zealand, 1946–52. Served with distinction in both world wars. Commanded Allied troops on Crete, 1941. Won third bar to D.S.O. in Italy, 1945.

Friese-Greene, William (1855–1921), inventor of the cinematograph. His pioneer work in commercial photography brought him no profit, and for many years he lived in poverty.

Frobisher, Sir Martin (1535–1594), was the earliest of British navigators to attempt to find the North-West passage from the Atlantic to the Pacific through the Arctic seas, and his name is commemorated in Frobisher's Strait, to the south of Baffin Land. For his services in connection with the defeat of the Spanish Armada he was knighted.

Froebel, Friedrich Wilhelm August (1782–1852), was the founder of the Kindergarten system of education, the object of which is "to give children employment in harmony with their nature, to strengthen their bodies, to exercise their senses and lead them up to the original ground of all life, to the idea of unity with themselves."

Froissart, Jean (1337–1410), a celebrated French writer who visited England and Scotland, and was the author of the famous *Chronicles,* which tell us so much of the achievements of the barons of old.

Frost, Robert (b. 1874), best loved of American poets. "Stopping by Woods on a Snowy Evening"; "Birches"; "The Death of the Hired Man"; "After Apple-Picking". Awarded Pulitzer Prize for poetry in 1924, 1931, 1937, and 1943.

Froude, James Anthony (1818–1894), the celebrated historian and biographer of Carlyle.

Fry, Elizabeth (1780–1845), a Norwich lady who devoted much of her life to the promotion of prison reform, and achieved considerable reputation as a preacher. She belonged to the Society of Friends.

Fry, Christopher (b. 1907), English poet and dramatist of Quaker family. Author of *The Lady's Not for Burning, Venus Observed,* and *The Darkness is Light Enough.*

Fry, Roger (1866–1934), English art critic and painter. Introduced the work of Cézanne and the post-impressionists into England. His most important book is *Vision and Design.* Biography by Virginia Woolf (1940).

Fuchs, Sir Vivian Ernest, M.A., Ph.D. (b. 1908), British geologist and explorer. Dir. of the Falkland Islands Dependencies Scientific Bureau since 1951; leader of the British Commonwealth Trans-Antarctic Expedition 1957–58, the first to cross the Antarctic continent.

Fuller, Thomas (1608–1661), the author of *Worthies of England* and a *Church History of Britain,* two well-known and valuable works.

Fulton, Robert (1765–1815), an inventive American engineer who distinguished himself by experiments in the application of steam to navigation, and finally in 1807, launched the *Clermont* on the Hudson.

Furniss, Harry (1854–1925), British caricaturist, was born in Wexford and came to London as a young man. He was a famous cartoonist and served on the staff of *Punch* from 1878–94. Illustrated the works of Dickens and Thackeray.

Furse, Dame Katharine, G.B.E., R.R.C. (1875–1952), pioneer of women's services, daughter of John Addington Symonds. C.-in-C. V.A.D.s, 1914–17; Director W.R.N.S., 1917–19; Dir. World Bureau Girl Guides and Girl Scouts, 1928–38.

Furtwängler, Wilhelm (1886–1954), famous German conductor, and popular in Great Britain for his visits with the Berlin Philharmonic Orchestra, of which he succeeded Herr Nikisch as conductor.

G

Gade, Niels Vilhelm (1817–90), Danish composer. While studying at Leipzig he met Mendelssohn, whom he succeeded as conductor of the Gewandhaus orchestra. He wrote eight symphonies, chamber music, and choral works. Though characteristically Scandinavian, his work shows the influence of German romanticism.

Gainsborough, Thomas, R.A. (1727–1788), English landscape and portrait painter, whose works are remarkable for their grace and refinement. His *Duchess of Devonshire* was stolen when exhibited in 1876 and recovered in America some years later.

Gaiseric or **Genseric** (*c.* 390–477), king of the Vandals, the ablest of the barbarian invaders of the Roman empire. He led his people from Spain into Africa, took Carthage, gained control of the Mediterranean by his pirate fleets, and

sacked Rome in 455, thereby bringing about the fall of the western empire.

Gaitskell, Rt. Hon. Hugh Todd Naylor, C.B.E., M.P. (b. 1906), elected leader of the Parliamentary Labour Party when Earl Attlee retired in 1955. Has had distinguished career as economist, Civil Servant, and Chan. of Exchequer, 1950–51. M.P. for South Leeds since 1945.

Gale, General Sir Richard, G.C.B., K.B.E., D.S.O., M.C. (b. 1896), Commander of 6th Airborne Div. which landed in Normandy in June 1944; C.-in-C. B.A.O.R., 1952–56; succeeded Lord Montgomery as Deputy to General Norstad, 1958–.

Galen, Claudius (A.D. 131–201), physician, b. Pergamum (Asia Minor) of Greek parents. He lived most of his life in Rome, established a large practice, and became court physician to Marcus Aurelius. He systematised medical knowledge in accordance with his idea of purposive creation by the will of God. This unscientific attitude, by discouraging original investigation, hampered medical progress for a thousand years. Many of his treatises still survive.

Galileo (1564–1642), great Italian scientist whose experimental-mathematical methods in the pursuit of scientific truth laid the foundations of modern science. He became professor of mathematics at Pisa university when he was 25 and lectured at Padua university for 18 years. He made a number of fundamental discoveries, *e.g.*, in regard to the hydrostatic balance, thermometer, magnet, telescope, and foreshadowed Newton's laws of motion. He detected the satellites of Jupiter, the ring of Saturn, and the spots of the sun. He proved the superiority of the Copernican over the Ptolemaic theory, and was imprisoned for so doing. He died the year Newton was born.

Galsworthy, John, O.M. (1867–1933), an English novelist and dramatist of force and originality who wrote a great series of novels dealing with the history of an upper middle class family. Awarded Nobel Prize for Literature in 1932.

Galton, Sir Francis, F.R.S. (1822–1911), founder of eugenics, cousin of Darwin. His early work, *Meteorographica* (1863), contains the basis of the modern weather chart. He is also remembered for his device of finger-print identification and for being one of the first to apply mathematics to biological problems.

Galvani, Luigi (1737–1798), Italian physician and physiologist, whose experiments at Bologna university demonstrated the principle of animal electricity.

Gama, Vasco da (*c.* 1460–1524), the adventurous Portuguese navigator who discovered the sea route to India in 1498 by doubling the Cape of Good Hope.

Gandhi, Mohandas Karamchand (1869–1948), great Indian patriot, social reformer, and moral teacher. Believed in the doctrine of non-violence. In the tense situation following the granting of independence to India, he strove to promote the co-operation of all Indians but was assassinated on his way to a prayer meeting.

Garbo, Greta (b. 1905), Swedish film actress. The most arresting and poetical actress on the screen of her day.

Garcia, Manuel de Popolo Vicente (1775–1832), Spanish tenor, composer, and singing master. His son **Manuel Patricio Rodriguez** (1805–1906) was tutor to many celebrities including Jenny Lind. Both his daughters (Mme Malibran and Mme Viardot) were celebrated operatic singers. His grandsons taught at the Royal Academy of Music and the Royal College of Music in London.

Gardiner, Samuel Rawson (1829–1902), an English historian, whose works deal mainly with the period from the accession of James I. to the end of the Commonwealth. Many of his books remain the standard authorities on their subjects.

Garibaldi, Giuseppe (1807–1882), the famous Italian soldier and patriot. In 1834 he was condemned to death for being concerned in a plot to seize a Government vessel, but escaped to South America, and for some years was engaged in various conflicts for liberty in that hotbed of revolution. Returning to Italy in 1848, he joined the Roman Republican movement, but was ultimately compelled to fly for his life, and emigrated to New York. In 1854 he returned to Italy, and on the outbreak of war in 1859 had a command given to him, and scored several victories against the Austrians. The next year found him at the head of a great volunteer army, intent upon liberating Italy. This tremendous task he successfully carried through, earning the admiration of the world for his generalship and patriotism.

Garrick, David (1717–1779), the leading tragic actor of his time and a highly successful manager. Was buried in Westminster Abbey.

Garrison, William Lloyd (1805–1879), an eminent anti-slavery leader of America.

Garvin, James Louis, C.H. (1868–1947), editor of the *Observer*, 1908–42, and of the *Encyclopaedia Britannica* (14th ed.), 1926–29.

Gaskell, Mrs. Elizabeth Cleghorn (1810–1865), an English novelist of acknowledged power, whose *Mary Barton*, *Ruth*, *Cranford*, and other stories dealing largely with Lancashire life achieved great popularity. Her *Life of Charlotte Brontë* was also a remarkable book.

Gaulle, Charles André Joseph Marie de (b. 1890), French general and statesman, chosen President of the Fifth Republic, Dec. 1958. On collapse of France in 1940 refused to surrender, but raised and led the Free French fighting forces, with headquarters in England and Cross of Lorraine as emblem. Attacked constitution of the Fourth Republic, refused to ally himself with any of the political parties, and in 1947 founded the R.P.F. (Rally of the French People) in opposition to the left wing. Took no part in parliamentary life from 1953 until June 1958, when a rebellion of colonists in Algeria brought him to supreme power.

Gautier, Théophile (1811–1872) was an eminent French critic and novelist who at one time filled the position of secretary to Balzac. His romance, *Mademoiselle de Maupin*, caused a great sensation. He was also a poet of considerable power.

Gay, John (1685–1732), the English poet who penned *The Beggar's Opera* and the well-known collection of poetic fables. He was a writer of great wit and fancy, and much patronised by Society.

Gay-Lussac, Joseph Louis (1778–1850), a French chemist, whose experiments in connection with gases and vapours were of much scientific importance.

Ged, William (1690–1749), was one of the inventors of the process of stereotyping. He was a goldsmith and a native of Edinburgh.

Geikie, Sir Archibald, O.M., K.C.B., F.R.S. (1835–1924), noted geologist; President of the Royal Society 1908–13.

Geikie, Prof. James, F.R.S. (1839–1915), brother of the foregoing, and his successor in the Chair of Geology at Edinburgh University in 1882. His work on *The Great Ice Age* is a notable one.

Geoffrey of Anjou, Duke of Brittany (1113–51), founder of the Angevin dynasty of England, was son-in-law of Henry I. and father of Henry II., the first Angevin or Plantagenet king.

Geoffrey of Monmouth (1100–1154), was the author of the famous Old English chronicle which bears his name. He was born at Monmouth, and became Bishop of St. Asaph in 1152. His *Chronicon* is a compilation from older authors, and is notable for having contained the stories of King Arthur, King Lear, and Cymbeline.

George I. (1660–1727) was King of Great Britain from 1714 to his death, ascending the throne as direct descendant of James I. His reign saw many memorable events, including the Jacobite Rebellion, the South Sea Bubble, and the beginning of Walpole's great ministry.

George II. (1683–1760), son of the last-named, was King of Great Britain from 1727 to 1760. His reign covered a prosperous period in spite of wars and rebellions, and saw the Empire extended in India and North America, but the King was personally a man of limited power and achievement.

George III. (1738–1820), was the grandson of George II., and reigned from 1760 to 1820. He was a popular monarch for the most part, possessing all the domestic virtues and of simple tastes. The war with America lasted from 1775 to 1782, when the American States gained their independence, and from 1793 to 1815 the war with France was kept up with but little interruption. On the other hand, the

Empire in India was strengthened and enlarged, and the power of Great Britain on land and sea was splendidly shown.

George IV. (1762–1830) reigned from 1820 to his death, but filled the position of Prince Regent for some years previously. The King's personal character, in spite of the fact that he was called "The First Gentleman in Europe," showed such a want of dignity, and such an abandonment to licentiousness and frivolity, that he became very unpopular with the people.

George V. (1865–1936), was the second son of Edward VII. and Queen Alexandra. Entered the Navy as a cadet in 1877 and became second in the line of succession to the throne on the death of the Duke of Clarence in 1892. Married to Princess Mary of Teck in 1893. Succeeded to the throne May 6th, 1910, and celebrated his Silver Jubilee in 1935. Maintained the royal tradition of strenuous public engagements combined with unfailing attention to business of State.

George VI. (1895–1952), (Albert Frederick Arthur George of Windsor), second son of George V., was called to the throne in December 1936 on the abdication of his elder brother, Edward VIII. His reign was marked by the ordeal of war, by world revolution and social change and at the same time by a remarkable degree of constitutional harmony which his fine example and personal qualities did much to achieve.

George, Henry (1839–1897), American political economist whose "single tax" on land values as a means of solving economic problems is expounded in his *Progress and Poverty*, pub. 1879.

George, Saint, the tutelary saint of England, adopted by Edward III. He is believed to have been a native of Cappadocia and a vigorous champion of Christianity in the days of Diocletian, and to have suffered martyrdom at Nicomedia 303 A.D. The dragon which he is said to have slain symbolises the powers of evil over which he triumphed.

German, Sir Edward (1862–1936), English composer, best known for his incidental music and light opera *Merrie England*. (His name was originally Edward German Jones.)

Gershwin, George (1898–1937), American jazz pianist and song-writer, composer of the famous *Rhapsody in Blue* and other works including the negro "folk-opera" *Porgy and Bess*.

Gesner, Konrad von (1516–1565), a scholarly Swiss naturalist, and father of the science of zoology.

Ghiberti, Lorenzo (1378–1455), Florentine sculptor whose bronze doors, beautifying the baptistery in Florence, were described by Michaelangelo as fit for the gates of paradise.

Gibbon, Edward (1737–1794), celebrated historian of the *Decline and Fall of the Roman Empire*.

Gibbons, Grinling (1648–1720), the celebrated wood-carver and sculptor, was born at Rotterdam and was brought to the notice of Charles II. by Evelyn, the diarist. The choir stalls of St. Paul's and the carving in the Wren library at Trinity College, Cambridge, are his work.

Gibbons, Orlando (1583–1625), a noted English composer of Church music who was organist of the Chapel Royal.

Gibson, Charles Dana (1867–1944), the famous American black-and-white artist and book illustrator, creator of "the Gibson girl."

Gide, André Paul Guillaume (1869–1951) French man of letters, novelist, dramatist and poet. Awarded the Nobel Prize for Literature in 1947.

Gielgud, Sir (Arthur) John (b. 1904), English actor, member of the Terry family. Began by walking on at the Old Vic, and, later, became a Shakespearian actor, making a marked success as Hamlet, Richard II., and Prospero.

Gigli, Beniamino (1890–1957), the great Italian operatic tenor of the Metropolitan Opera House New York. The possessor of a voice of great natural beauty, and one of the finest exponents of the music of Puccini and Verdi.

Gilbert, Sir Alfred, M.V.O., R.A., (1854–1934), sculptor and designer of gold and silver objects. Among his best-known sculptures are *Perseus Arming*, *Icarus*, *Eros* in Piccadilly Circus, the Shaftesbury Memorial and the Duke of Clarence Memorial at Windsor.

Gilbert, Sir Humphrey (1539–1583), knighted by Queen Elizabeth for his bravery in Ireland, later made voyages of discovery, and added Newfoundland to the British possessions.

Gilbert, Sir John, R.A. (1817–1897), one of the most prolific artists of his time. His illustrations to Staunton's edition of Shakespeare are remarkable for their picturesqueness and dramatic power.

Gilbert, William (1543–1603), physician to Queen Elizabeth I., has been called the father of electric and magnetic science. Published his great book on the magnet in 1600.

Gilbert, Sir William Schwenck (1836–1911), English humorist and playwright, is best remembered for the "Bab Ballads" and for the famous Savoy series of operas in which he collaborated with Sir Arthur Sullivan. Among the operas are *H.M.S. Pinafore*, *Patience*, *Iolanthe*, *The Mikado*, *The Gondoliers*, and *The Yeomen of the Guard*. The Gilbertian humour of plot and paradox, the kindly satire and the delightful metres combine with Sullivan's music to make the operas unforgettable and ever popular.

Gill, Arthur Eric Rowton, A.R.A. (1882–1940), English sculptor and engraver. His first piece of sculpture, *Madonna and Child*, was produced in 1910 and in 1913 he received the commission to carve the Stations of the Cross for Westminster Cathedral. In 1922–23 he carved the relief, *Christ Driving the Money-changers from the Temple*, which is placed at the entrance of Leeds University as a War Memorial. Executed the carvings on Broadcasting House, London; also worked as a designer for printing; the Gill Sans type and the George VI stamps were his designs.

Gillray, James (1757–1815), the eminent caricaturist of the time of George III., who produced upwards of a thousand political cartoons.

Giotto di Bondone (*c.* 1266–*c.* 1337), great Florentine artist, the first to break away from byzantine tradition and paint in a naturalistic way. Much of his work has perished but still surviving are the great frescoes in the churches of Assisi, Padua, and Florence. He designed the western front of the cathedral at Florence and the campanile, the lower part of which was completed from his designs before his death.

Gissing, George Robert (1857–1903), English author whose novels deal with poverty and the sociological problems of his day. *New Grub Street*, *The Unclassed*, *Charles Dickens, A Critical Study*, *The Private Papers of Henry Ryecroft* are among his best-known works.

Giulio Romano or **Giulio Pippi** (*c.* 1492–1546) was a pupil of Raphael, and himself a distinguished painter and architect.

Gladstone, Rt. Hon. William Ewart (1809–98), the great Liberal statesman of the latter part of the nineteenth century, popularly known as the Grand Old Man. Entered Parliament in 1832 as a Tory, held various offices under Peel, and joined the Aberdeen coalition in 1852. From that time he served several terms as Chancellor of the Exchequer and was Liberal Prime Minister, 1868–74, 1880–85, 1886, and 1892–94. His financial policy was able, accurate, lucidly exposed, and very successful. His first ministry was active, its legislative achievements including the Disestablishment of the Church of Ireland, the Education Act of 1870, the Ballot Act of 1872, and the Irish Land Act, but in 1873 they were aptly described by Gladstone's great rival, Disraeli, as "exhausted volcanoes." His second ministry, returned to power after the astonishing Midlothian campaign, witnessed the defeat by the Boers at Majuba, the bombardment of Alexandria, and the disaster of General Gordon at Khartoum. His last two ministries were marked by the adoption of the policy of Home Rule for Ireland, which he was unable to carry. Gladstone was a good classical scholar and an earnest high churchman, who in 1838 published the *State in its Relations with the Church*, a work of considerable interest.

Glazunov, Alexander Constantinovich (1865–1936), Russian composer, pupil of Rimsky-Korsakov. He was an accomplished and prolific composer, the first of his eight symphonies being composed when he was only 16.

Glendower, Owen (1359–1415), a famous Welsh chieftain who proved a formidable opponent to Henry IV., and gathered around him a great following of Welshmen, whom he led with much bravery, though finally defeated in 1405.

Glinka, Mikhail Ivanovich (1804–57), Russian composer whose music has a strong folk-song element. Notable among his works are his two operas, *A Life of the Tsar* and *Russlan and Ludmilla*, based on a poem by Pushkin. He is recognised as the first of the Russian national school.

Gluck, Christoph Willibald (1714–87), German composer, a figure of great historical importance in the development of the opera. He was the son of a Bohemian forester and studied in Prague, Vienna, and Italy. His first operas were in the Italian tradition, but with *Orfeo ed Euridice* (1762), inspired by classical Greek drama, he began his reform of the opera. Then followed the great operas *Alceste*, *Armide*, and *Iphigénie en Tauride* (1779), which is considered his masterpiece.

Goddard, Lord, P.C., Q.C. (b. 1877), Lord Chief Justice of England, 1946–58.

Godfrey of Bouillon (c. 1061–1100) was the leader of the First Crusade, and after the conquest of Jerusalem, exchanged the title of King for that of "Protector of the Holy Sepulchre." He liberated the Holy Land, and was buried on Mount Calvary.

Godiva, Lady (1040–1080), was the pious and beautiful wife of Leofric, Earl of Chester and Lord of Coventry. Having appealed to her lord to remit certain impositions from the inhabitants, he promised to grant her request if she would ride naked through the town. This she did, having first passed the word to have blinds and shutters drawn at the appointed hour, and so obtained the people's ransom.

Godwin, Earl of the West Saxons (990–1053), was one of the most influential noblemen of his time and gave his daughter in marriage to Edward the Confessor, against whom he was afterwards in rebellion. Godwin's son, Harold, claimed the throne after Edward's death, but was killed at Hastings.

Godwin, William (1756–1836), English Radical philosopher, author of *Political Justice* and a novel, *Caleb Williams*. Married Mary Wollstonecraft (1759–97), author of *A Vindication of the Rights of Women*, in which she pleaded for the equality of the sexes, particularly in education. Their daughter, Mary Wollstonecraft Godwin (1797–1851), married the poet, Shelley, and was the author of *Frankenstein*.

Goethe, Johann Wolfgang von (1749–1832), German poet of great gifts and versatility. Born at Frankfurt on Maine of a cultivated and well-to-do family, he was able to integrate all the powers with which nature had endowed him in one harmonious personality. Before he went to Weimar at the age of 25 he had written *Götz von Berlichingen* and *Werthers Leiden* and many beautiful lyrics. He settled at Weimar in 1775, received a Ministerial appointment and actively interested himself in the welfare of the state. *Faust*, the great dramatic poem which accompanied him from early manhood to the end, epitomises his whole life and was his crowning achievement. Not only was he a great poet, but scientist and philosopher besides.

Gogol, Nikolai Vasilievich (1809–52), one of the greatest of Russian novelists whose stories of provincial life are in the same setting as his masterpiece, *Dead Souls* (1842), of which an English translation appeared in 1906. Was also a playwright, his most successful play being *The Government Inspector* (1836), a satire on provincial bureaucracy.

Goldsmith, Oliver (1728–1774), the celebrated author of *The Vicar of Wakefield*, *The Deserted Village*, and *She Stoops to Conquer*. The son of a poor Irish curate, he found his way to London in 1756, subsequently devoting himself entirely to literature, being befriended by Dr. Johnson and held in great esteem by Reynolds, Burke and other eminent men of the time. He was buried in the churchyard of the Temple.

Goodyear, Charles (1800–1860), an American, discoverer of the art of vulcanising rubber, by which the utility of the material was greatly extended.

Goossens, Sir Eugène (b. 1893), English composer and conductor of Belgian parentage. He has been associated with many famous orchestras, and his compositions include the operas *Judith* and *Don Juan de Mañara*. His brother Léon is a celebrated oboe virtuoso, both his sisters are gifted harpists, and his father and grandfather, who also bore the name Eugène, were conductors.

Gordon, Adam Lindsay (1833–1870), an Australian poet who wrote many stirring ballads and poems, his *Bush Ballads and Galloping Rhymes* being a great success. As a settler, however, he failed, and, after numerous unfortunate experiments, committed suicide.

Gordon, Major-General Charles George, C.B. (1833–1885), a distinguished soldier, administrator, and earnest Christian, who had a most adventurous, useful, and self-sacrificing career. He saw active service in the Crimea, China, and India, and in 1873 was made Governor of the Equatorial provinces of Egypt. In 1877 he went out to the Sudan for the Egyptian Government, and in 1884 again proceeded thither on behalf of the English Government to deal once more with the difficulties which had arisen consequent on the Mahdi's Rebellion. While defending Khartoum he was murdered by the Mahdi's forces on the palace staircase.

Gordon, Lord George (1751–1793), was tried for treason as the instigator of the Anti-Popery riots of 1780, but acquitted on the ground that he had no treasonable intention. Some years later he was committed to Newgate for libelling Marie Antoinette and died there of fever.

Gorky, Maxim (Alexi Maximovitch Pieshkov) (1868–1936), Russian novelist and writer whose works are remarkable for their realistic power. Was in turn shoemaker's apprentice, gardener, watchman, scullion on a packet boat and baker's apprentice. In 1892 his first story was published, and he found his vocation.

Gosse, Sir Edmund, C.B., LL.D., Litt.D. (1849–1928), a distinguished poet and critic who wrote lives of Gray, Congreve and Dr. Donne, and his *History of 18th Century Literature* and *History of Modern English Literature* show great critical power and appreciation. Was librarian to the House of Lords 1904–14, and wrote a book on French literary men and a life of Sir Thomas Browne. In 1907 he published *Father and Son*, being recollections of his father.

Gould, Sir Francis Carruthers (1844–1925). Perhaps the cleverest political caricaturist of his day, and did also considerable journalistic work as assistant editor of the *Westminster Gazette*.

Gould, Jay (1836–1892), American financier and railway magnate, who acquired an enormous fortune in Wall Street speculations.

Gounod, Charles François (1818–93), French composer whose fame rests chiefly on his operas *Faust* and *Roméo et Juliette*, though his lyrical gifts are best shown in some of his earlier works, such as *Le Médicin malgré lui* and *Mireille*. He also wrote oratorios and church music.

Gower, John (1325–1408), an English poet of the time of Chaucer, who wrote many elegant ballads and devotional poems. His *Confessio Amantis* was his outstanding work.

Goya y Lucientes, Francisco José (1746–1828), a famous Spanish painter and etcher, and one of the greatest of Spanish artists, and renowned for his wonderful series of etchings and satirical drawings. There are four Goya paintings in the National Gallery. One of his fine portraits is that of the Duchess of Alva. In addition to portraits and genre he painted frescoes in the Cathedral at Saragossa. As versatile as he was facile, he also occupies a high position among etchers.

Grace, Dr. William Gilbert (1848–1915), renowned and almost legendary cricketer who by his character and skill dominated English cricket for over forty years, and was probably the best-known man in England. Altogether in first-class cricket he scored 54,896 runs, including 126 centuries, and took 2876 wickets. Scored 1000 runs in May 1895; and three times made over 300 runs in an innings.

Graham, John, of Claverhouse, Viscount Dundee (1643–1689). Renowned for his sturdy adherence to the Stuarts, and headed a rebellion in Scotland against William and Mary, but was killed at the Battle of Killiecrankie.

Grahame, Kenneth (1859–1932), as a writer of books for children ranks almost with Lewis Carroll. *The Golden Age*, *Dream Days*, and *Wind in the Willows*, all achieved great popularity.

Grahame-White, Claude (1879–1959), aviator and

engineer, the first Englishman to gain an aviator's certificate, 1909; won the Gordon Bennett Cup with the then record speed of 60½ miles per hour in 1910, founded the first British Flying School and published many works on aircraft from both the historical and technical aspects.

Grainger, Percy Aldridge (b. 1882), U.S.A. citizen, born in Australia, pianist and composer. A brilliant player and an authority on folk-song, the influence of which is apparent in all his compositions.

Grant, General Ulysses Simpson (1822–1885), the most distinguished American general of the Civil War. Was President of the United States from 1869 to 1876.

Granville-Barker, Harley, D.Litt., LL.D., F.R.S.L. (1877–1946), distinguished English dramatist, producer, and actor. Introduced plays of Ibsen and Shaw to British public. His own plays reflect influence of Shaw, and are particularly notable for their realistic dialogue.

Grattan, Henry (1746–1820), an Irish orator and statesman who, first in the Irish Parliament and afterwards in the Imperial Parliament, did memorable work for the cause of his country.

Gray, Thomas (1716–1771), the English poet, whose *Elegy written in a Country Churchyard* is one of the most beautiful in the language. His other poems were not numerous but included a fine *Ode on a Distant Prospect of Eton College* and a notable *Ode to Adversity.*

Greeley, Horace (1811–1872), founder of the *New York Tribune* and a political writer of great power and influence. Was an unsuccessful candidate for the United States Presidency in 1872.

Green, John Richard (1837–1883), an eminent English historian. Published a *Short History of the English People* in 1874.

Greenaway, Kate (1846–1901), a gifted book illustrator and water-colour artist, whose drawings of children were full of charm and delicacy and gained her great popularity and the warm approval of no less a critic than Ruskin.

Greene, Graham (b. 1904), author of the novels *Brighton Rock, The Power and the Glory, The Heart of the Matter* and a play *The Living Room.*

Gregory, St. (257–336), was founder of the Armenian Church, and spent his last years in a cave at the foot of Mount Sebuh.

Gregory the Great, St. (*c.* 540–604), Pope 590–604. The last great Latin Father and the forerunner of scholasticism. The real founder of the temporal power and the political influence of the papacy, he also maintained the spiritual claims of Rome, enforcing discipline, encouraging monasticism, defining doctrine, and adding to the music liturgy, and canons of the Church. Thus he exerted enormous influence on the life and thought of the Middle Ages.

Gregory VII (*c.* 1020–85), Pope from 1073. Originally called Hildebrand. Battled for papal omnipotence within the Church, stamping on simony and the marriage of priests. His victory in the conflict of empire and papacy came when the emperor, Henry IV, did penance for three days in the snow at Canossa, but had the unfortunate result of leading to further internal dissensions in Germany and to papal absorption with power politics rather than to Gregory's aim of an ideal theocracy embracing all States.

Gregory XIII (1502–85), Pope, 1572–85; introduced the Gregorian calendar.

Grenville, Sir Richard (1541–1591), the Elizabethan sea-captain, who with his one ship engaged a fleet of Spanish war-vessels off Flores, in 1591, was captured and shortly after died on the Spanish flagship *San Pablo*, an exploit celebrated in Tennyson's noble ballad, *The Revenge.*

Gresham, Sir Thomas (1519–1579), was the wealthiest London merchant and financier of his time. He built the first Royal Exchange and founded Gresham College. The son of Sir Richard Gresham (Lord Mayor of London), he succeeded his father as King's Agent at Antwerp, and proved an astute money-finder for the Court in four successive reigns, ending as Queen Elizabeth's " Royal Merchant."

Greuze, Jean Baptiste (1725–1805), French painter, whose works, especially his studies of girls, display much delicacy and beauty of handling.

Grey, Charles, 2nd Earl, K.G. (1764–1845), a great English Whig statesman under whose Premiership were passed the Reform Bill of 1832, the Bill abolishing slavery throughout the British Empire (1833), and the Poor Law Amendment Act, 1834.

Grey, Lady Jane (1537–1554), was the daughter of the Duke of Suffolk and great-granddaughter of Henry VII. On the death of Edward VI. she was proclaimed Queen, but only reigned for nine days, Queen Mary ousting her and maintaining the Tudor succession. Six months later Lady Jane and her husband, Lord Guildford Dudley, were executed.

Grey of Fallodon, 1st and only Viscount, K.G., P.C. (1862–1933). Under-Secretary for Foreign Affairs, 1892. Foreign Secy., 1905–16. He won high approval for his handling of the Balkan difficulties of 1912–13, and all through the difficult strain which preceded Germany's rush into war acquitted himself with force and dignity. Leader of Liberal Party in House of Lords until Aug. 1924. Chancellor of Oxford Univ., 1928–33.

Grieg, Edvard Hagerup (1843–1907), a Norwegian musical composer, who presented the characteristics of his country's music with strong accentuation in numerous compositions of great melodic beauty.

Griffin, His Eminence Cardinal Bernard William (1899–1956), Roman Catholic Archbishop of Westminster from 1944 until his death.

Griffith, Arthur (1872–1922), was the first President of the Irish Free State 1921; founder and first editor of *Sinn Fein* 1906–15, and founder of the *Sinn Fein* movement.

Griffith, David Wark (1880–1948), pioneer American film producer. Noted especially for his remarkable films *Broken Blossoms* and *The Birth of a Nation.* Invented much of the technique of the modern cinema, such as the close-up, the flash-back, and the fade-out, and developed many famous stars, including Mary Pickford, L. Barrymore, and D. Fairbanks, Sr.

Grimm, the brothers **Jakob Ludwig Karl** (1785–1863) and **Wilhelm Karl** (1786–1859), German philologists and folk-lorists who wrote the world-famous *Fairy Tales.* They planned a gigantic etymological dictionary of the German language, which is being completed by German scholars.

Grimthorpe, 1st Baron, LL.D. (1816–1905), long known as **Sir Edmund Beckett,** Bt., K.C., was a great authority on horology, and, with Professor Sir George Airy (*q.v.*), designed " Big Ben." He restored St. Albans Cathedral at his own cost.

Gromyko, Andrei A. (b. 1908), Russian diplomat; succeeded D. T. Shepilov as Foreign Minister, Feb. 1957. Ambassador to Britain, 1952–3, and to the U.S.A., 1943–46. Representative of the Soviet Union on the U.N. Security Council, 1946–49.

Gronchi, Giovanni (b. 1888), succeeded Signor Einaudi as President of the Italian Republic in 1955 and is a member of the left-wing of the Christian Democrat Party.

Grossmith, George (1847–1912), the well-known actor and entertainer. His father, George Grossmith the elder, was also a popular entertainer and lecturer, his brother, Weedon Grossmith, was an actor and artist of considerable attainments, and his son, **George Grossmith** (1874–1935), was a successful comedian, and the first to introduce revue and also cabaret entertainment into England.

Grote, George (1794–1871), English historian famous for his *History of Greece*, 1846–56, an epoch-making and standard work.

Grotius, Huig van Groot (1583–1645), Dutch jurist, the founder of international law. He was condemned to life imprisonment for supporting religious toleration but made a daring escape and found refuge in Paris, where he wrote his masterpiece *De Jure Belli et Pacis.*

Grouchy, Marshal Emmanuel, Marquis de (1766–1847), a famous Napoleonic general who, at Hohenlinden, Wagram, and in the Moscow retreat rendered signal service. After Waterloo he led the defeated army back to Paris.

Grove, Sir George (1820–1900) was a distinguished engineer and bridge and lighthouse builder, but better known as an enthusiastic lover of music, the study and performance of which in England he did much to promote. His *Dictionary of*

Music and Musicians is the leading work of its kind.

Guedalla, Philip, M.A. (1889–1944), was an English historian and essayist. Author of *The Partition of Europe* (1914), *The Second Empire* (1922), *Palmerston* (1926), *The Missing Muse* (1929), *The Duke* (1931), and other works.

Gustavus Adolphus, King of Sweden (1594–1632) the "Lion of the North," after a lengthy campaign in Poland, entered the Thirty Years' War in support of Swedish interests and Protestant distress, won the Battle of Breitenfeld in 1631, and was killed in action the next year. Succeeded by his daughter, Christina, and his policy carried on by his minister, Oxenstierna.

Guy, Thomas (1644–1724), founder of Guy's Hospital, was a dealer in Bibles, speculator and money-lender, who after making a large fortune, bequeathed £300,000 for the erection and endowment of the famous hospital.

Gwynne, Nell (1650–1687), was originally, it is said, an orange girl of provincial birth, and afterwards a sprightly London dancer and actress, who became mistress to Charles II. Her eldest son was made Duke of St. Albans.

H

Haakon VII. (1872–1957), King of Norway. Formerly Prince Carl of Denmark, second son of Frederick VIII.; elected to the throne on the separation of Norway from Sweden in 1905. Married Princess Maud, youngest daughter of King Edward VII. in 1896. Lived in England with his exiled government during German occupation, 1940–45.

Hadfield, Sir Robert Abbott, Bt., F.R.S. (1858–1940), English metallurgist whose discovery of manganese steel in 1882 brought him recognition from every steel producing country.

Hadrian (76–138) was Emperor of Rome in succession to his uncle Trajan, and one of the greatest of Roman rulers. He visited Britain, and in A.D. 121 built the wall between Newcastle and Carlisle for protection of his dominions against the Picts and Scots.

Hafiz, pseudonym of Shams ad-Din Mohammed (1320–1389), great Persian lyrical poet. His principal work is the *Divan*, a collection of short sonnets called *ghazals*. The sobriquet *Hafiz*, meaning one who remembers, is applied to any one who has learned the Koran by heart.

Hahnemann, Samuel Christian Friedrich (1755–1843), the German physician who founded the system of homœopathy.

Haig, Field-Marshal, 1st Earl of Bemersyde, K.T., G.C.B., O.M., G.C.V.O., K.C.I.E. (1861–1928), C.-in-C. of the British Expeditionary Forces in France and Flanders, 1915–19. His name is associated with the sale of poppies in aid of the British Legion.

Haile Selassie I., G.C.B., G.C.M.G., G.C.V.O. (b. 1891), Emperor of Ethiopia, April 1930 to May 1936, and since May 1941.

Hailsham, 2nd Viscount, Quintin McGarel Hogg, Q.C. (b. 1907), Chairman Conservative Party, 1957–59; Lord Privy Seal and Min. for Science and Technology, 1959–.

Hakluyt, Richard (1553–1616), the first of English naval historians. By his *Divers Voyages touching the Discovery of America*, and *Principal Navigations, Voyages, and Discoveries of the English Nation*, did much to help forward the colonising spirit.

Haldane, John Burdon Sanderson (b. 1892), British physiologist and geneticist, son of John Scott Haldane (1860–1936), whose researches led to improvements in public health and industrial safety. Formerly Weldon Prof. of Biometry at University College, London; emigrated to India, July 1957.

Haldane, Viscount, P.C., K.T., O.M., F.R.S. (1856–1928), sat for Haddingtonshire, 1885–1911. In 1901 was Vice-President of the Liberal Imperialist League, and at the close of 1905 was made War Minister and organised the Territorial Force. Lord Chancellor, 1912–15, and again in first Labour Government, 1924.

Halévy, Ludovic (1834–1903), a brilliant French writer who supplied Offenbach with libretti for some of his most famous comic operas; among them *La Belle Hélène*, *La Grande Duchesse*, and *Barbe Bleue*. In conjunction with Meilhac he wrote several notable plays of which *Frou-frou* was perhaps the most successful.

Halifax, Charles Montague, Earl of (1661–1715), seventeenth century financier who was responsible for the National Debt, the window tax, the revaluation of the currency, and the foundation of the Bank of England.

Halifax, 1st Earl of, Edward Frederick Lindley Wood, K.G., P.C., O.M., G.C.S.I., G.C.I.E., T.D. (1881–1959), filled many difficult positions with distinction and success and was especially notable as Viceroy of India, 1926–31, Foreign Secretary, 1938–40, and British Ambassador in Washington, 1940–45. He wrote a life of John Keble and was prominent in the life of the Church of England. Chancellor of Oxford University 1933–59.

Halifax, George Savile, Marquess of (1633–95), author of *Advice to a Daughter* and *Character of a Trimmer*, was a gifted and independent politician, pamphleteerist, and orator.

Hallam, Henry (1777–1859), a graceful and scholarly historian who contributed several important works. His *View of the State of Europe during the Middle Ages*, *Constitutional History of England*, and *Introduction to the Literature of Europe* are distinguished for their clearness of style and correctness of judgment.

Hallé, Sir Charles (1819–1895), a distinguished pianist and conductor who was born in Westphalia. Went to Paris to study music in 1836, and in 1848 settled in London, where he soon became known as a piano-player of the first rank. He organised an orchestra of high-class talent, and for many years conducted it in London and the provinces. He married Madam Norman Neruda (d. 1911), the celebrated violinist in 1888, and was knighted the same year.

Halley, Edmund, F.R.S. (1656–1742), English Astronomer Royal from 1720 to his death and ranked next to Newton among the scientific Englishmen of his time. Made first magnetic survey of the oceans from the naval vessel *Paramour*, 1698–1700. Discovered what is known as Halley's comet.

Hals, Franz (1584–1666), a famous painter of the Dutch School, who is represented in the leading galleries of Europe. The Wallace Collection has his world-famous picture, the *Laughing Cavalier*.

Hamilton, Alexander (1757–1804), American statesman and economist, opponent of Thomas Jefferson, served as Secretary of the Treasury in Washington's cabinet from 1789–95. Though a monarchist by predilection, he urged the adoption of the Constitution, and in conjunction with Maddison and Jay wrote the *Federalist*. *Report on Manufactures* proved a mine of arguments for future protectionists. Founded the Bank of New York. Killed in a duel with a political rival.

Hamilton, Emma Lyon, Lady (1761–1815), was a woman of humble birth and great personal beauty who attained prominent notice by her association with Sir William Hamilton, British Ambassador at Naples, who married her, and afterwards with Lord Nelson, who conceived an infatuation for her.

Hammarskjöld, Dag Hjalmar Agne Carl, D.Phil., Dr.Econ. (b. 1905), succeeded Mr. Trygve Lie in 1953 as Sec.-Gen. of the United Nations.

Hammond, John Lawrence Le Breton (1872–1949), English journalist and historian whose works on social and industrial history, written mainly in collaboration with his wife, Barbara Hammond, include *The Village Labourer*, 1911; *The Town Labourer*, 1917; *The Skilled Labourer*, 1919; *The Rise of Modern Industry*, 1925; and *The Age of the Chartists*, 1930.

Hampden, John (1594–1643), English patriot who opposed Charles I.'s "Ship Money" tax, and by his resistance and eloquent advocacy of the wish of the people helped the Parliamentary cause.

Hamsun, Knut, pen-name of **Knut Pedersen** (1859–1952), Norwegian author and farmer, who in his youth struggled for existence, visited America twice and earned his living by casual labour. His monumental work, *Markens Gröde* (*Growth of the Soil*), gained him the Nobel Prize in 1920.

Handel, George Frederick (1685–1759), German composer, son of a barber-surgeon to the Duke

of Saxony; born the same year as Bach. He spent much of his life in England composing operas and achieving world-wide fame by his magnificent series of oratorios. His operas, of which there are over forty, include *Atalanta*, *Berenice*, and *Serse*, and his oratorios, of which there are thirty-two, include *Saul*, *Israel in Egypt*, *Samson*, *Messiah*, *Judas Maccabaeus*, and *Jeptha*. He also composed chamber music, *concerti grossi*, music for chorus and orchestra, solo cantatas, harpsichord suites, and much other beautiful and noble music. Beethoven said of Handel, "Go and learn of him how to achieve great effects with simple means." Eight years before he died he became totally blind and relied upon his old friend and copyist John Christopher Smith to commit his music to paper. He was buried in Westminster Abbey.

Hannibal (247–183 B.C.), the renowned Carthaginian general, who led an army against Rome, and achieved many notable victories over superior numbers. Was defeated by Scipio at the Battle of Zama, and afterwards suffered exile, and poisoned himself.

Harcourt, Rt. Hon. Sir William Vernon, F.R.S. (1827–1904), barrister, author, Liberal statesman, an enthusiastic supporter of Mr. Gladstone.

Hardicanute (1019–1042), son of Canute the Great, was King of England from 1040 to 1042, and imposed the tax called Danegeld. He was the last Danish sovereign of this country.

Hardie, James Keir (1856–1915), a Socialist politician and Labour representative who acted as editor of the *Miner* and the *Labour Leader* from 1887 to 1904. He is regarded as the founder of the Labour Party. During his early life he worked in a Scottish coal pit, but in 1882 became a journalist, and entered Parliament as member for West Ham (South) in 1892–95, being the first Socialist to be elected to the House of Commons. First Chairman of the Parliamentary Labour Party, 1906–8, M.P. for Merthyr Tydvil from 1900 till his death.

Hardwicke, Sir Cedric Webster (b. 1893), English actor who made his debut in *The Monk and the Woman* in 1912. Has acted in many Shaw and Shakespearian plays, and is also a distinguished film actor.

Hardy, Thomas, O.M. (1840–1928), was educated as an architect and practised for some time, but became known as a promising novelist in 1871 with his story *Desperate Remedies*. In 1874 his *Far from the Madding Crowd* was published, which at once made him a name. Following that, at short intervals, came a long series of powerful novels from his pen. Perhaps the most notable of his stories are *The Trumpet Major*, *The Mayor of Casterbridge*, *Tess of the D'Urbervilles*, and *Jude the Obscure*. In 1908 he completed a dramatic poem entitled *The Dynasts*, whose central figure is Napoleon.

Hargreaves, James (1720–1778), was a poor Lancashire-born mechanic who invented the spinning jenny, one of the revolutionising labour-saving contrivances of the latter half of the 18th century. It met with much opposition, however, and kept him poor, though the community afterwards reaped the advantage in a greatly improved industry.

Harkness, Edward Stephen, B.A., M.A., LL.D. (1874–1940) was a banker and one of America's greatest philanthropists. Donor of the Pilgrim's Prize of £2,000,000 to Great Britain; founded in 1930 the Pilgrim Trust in appreciation of Great Britain's acceptance of financial burdens in the Great War of 1914–18.

Harley, Robert, 1st Earl of Oxford, K.G., P.C. (1661–1724), a distinguished Tory statesman—originally, however, a Whig—of the Queen Anne period, who fell into disgrace after that Sovereign's death in consequence of being suspected of intriguing with the Stuarts. He served at different times as Speaker of the House of Commons, Chancellor of the Exchequer, and Lord Treasurer. "The Harleian Collection" in the British Museum is a reminder of his cultured literary tastes.

Harold II. (1022–1066), the last of the Saxon Sovereigns of England, and the son of Earl Godwin, was crowned King in succession to Edward the Confessor in 1066. The coming of William the Conqueror, with his great army, soon, however, put an end to the hopes of Harold and his followers; and the Battle of Hastings terminated at once his life and Saxon sway in this country.

Haroun-Al-Raschid (763–809), the famous Caliph of Bagdad, familiar to all by the references to him in the *Arabian Nights*—a wise and powerful ruler.

Harriman, William Averell (b. 1891), adviser to Pres. Truman on defence and foreign policy and special representative in Europe of U.S. Government in connection first with the Marshall Plan and later with the Mutual Security Agency, 1948–52.

Harris, Joel Chandler (1848–1908), American journalist and author, famous as the creator of "Uncle Remus." The negro humour of his stories brought him world-wide popularity among adults and children alike. His Brer Rabbit in the Uncle Remus negro folk-tales was the forerunner of Mickey Mouse, impudently victorious in every contest against fearful adversaries.

Harrison, Frederic (1831–1923), as leader of the English Positivists, filled a prominent part in philosophical discussions during the last quarter of the 19th century. In 1907 he published *The Creed of a Layman* and *The Philosophy of Common Sense*, and in 1908 *Realities and Ideals*.

Harrison, John (1693–1776), the inventor of the chronometer, for which he received the Government grant of £20,000, was a mechanician of great ingenuity, who effected many important improvements in clocks, watches, and other instruments. In 1715 he made an 8-day clock with wooden wheels, which is still working in the Science Museum, South Kensington.

Harte, Francis Bret (1839–1902), the American poet and author, who leapt into popularity in the late 'sixties by his clever sketches and stories of Californian mining life.

Harty, Sir (Herbert) Hamilton, Mus. Doc. (1880–1941), was a well-known British composer and conductor. Conductor of Hallé Orchestra 1920–33; Musical Adviser and Conductor-in-Chief of London Symphony Orchestra 1932–41.

Harvey, William (1578–1657), an English doctor and scientist who rose to great eminence both as an anatomist and physiologist, and became Physician Extraordinary to James I. He immortalised himself by discovering the circulation of the blood in 1616.

Hastings, Sir Patrick, Q.C. (1880–1952), lawyer, politician, and playwright. Attorney-General in first Labour Government, 1924. Author of *The Blind Goddess*.

Hastings, Warren (1732–1818), the first Governor-General of India. On his return to England 12 years later he was impeached on charges of excessive cruelty and corruption. The trial lasted seven years, and cost Hastings £76,000. He was ultimately acquitted, and the East India Company settled an annuity of £4,000 upon him, and he lived to see his plans for the security of British rule in the Orient publicly applauded.

Hauptmann, Gerhart (1862–1946), one of the leading dramatic poets of Europe. Born in Silesia, he devoted himself first to agriculture, then to art, and subsequently to the drama, and lived in Rome, Berlin, Switzerland, and the United States. Produced many plays, including *The Weavers*. Winner of the Nobel Prize for Literature, 1912.

Havelock, Major-Gen. Sir Henry, K.C.B. (1795–1857), one of the heroes of the Indian Mutiny, who led the troops to the relief of Cawnpore and Lucknow.

Hawke, Edward, 1st Baron, K.C.B. (1705–1781), one of the great admirals of the 18th century. He won a brilliant victory over the French fleet at Quiberon in 1759 in a tremendous storm.

Hawkins, Sir Anthony Hope (1863–1933), a popular novelist and playwright. Amongst his best-known works were *The Prisoner of Zenda*, *The Dolly Dialogues*, and *Rupert of Hentzau*.

Hawkins, Sir John (1532–1595), a brilliant naval officer of the Elizabethan period, who did much sea fighting in many climes, and served as vice-admiral in the expedition against the Spanish Armada, for which he was knighted.

Hawthorne, Nathaniel (1804–1864), one of the most distinguished novelists that America has pro-

duced. *The Scarlet Letter* and *The Blithedale Romance* are his greatest novels.

Haydn, Franz Joseph (1732–1805), Austrian composer, who belongs to the great classical period of Bach, Handel, and Mozart and whose style also influenced Beethoven. He has been given the title "father of the symphony." Much of his life was spent as musical director to the princely Hungarian house of Esterhazy. In 1791 and again in 1794 he visited London, where he conducted his Salomon symphonies. He composed many operatic works, string quartets, symphonies (104 in all), sonatas, songs, Masses, and chamber music. His two great oratorios, *The Creation* and *The Seasons*, were written in his old age.

Hazlitt, William (1778–1830), one of the most admired of our essayists and critics. His *Characters of Shakespeare's Plays* and his published lectures on the poets and dramatists, besides his *Table Talks*, are still widely read. His son William (1811–1893) was also of literary tastes, though he became Senior Registrar in the Bankruptcy Court; and the son of the latter, William Carew Hazlitt (1834–1913), though originally a civil engineer, entered largely into journalism and authorship, and acquired celebrity as a bibliographer and numismatist, writing and editing many books.

Hearst, William Randolph (1863–1951), American newspaper proprietor who began by editing the *San Francisco Examiner* in 1887, and was until 1938 head of the largest newspaper firm in the world.

Hedin, Dr. Sven Anders, Hon. K.C.I.E. (1865–1952), a Swedish traveller who made discoveries in Central Asia, and wrote extensively thereon.

Hegel, Georg Wilhelm Friedrich (1770–1831), a famous German philosopher and professor who taught that truth or reality has three aspects revealing itself in dialectical development (Thesis, Antithesis, Synthesis) and identified reality with rationalism. He wrote many important works, among which are *The Phenomenology of the Spirit, The Science of Logic, Philosophy of Right.*

Heidenstam, Carl Gustaf Werner von (1859–1940), Swedish author and one of the most brilliant and outstanding figures in Swedish literature. Received Nobel Prize for Literature, 1916.

Heifetz, Jascha (b. 1901), Russian-born violinist who became a naturalised American. Studied with Auer in St. Petersburg. Was the first musician to win a reputation in England by gramophone records before his first personal appearance there. Is skilled in technique and a fine interpretative artist.

Heine, Heinrich (*c.* 1797–1856), the German lyric poet, who lived for the best part of his life in Paris, and produced from time to time poems of profound beauty and subtlety of thought. Cynical, satirical, and often bitter, many of his writings excited great conflict of opinion, and showed intense emotional power.

Helmholtz, Hermann Ludwig Ferdinand von (1821–94), German physiologist, physicist, and mathematician who made many important contributions to the knowledge of thermodynamics, electrodynamics, and optics. His pupil Heinrich Hertz discovered electromagnetic radiation.

Helmont, Jan Baptista van (1577–1644), Belgian chemist who devoted himself to the study of gases. His chief work is *Ortus medicinae* (1648).

Héloise (*c.* 1101–64), niece of Canon Fulbert of Notre Dame. Famed for her romantic attachment to Abelard. (*See* **Abelard.**)

Helpmann, Robert Murray (b. 1909), Australian-born actor, ballet dancer, and choreographer. Became premier danseur, Sadler's Wells Ballet, 1933, and has appeared in several films, including *Henry V* and *The Red Shoes.*

Hemingway, Ernest (*b.* 1898), American novelist and author of the three celebrated novels, *A Farewell to Arms, Death in the Afternoon,* and *For Whom the Bell Tolls.* Nobel Prize 1954.

Henderson, Rt. Hon. Arthur (1863–1935), President of World Disarmament Conference, 1932–35; Leader of the Labour Party, 1931–32; Foreign Secretary, 1929–31; Home Secretary, 1924. Awarded the 1934 Nobel Peace Prize.

Henley, William Ernest (1849–1903), English poet and journalist, a close friend of R. L. Stevenson. Was Editor of the *Scots Observer* in 1889, and later the *National Observer*, in which he first published the *Barrack-Room Ballads* of Kipling, with whose work his own has much in common.

Henrietta Maria (1609–1669), the daughter of Henry IV. of France and wife of Charles I.

Henry I. (1068–1135), youngest son of William the Conqueror, came to the throne in 1100 during the absence of his elder brother Robert on Crusade, and later had to fight and imprison the latter. He was an able administrator and a strong ruler to whom, with his grandson Henry II., we owe in a great measure the establishment of the Common Law system and many permanent administrative reforms.

Henry II. (1133–1189) was King of England from 1154 to 1189. He had serious conflicts with the Church, which were not rendered less acute by the assassination of Thomas à Becket. The story of *Fair Rosamond* is connected with this monarch.

Henry III. (1207–1272), King of England from 1216 to 1272. Was at war with his barons for the greater part of his reign, and incurred much unpopularity by his reckless living and patronage of foreign favourites.

Henry IV. (1367–1413), reigned from 1399 to 1413. The son of John o' Gaunt, he succeeded his father in the Duchy of Lancaster in 1399, and later captured and imprisoned Richard II., who was deposed by Parliament and the crown given to Bolingbroke as the grandson of Edward III. Henry IV. thus became the first of England's Lancastrian Kings.

Henry IV. of France (Henry of Navarre) (1553–1610), prior to becoming king was the leader of the French Huguenots, and although going over to the Catholics on being crowned, remained in sympathy with the Protestants and protected them by the famous Edict of Nantes. Ravaillac, a religious fanatic, assassinated Henry.

Henry V. (1387–1422), reigned from 1413 to 1422, and distinguished himself in the wars with France, the Battle of Agincourt being his greatest triumph. Is said to have been wild and dissolute in his youth, but made an able, energetic and undoubtedly courageous king.

Henry VI. (1421–1471), King of England from 1422 to 1461. Succeeding to the throne under a protectorship as a baby nine months old, he had a troubled reign, including a long war with France and loss of French possessions, the Jack Cade insurrection, and the beginning of the Wars of the Roses, which led to his deposition and the enthronement of Edward IV. by the triumphant Yorkists. Was imprisoned in the Tower, and there found dead one day in 1471. Founder of Eton and of King's College, Cambridge.

Henry VII. (1457–1509), the first of the Tudor line, reigned from 1485 to 1509, succeeding Richard III., after defeating and killing him on Bosworth Field. Was very avaricious, yet able, and accumulated vast treasure. He built the Gothic Lady Chapel of Westminster Abbey, and is there buried.

Henry VIII. (1491–1547), reigned from 1509 to 1547. A luxury-loving monarch of great diplomatic gifts, and unscrupulous to a degree when his own personal desires were concerned. His quarrels with the Church resulted in the acceptance of the Reformation. His half-dozen matrimonial exploits, his deposition of Wolsey and his suppression of the monasteries are familiar incidents of history. Less known is the foundation of the modern navy with the establishment of the Navy Office in 1546.

Henry "the Navigator" (1395–1460), a Portuguese Prince, son of John I. He discovered Madeira and the Azores, and was the chief instrument of the national impetus for navigation.

Henschel, Sir George, Mus.D. (1850–1934), English baritone singer, composer and conductor; born in Breslau, he became a naturalised Englishman in 1890. Founder and part conductor of London Symphony Concerts, 1886.

Hepplewhite, George (d. 1786). One of the four great English 18th-century cabinet-makers. He was a contemporary of Chippendale, Robert Adam and Sheraton. His name is identified with the style of furniture which followed the Chippendale period.

Heraclitus (*c.* 535–475 B.C.), a Greek philosopher, chiefly famous for his doctrine that everything

is in a state of flux. He regarded fire as the primordial element.

Herbert, George (1593–1633), the most purely devotional of English poets.

Hereward the Wake, the last of the Saxon nobles to hold out against the Normans. Taking refuge in the Fen country, he long defied the Conqueror's forces, but was at last betrayed into the enemy's hands by monks. William afterwards honoured him with a place at Court.

Herod the Great (*c.* 73–4 B.C.), the tyrannical king of Judæa who secured the title from Marc Antony in 37 B.C. This was the Herod who was ruling when Christ was born and who ordered the massacre of the Innocents.

Herodotus (*c.* 485–425 B.C.), the great Greek historian, called by Cicero the father of history. Has also been called the father of anthropology.

Herrick, Robert (1591–1674), an English lyric poet, unrivalled in his own field. Author of *Gather ye Rose Buds*, *Cherry Ripe*, *Oberon's Feast*, etc.

Herriot, Edouard (1872–1957), French statesman; Pres. of the National Assembly, 1947–54. A much-travelled scholar, Mayor of Lyons for more than a generation, three times Prime Minister, and the recognised spokesman of the Left-Centre party, which was for so long dominant in French politics.

Herschel, Sir John Frederick William, Bt., F.R.S. (1792–1871), a celebrated astronomer who did much to extend the power of the telescope.

Herschel, Sir William, F.R.S. (1738–1822), great astronomer, father of the last-named, discovered the planet Uranus. His sister, **Caroline Lucretia** (1750–1848), was the author of *Index to Flamsteed's Observations of the Fixed Stars* and *Errata*.

Hertz, Heinrich (1857–1894), German physicist whose laboratory experiments confirmed Maxwell's electromagnetic theory of waves.

Herzl, Theodor (1860–1904), founded modern political Zionism.

Hesiod (*floruit c.* 735 B.C.), ancient Greek nature poet, author of the poems *Work and Days*, which tells of life in the country.

Hewart, 1st Viscount, P.C. (1870–1943), Lord Chief Justice of England, 1922–40.

Hill, Octavia (1838–1912), a noted pioneer English social reformer who took a practical interest in the housing conditions of the poor, and a pioneer in slum clearance in London. Helped to institute the Charity Organisation Society, and was one of the first women to sit on a Royal Commission.

Hill, Sir Rowland, K.C.B., F.R.S. (1795–1879), the first propounder of the idea of the penny postal system, and secretary to the Postmaster-General from 1846 to 1854, after which he was Chief Secretary to the Post Office until 1864.

Hindemith, Paul (b. 1895), German composer and violinist belonging to the anti-romantic or neo-classical school. Much of his work is *Gebrauchsmusik* (workaday music written with the aim of establishing closer contact between composer and public). His works are numerous and strikingly varied, and include sonatas and chamber works, songs, operas, ballet music, Symphony in E flat, and the oratorio *Das Unaufhörliche*. Formerly Prof. of Music Yale Univ.; Prof. of Musical Theory, Univ. of Zurich, 1952–.

Hindenburg, Field-Marshal Paul von (1847–1934). President of the German Reich, 1925–34; Chief of the General Staff, 1916–18.

Hinshelwood, Sir Cyril Norman, M.A., D.Sc., F.R.S. (b. 1897), Pres. of the Royal Society and Dr. Lee's Prof. of Chemistry, Univ. of Oxford, 1937–. Shared with Prof. Semenov of Russia the 1956 Nobel Prize for Chemistry for researches into the mechanism of chemical reactions.

Hinton, Sir Christopher, K.B.E., M.A., D.Eng., D.Sc.(Eng.), F.R.S. (b. 1901), as Man. Dir. of the Industrial Group of the U.K. Atomic Energy Authority played important part in the building of Calder Hall. Appointed in 1957 Chairman Central Electricity Generating Board which owns and operates Britain's nuclear power stations.

Hippocrates of Chios (fl. *c.* 430 B.C.), a Greek business-man who specialised in mathematics and was the first to compile a work on the elements of geometry.

Hippocrates of Cos (*c.* 460–*c.* 370 B.C.), Greek physician, the father of medicine, b. on the island of Cos off the coast of Asia Minor. He established medical schools in Athens and elsewhere and separated medicine from superstition and so placed it on a scientific basis.

Hirohito, Emperor of Japan (b. 1901), acceded to the throne Dec. 1926.

Hitler, Adolf (1889–1945). Dictator of Germany, 1933–45. Born in Austria, son of Customs official. Worked in Vienna as artisan: already held anti-semitic and anti-marxist views. Came to Munich in 1912; enlisted in Bavarian Infantry at outbreak of first world war. At the end of the war conditions in Germany favoured the growth of a fascist movement and under his personal leadership the National Socialist (Nazi) Party climbed to power. Appointed Reich Chancellor, 1933. On death of Hindenburg in 1934 became Führer. Commander-in-Chief Wehrmacht, 1935. Under the Hitler regime working class movements were ruthlessly destroyed; all opponents—communists, socialists, Jews—were persecuted and murdered. By terrorism and propaganda the German state was welded into a powerful machine for aggression. There followed the occupation of the Rhineland in 1936, the annexation of Austria and Czechoslovakia in 1938 and 1939, the invasion of Poland and declaration of war by Great Britain and France in Sept. 1939, the invasion of Soviet Russia in 1941. Final defeat came in 1945 and on April 30 Hitler committed suicide in the Chancellery as the Russians closed in on Berlin.

Hobbes, Thomas (1588–1679), English philosopher who published his most famous work, *Leviathan*, in 1651. He favoured strong Government and therefore supported the supremacy of the State even in religion, but his arguments aroused great antagonism even among the Royalists. He was a child of his age in his enthusiasm for scientific enquiry, and his works provoked fresh thought on many sides.

Hobbs, Sir John Berry ("Jack") (b. 1882), first played for Surrey 1905; retired from first-class cricket Feb. 1935. Scored 61,221 runs including 197 centuries.

Hobhouse, Leonard Trelawney (1864–1929), English sociologist, who, after a brilliant career at Oxford, joined the staff of the *Manchester Guardian* in 1897, and became in 1908 editor of the *Sociological Review*. His book *The Theory of Knowledge* established his reputation in 1896, and was sustained by *Mind and Evolution*, 1901, and *Morals in Evolution*, 1906. His greatest work was *Development and Purpose*, 1913.

Ho Chi-minh (b. 1892), leader of the Vietnam revolutionary nationalist party of Indo-China. Successfully led the struggle for independence during and after the second world war. President of North Vietnam.

Hogarth, William (1697–1764), the celebrated engraver and painter who satirised the follies of his time in a series of engravings instinct with character, humour and power. His *Harlot's Progress*, of six engravings, was published in 1734, and gained him immediate fame. In 1735 he produced his equally celebrated *Rake's Progress*, a series of eight engravings. These were followed by numerous others, including *Marriage à la Mode*, *Industry and Idleness*, and *The March to Finchley*.

Hogben, Lancelot, D.Sc., F.R.S. (b. 1895), physiologist; Professor of Natural History, Univ. of Aberdeen 1937–41; Prof. of Social Biology, Univ. of London, 1930–37. Author of *Mathematics for the Million* and *Science for the Citizen*.

Hogg, James (1770–1835), a Scottish poet of force and originality.

Hogg, Quintin (1845–1903), was an educationist and philanthropist who, purchasing the old Polytechnic Institution in 1882, turned it into a popular college, providing efficient instruction in every department of education at moderate rates.

Hokusai, Katsushika (1760–1849), Japanese artist of the Ukiyo-e (popular school), whose work is highly original and of singular beauty and delicacy. He excelled in landscapes.

Holbein, The Elder (*c.* 1460–1524), a famous German painter, father of Hans Holbein.

Holbein, Hans—The Younger (1497–1543), was born at Augsburg, and settled in London in 1530, where he won the favour of Henry VIII, for whom he painted many portraits, and produced the famous *Dance of Death*.

Holden, Charles, F.R.I.B.A. (b. 1875), British architect, designer of modern public buildings, including British Medical Assen. Building, Strand, London Underground Railway Head Offices, Piccadilly Circus, new Univ. of London buildings, Bloomsbury.

Holden, Sir Isaac, Bt. (1807–1897), an inventor and manufacturer who achieved fame and fortune in connection with wool-combing inventions. He was in Parliament from 1865 almost to the time of his death, and was made a baronet in 1893.

Hölderlin, Johann Christian Friedrich (1770–1843), friend of Hegel and contemporary of, though unappreciated by, Goethe and Schiller, he is now considered among the very greatest of German poets. His mind became unhinged in his middle years and was finally overcome by schizophrenia.

Holford, Sir William Graham, M.A., F.R.I.B.A. (b. 1907), British architect and town-planner. Prof. of Civic Design, Univ. of Liverpool, 1936–47; Prof. of Town Planning, London Univ., 1949–; planned post-war redevelopment of City of London, including precincts of St. Paul's Cathedral.

Holland, Rt. Hon. S. G., C.H. (b. 1893), New Zealand Conservative leader; Prime Minister, 1949–57.

Holmes, Oliver Wendell (1809–1894), an American doctor and author of great humour and geniality. His *Autocrat of the Breakfast Table*, *The Professor at the Breakfast Table* and *The Poet at the Breakfast Table* are works of infinite humour and quaintness. He was also the author of three novels.

Holst, Gustav Theodore (1874–1934), a British composer of Swedish descent whose compositions include *The Planets* suite, *The Hymn of Jesus*, an opera *The Perfect Fool*, and a choral symphony. Professor of Music and Music Master at St. Paul's Girls' School, London, 1905–34. Director of Music at University College, Reading, 1919–23.

Holyoake, George Jacob (1817–1906), an eminent secularist lecturer and author, who was identified with many popular movements, especially Co-operation, of which he was the historian.

Homer (*c.* 700 B.C.), the most famous of all epic poets. Is supposed to have been a Greek who lived probably at Chios or Smyrna, and has generally been regarded as the author of the *Iliad* and the *Odyssey*, though tradition rather than ascertained fact connects his name with those great poems.

Hood, Samuel, 1st Viscount Hood of Whitley, G.C.B. (1724–1816), a successful British admiral, who in 1793 was in command of the Mediterranean fleet, and showed great capacity in that post, taking and occupying Toulon, and capturing Corsica among other exploits.

Hood, Thomas (1799–1845), an English poet, who, as a prolific writer of serious as well as humorous poems, stands in his own line unique. Of his serious verse, *The Song of the Shirt*, *The Dream of Eugene Aram* and *The Bridge of Sighs* may be cited as the best examples, while his comic poems, notably those of the punning order, are unequalled.

Hooke, Robert (1635–1703), English physicist, a great experimenter and inventor. He was also an architect and drew up a plan for rebuilding London after the Great Fire.

Hooker, Richard (1554–1600), was Master of the Temple from 1585–91, and afterwards Rector of Boscombe. Is famed for his great book on *Ecclesiastical Polity*, and because of his exquisite choice of words, was known as "Judicious Hooker."

Hopkins, Sir Frederick Gowland, O.M., F.R.S. (1861–1947), an eminent English bio-chemist, noted for his important work on proteins and vitamins. In 1929 was awarded the Nobel Prize in Medicine for his discovery of Vitamin D. Pres. of the Royal Society 1931–36, and of the British Association, 1933.

Hopkins, Harry (1890–1946), Franklin Roosevelt's personal assistant. Particularly assisted the President at the important war-time foreign conferences, as his personal representative abroad, in working out the New Deal, and in the administration of Lend-Lease.

Hopkinson, John, D.Sc., F.R.S. (1849–98), English engineer and physicist. Senior Wrangler and Fellow at Cambridge. Studied engineering in his father's works, and set up as a consultative engineer. Specialised in electrical work, and by developing the theory of alternating current and of the magnetic current in dynamos he paved the way to the common use of electricity in daily life. Was Professor of Electrical Engineering at King's College, London, 1890–98.

Hoppner, John, R.A. (1758–1810), English portrait painter born in Whitehcapel of German parents; studied at the Academy Schools, winning great distinction and painted portraits of many members of the Royal Family.

Horace, or more properly **Flaccus Quintus Horatius** (65–8 B.C.), the famous Roman satirist and poet, who was the friend of Virgil, and attained immortal fame by his *Satires*, *Epodes*, and *Odes*.

Horner, Arthur (b. 1894), general secretary of the National Union of Mineworkers 1946–59 and a leading British Communist.

Horniman, Annie Elizabeth Fredericka, C.H. (1830–1937). English theatre manager and founder of the repertory system in England. She was the daughter of F. J. Horniman, the traveller and collector, who founded the Horniman Museum in Forest Hill and presented it to the L.C.C. in 1901.

Houdini, Harry (1873–1926), the famous American entertainer, who was a locksmith, but went on the variety stage as an expert in escaping from handcuffs, locked chambers, etc. A keen student of psychic manifestations, and in his day was one of the world's greatest illusionists.

Housman, Laurence (1865–1959), English playwright, poet, and novelist, younger brother of **Alfred Edward** (1859–1936) also a poet of distinction, a professor of Latin at Cambridge and an eminent classical scholar, author of *A Shropshire Lad*.

Howard, John (1726–1790), earned celebrity for his philanthropic efforts on behalf of prison reform, the pursuit of which eventually exposed him to a fatal fever attack in Russia.

Howard of Effingham, Lord (1536–1624), commander of the fleet which defeated the Spanish Armada, 1588, and took part in the capture of Cadiz, 1596.

Howe, Elias (1819–1867), an ingenious American who was the inventor of the first sewing machine, by which he made a great fortune.

Howe, Julia Ward (1819–1910), American philanthropist and poetess, famous as the authoress of the *Battle Hymn of the Republic* (1861), a leader of the American Suffragette movement, and the first woman to be elected to the American Academy of Arts and Letters.

Howe, Richard, 1st (and last) **Earl** (of first creation), K.G. (1726–1799), the British admiral who in 1758 destroyed Cherbourg and in 1794 won the famous victory over the French off Brest.

Howells, William Dean (1837–1920), American novelist and author.

Hubble, Edwin Powell, B.Sc., Ph.D. (1889–1953), U.S. astronomer at Mount Wilson Observatory from 1919 until his death. Noted for his work on extragalactic nebulæ and with the aid of the 200-in. telescope at Mount Palomar made important discoveries.

Hudson, Henry (*c.* 1550–1611), was a famous English navigator who discovered the Hudson River, Hudson Strait and Bay, and his two books describing his voyages are of the greatest interest.

Hudson, William Henry (1841–1922), English author and naturalist, who spent his early years in South America, memories of which influenced much of his work. His books include *The Purple Land* (1885), *Green Mansions* (1904), *Afoot in England* (1909) and *British Birds* (1895). The Hyde Park Bird Sanctuary (opened in 1925) was established in his memory, and contains the famous figure of *Rima* by Epstein.

Huggins, Sir William, O.M., K.C.B., F.R.S. (1824–1910), British astronomer who pioneered in spectroscopic photography. Collaborated with his wife, **Margaret Lindsay Murray** (1848–1915), who was also an able astronomer.

Hughes, Thomas (1822–1896), educated at Rugby and at Oxford; practised at the Bar, and became a County Court Judge in 1882. His best-known work is *Tom Brown's Schooldays*.

Hugo, Victor Marie (1802–1885), the great poet, dramatist and novelist who headed the Romantic movement in France in the early part of the 19th century and made himself a name of the

first eminence by his various writings. His dramas of *Hernani*, *Lucrèce Borgia*, *Ruy Blas*, and *Le Roi s'amuse* were in every sense great triumphs. Among his novels, *Notre Dame* belongs to his early period, and *Les Misérables*, *Les Travailleurs de la mer*, and *L'Homme qui rit*, belong to his later life, written while he was living in exile in Guernsey.

Hull, Cordell (1871–1955), U.S. Sec. of State, 1933–44. Awarded the Nobel Peace Prize, 1945.

Humboldt, Baron Friedrich Heinrich Alexander von (1769–1859), the great German traveller and naturalist; his books describing his travels and scientific discoveries—especially in geology and natural history—are most attractive.

Hume, David (1711–1776), the celebrated historian and philosopher whose *History of England* long held chief place in English historical literature. But Hume's enduring fame rests upon his philosophical writings. He developed the empiricism of Locke into the scepticism inherent in it. His main works are *Treatise of Human Nature* and *Dialogues Concerning Natural Religion*.

Hunt, Brig. Sir (Henry Cecil) John, Kt., C.B.E., D.S.O. (b. 1910), soldier and mountaineer; leader of the successful 1953 British Mount Everest Expedition. The story of the climb is told in his book *The Ascent of Everest*.

Hunt, (James Henry) Leigh (1784–1859), an English poet, politician and essayist. In 1813 he was fined £500, and sentenced to two years' imprisonment for libelling the Prince Regent, and while in prison wrote his poem, *The Story of Rimini*, and other works. In later life he was a constant contributor to literature, and from 1847 enjoyed a pension of £200 a year from the Civil List.

Hunt, Wm. Holman, O.M. (1827–1910), one of the three founders of the Pre-Raphaelite movement, and an artist who achieved distinction by several remarkable paintings, the chief of which is, perhaps, *The Light of the World*, an allegorical work.

Hunter, the brothers **William**, F.R.S. (1718–83) and **John**, F.R.S. (1728–93), were both famous Scottish physicians. William had remarkable success as a lecturer and obstetrician. His valuable anatomical collection was bequeathed to the Univ. of Glasgow. John showed real genius for anatomy, became one of the greatest surgeons of his day and made many discoveries. His surgical museum forms part of the Museum of the Royal College of Surgeons.

Huss, or Hus, John (1369–1415), the Bohemian religious reformer, was strongly influenced by Wyclif and himself urged reform both of abuses in the church and of doctrine. Sentenced to death or recantation he suffered martyrdom on July 6, 1415. His death caused a civil war which lasted for many years.

Hussein ibn Talal (b. 1934), grandson of King Abdullah, succeeded his father Talal as King of Jordan, Aug. 11, 1952.

Hutton, James, M.D. (1726–97), an Edinburgh doctor whose geological researches established the fundamental principles of modern geology. Before his time geology did not exist as a science, all was speculation. He drew his evidence from the rocks themselves, and his *Theory of the Earth* is one of the great classics of science.

Huxley, Aldous (Leonard) (*b.* 1894), noted modern writer, grandson of T. H. Huxley and brother of Julian; author of *Crome Yellow*, *Jesting Pilate*, *Brave New World*, *Point Counter Point*, *Ends and Means*, *Grey Eminence*, *The Perennial Philosophy*, etc.

Huxley, Sir Julian Sorrell, M.A., F.R.S. (b. 1887), biologist and writer, grandson of T. H. Huxley. Director-General of the United Nations Educational, Scientific and Cultural Organisation 1946–48. Secy. of Zoological Soc. of London 1935–42.

Huxley, Thomas Henry, F.R.S. (1825–1895) an eminent scientist and author of numerous works covering a great range of research. After the publication of Darwin's *Origin of Species*, Huxley became an ardent evolutionist. His biological work, *Man's Place in Nature*, and his numerous essays were marked by great vigour and clearness of thought, and gave him a leading position. He held numerous important appointments, was President of the Royal Society in 1883, and belonged to many learned societies.

Hyde, Dr. Douglas (1860–1949), the distinguished Irish scholar, historian, poet and folk-lorist. President of Eire, 1938–45.

Hypatia of Alexandria, the only woman mathematician of antiquity. She excited the enmity of Christian fanatics, who raised an agitation against her, and she was put to death in A.D. 415

I

Ibáñez, Vicente Blasco. (*See* **Blasco-Ibáñez, Vicente.**)

Ibrahim Pasha (1789–1848), an able Egyptian statesman, general, and Viceroy, who, adopted by Mohammed Ali as his son, contributed largely to the success of Egyptian policy during the quarter of a century or more of his influence. His conquest of Syria was a notable feat of generalship. He died a few months after being appointed Viceroy.

Ibsen, Henrik Johan (1828–1906), the Norwegian playwright and poet, moralist, and humanist, whose plays, though arousing considerable opposition at the time, are acknowledged as the work of one of the world's greatest dramatists. A master of technique, charging every detail with significance, fusing the comic with the tragic, Ibsen revolutionised the European theatre. His chief works are *Ghosts*, *The Master Builder*, *The Wild Duck*, *A Doll's House*, *Hedda Gabler* and the poetic drama *Peer Gynt*.

Inge, Very Rev. William Ralph, K.C.V.O., D.D. (1860–1954), English divine; Dean of St. Paul's, 1911–34; Assistant Master at Eton, 1884–88; Lady Margaret Prof. Camb., 1907–11. Earned the sobriquet "the gloomy Dean" for his incisive and somewhat pessimistic comments on contemporary affairs. His books include a number on mysticism.

Ingersoll, Robert Green (1833–99), American lawyer, writer, and lecturer, became known by reason of his lectures directed principally against Christianity.

Ingres, Jean Auguste Dominique (1780–1867), a great French historical painter who was elected to the Institute in 1824, and at his death was a Senator of France.

Innocent III. (1160–1216), Pope from 1198, successfully asserted the power of the papacy over such secular princes as the emperor, Philip II. of France, and John of England. He promoted the 4th Crusade, initiated the crusade against the Albigensian heretics, and held the 4th Lateran Council. His pontificate marks the zenith of the medieval papacy.

Inönü, General Ismet (b. 1884), President of Turkey 1938–50. Was Minister for Foreign Affairs and Prime Minister in 1923; Prime Minister 1924–27 and 1927–37.

Ireland, John, Hon. D.Mus. (b. 1879), English composer, best known for his setting of Masefield's *Sea Fever*, his chamber music, his 'cello and pianoforte sonata, and especially sonata for pianoforte and violin.

Irving, Sir Henry (1838–1905), a great English actor who made his first appearance in London in 1866 and whose first distinct success was as Digby Grant in *Two Roses*. His record at the Lyceum Theatre from 1871 onwards covered a brilliant series of productions, including *The Bells*, his first triumph, *Charles I.*, *Eugene Aram*, and a number of Shakespearean impersonations, in some of which, notably Shylock and Hamlet, Irving gave memorable performances.

Irving, Washington (1783–1859), a writer of charming stories and miscellaneous works which won wide and well-deserved favour on both sides of the Atlantic. Among his biographical books may be mentioned Lives of Goldsmith, Columbus, Mohammed and Washington.

Isabella of Castile (1451–1504), reigned jointly with Ferdinand V., her husband. During their thirty years' sway Spain was united as a single monarchy, and achieved the height of its greatness, the discovery of America, the conquest of Granada, and the expulsion of the Moors from Spain being among the events of her reign.

Ismail Pasha (1830–95), grandson of Mohammed Ali, was a man of modern ideas and great public spirit, whose policy rendered Egypt practically

independent of Turkey, the Sultan confirming him in the position and title of Khedive in 1873. It was his adoption of the idea of the Suez Canal that enabled that work to be successfully carried out. By reckless extravagance he involved himself in difficulties, entailing the sale of his Suez Canal shares to England, the establishment of the dual control of England and France, and his own abdication in 1879, when his son Tewfik succeeded.

Israels, Joseph (1824–1911), outstanding Dutch genre painter of the 19th century.

Ito, Hirobumi, Prince (1841–1909), one of the most enlightened statesmen of Japan. The unparalleled social metamorphosis which Japan underwent in the latter half of the nineteenth century owed much to his guidance and influence. Was four times Premier.

Ivan the Great (1440–1505), succeeded in bringing the scattered provinces of Muscovy under one supreme governmental control, and put an end to Tartar rule.

Ivan the Terrible (1530–84), crowned as first Czar of Russia in 1547, was a strong and autocratic ruler. He furthered internal consolidation and Russian eastward expansion and entered into trading relations with Queen Elizabeth.

J

Jacks, Lawrence Pearsall (1860–1955), Principal of Manchester College, Oxford, 1915–31, and Professor of Philosophy in that College, 1903–31. Entered ministry in 1887 as assistant to the Rev. Stopford Brooke. Editor of the *Hibbert Journal*, 1902–47, and author of several books of religious studies.

Jackson, Andrew (1767–1845), American general who was twice President of the United States.

Jackson, Thomas Jonathan (1824–1863), popularly known as "Stonewall Jackson," was the most brilliant general on the Southern side in the American Civil War. Was accidentally killed at the Battle of Chancellorsville. The term "Stonewall" refers to his dogged resistance at the first Battle of Bull Run.

Jacobs, William Wymark (1863–1943), novelist of quaint and peculiar humour, whose stories and sketches of East End riverside life are inimitable.

Jacquard, Joseph Marie (1752–1834), a French mechanic whose Jacquard loom provided a new and effective method of weaving designs in textile fabrics, and was an invention of the very first rank.

Jagellons, Lithuanian-Polish dynasty, ruled in Poland 1386–1572.

James I. (1566–1625), King of England (1603–25) and, as James VI., King of Scotland (1567–1625). He was the son of Mary Stuart and succeeded to the English throne on the death of Elizabeth. Numerous plots were formed against him, including the Gunpowder Plot of 1605. He persecuted the Puritans, granted many monopolies, and saw the Authorised Version of the Bible published. Described by Henry IV of France as "the wisest fool in Christendom."

James II. (1633–1701) King of England and, as James VII., of Scotland (1685–88), second son of Charles I. As Duke of York he was Lord High Admiral in the Second and Third Dutch Wars, during which New Amsterdam fell to England and was renamed New York. As a Roman Catholic he resigned his office after the Test Act of 1673, was nearly excluded from the Succession, and, when he came to the throne in 1685, aroused and united strong opposition by his attempts to obtain better conditions for his co-religionists. The unsuccessful Monmouth Rebellion, the Bloody Assize, the Declaration of Indulgence, and the Seven Bishops' Trial marked a reign which ended in the flight of the King and the Revolution Settlement of 1689.

James, Henry, O.M. (1843–1916), an Anglo-American novelist and younger brother of William James. Produced a number of notable stories, remarkable for their intellectual subtlety and careful characterisations. For the last thirty years of his life he resided mostly in London. His best-known novels are *The American*, *Daisy Miller*, *The Bostonian*, *The Portrait of a Lady* and *What Maisie Saw*. Became a British subject 1915.

James, William (1842–1910), the great American psychologist and philosopher, brother of Henry James, the novelist. He became Prof. of Philosophy at Harvard University, 1882, and was the founder of the philosophical system known as pragmatism. His first important work, *Principles of Psychology*, 1890, stamped him as one of the most lucid, penetrating and engaging writers of his day, and established him as the foremost protagonist of the physical school in psychology. *Pragmatism*, a new name for some old ways of thinking, appeared in 1907, and established him as a speculative philosopher of a high order.

Jeans, Sir James Hopwood, O.M., F.R.S. (1877–1946), a brilliant mathematician and astronomer who was a lecturer in mathematics at Cambridge and Princeton and secretary of the Royal Society, 1919–29. Author of *The Universe Around Us*, *The Mysterious Universe*, etc.

Jefferies, Richard (1848–1887), an English naturalist, who, between 1873 and the time of his death, wrote some of the most beautiful descriptions of natural scenery and the customs and habits of the rural world that we possess. His *Gamekeeper at Home* and *The Life of the Fields* are books of great power and sympathy.

Jefferson, President Thomas (1743–1826), took part in the American Revolution, and drew up the Declaration of Independence. Twice U.S. Pres.

Jeffreys, George, 1st Baron of Wem (1648–1689), won for himself unenviable notoriety by his harsh and cruel judgments, when he held what is known as the "Bloody Assize." He was made Lord Chancellor, but after the fall of James II. was sent to the Tower and there died.

Jellicoe, Adml. of the Fleet, Earl, G.C.B., O.M., G.C.V.O. (1859–1935), Commander-in-Chief of British Fleet, August 1914 to Nov. 1916; and First Sea Lord, Nov. 1916 to Dec. 1917 Gov.-Gen. of New Zealand, 1920–24.

Jenghiz Khan (1162–1227), the famous Mogul ruler who twice conquered China, and forced the Turks within European confines.

Jenner, Edward, M.D., F.R.S. (1749–1823), an English physican who became celebrated by his discovery of the vaccination system of alleviating smallpox, which has been of such incalculable benefit to mankind. Parliament made him grants amounting to £30,000 which left him still out of pocket.

Jerome, Jerome Klapka (1859–1927), a clever journalist and writer, who made his first success with his humorous book, *Three Men in a Boat*. He founded *The Idler*.

Jerome, St. (340–420), a noted theologian of the 5th century, whose Latin translation of the Scriptures (*The Vulgate*) made him famous. He died at Bethlehem.

Jerrold, Douglas William (1803–1857), playwright and humorist, who enjoyed a long career of success by his contributions to *Punch* (including *Mrs. Caudle's Curtain Lectures*); his play *Black-Eyed Susan* was an enormous success.

Jesus Christ (*c.* 4 B.C.–A.D. 30 or 33), the founder of Christianity and the greatest figure of human history. The main source of information on His life and work is the New Testament. Jesus was born at Bethlehem in Judea, and was the first-born of His mother Mary. According to Matthew, He was miraculously conceived and Joseph was His foster-father. The family home was at Nazareth in Galilee. Jesus lived at a critical period in Jewish history. He began His three-year mission when He was about thirty. His teaching is summarised in the Sermon on the Mount.

Jiménez, Juan Ramón (b. 1881), Spanish lyric poet who was awarded the Nobel Prize for Literature in 1956.

Jinnah, Mohammed Ali (1876–1948), Indian statesman. The emergence of a separate Moslem state of Pakistan when the British left India was mainly due to his efforts. He was for many years the active President of the Moslem League, and in 1947 became the first Gov.-Gen. of Pakistan. He was a barrister by profession.

Joachim, Joseph (1831–1907), Hungarian violinist and composer of the classical-romantic school of Mendelssohn, Schumann, and Brahms. He

ranks as the greatest solo violinist the world has ever known.

Joan of Arc, St. (1412–1431), the girl whose heroism inspired the French to drive the English out of Orleans, and enabled Charles to be proclaimed King at Rheims. She was burned as a heretic at Rouen. Canonised at St. Peter's, Rome, 1920.

Joffre, Marshal Joseph Jacques Césaire, G.C.B., Hon. O.M. (1852–1931), Commander-in-Chief of the French Armies 1911–17. His handling of his troops during the war was eminently successful. Entered the Army in 1870, and commanded a battery during the siege of Paris.

John, St., the Baptist (executed A.D. 28), the forerunner of Christ.

John, St., the Evangelist, the son of Zebedee, retired to Patmos after the Crucifixion, but returned from exile to Ephesus later, and there died at a great age, probably *circa* A.D. 99.

John, surnamed **"Lackland"** (1167–1216), King of England from 1199 to his death at Newark after deposition by the Barons in 1216. One of the most detested of English monarchs, but whose reign stands out large in history because of his having granted, under compulsion, the Magna Carta, England's great bulwark of liberty.

John of Gaunt (1340–1399), Duke of Lancaster, son of Edward III. and father of Henry IV., was one of the most powerful English nobles, and was more or less concerned in the leading events of his time. In Wat Tyler's rebellion he had his palace in the Savoy destroyed and was long held in popular hatred.

John, Augustus Edwin, O.M., R.A. (b. 1878), outstanding British painter, especially notable for his portraits. Among others, he has painted Lloyd George, Bernard Shaw, and T. E. Lawrence. His works in the Tate Gallery include *The Smiling Woman* and *Galway*.

Johnson, Amy, C.B.E. (1904–1941), was the first woman aviator to fly solo from England to Australia, when she made a record flight to India (6 days to Karachi). Lost her life when flying as a pilot of the Air Transport Auxiliary over the Thames Estuary.

Johnson, Very Rev. Hewlett, M.A., B.Sc., D.D. (b. 1874), Dean of Canterbury since 1931. Publs. *The Socialist Sixth of the World, Soviet Strength, Soviet Success.*

Johnson, Dr. Samuel (1709–1784), the great lexicographer and writer, who for a number of years was the most prominent literary man in England. His *Dictionary* was published in 1755, before which he had attained eminence by several works including the *Vanity of Human Wishes*. His *Rasselas* appeared in 1759, and for two years he published *The Idler*, a collection of essays after the style of the *Spectator*. His *Lives of the Poets* appeared in 1781. He was greatly honoured during his life, enjoyed a pension of £300 a year from 1762, at his death was buried in Westminster Abbey, and had the best biography in the language written upon him by James Boswell.

Johnston, Sir Harry (Hamilton), G.C.M.G., K.C.B. (1858–1927), was a daring and successful explorer, who led scientific expeditions into the interior of Africa. Helped to crush the Arab slave trade in East Africa and to establish a large British Protectorate north of Lake Tanganyika. Published many valuable works of travel and observation and also a *History of the British Empire in Africa.*

Jókai, Maurus (1825–1904), a distinguished Hungarian novelist, many of whose works have been translated into English, among them *A Modern Midas* and *Black Diamonds.*

Joliot-Curie, Jean Frédéric (1900–58), French physicist. His wife **Irène** (1896–1956), daughter of Pierre and Marie Curie, was also a distinguished scientist. Their discovery of artificial radioactivity brought them a Nobel Prize in 1935. Both were dismissed from the French Atomic Energy Commission because of their sympathy for communism.

Jones, Ernest Charles (1819–69), one of the best-known leaders of the Chartist movement, was sentenced in 1848 to two years' imprisonment for his revolutionary speeches. He was also a political writer and the author of several poems.

Jones, Sir Harold Spencer, K.B.E., F.R.S. (b. 1890) Astronomer Royal, 1933–55; H.M. Astronomer Cape of Good Hope, 1923–33; Pres. Horological Inst. Author of *General Astronomy, Worlds Without End, Life on Other Worlds.*

Jones, Inigo (1573–1652), a noted architect, who became known as "the English Palladio," and built, among other famous structures, the Banqueting Hall at Whitehall and the gateway of St. Mary's at Oxford. He was a Royalist, and suffered severely in the Civil War.

Jones, John Paul (1747–1792), was a Scotsman, who early in life took to the sea, and during the American War of Independence commanded various ships on behalf of the Colonists, and was most daring in his onslaughts upon British vessels. He died in Paris.

Jonson, Ben (1573–1637), a friend of Shakespeare and one of the great poets and dramatists of his age. Was Poet Laureate from 1619. His best plays are *Every Man in his Humour* and *The Alchemist.* Buried in Westminster Abbey.

Josephine, Empress (1763–1814), was the wife of Napoleon I. until he divorced her in 1809 and married Marie Louise. Josephine had previously been married to Vicomte Alexandre Beauharnais, by whom she had two children.

Josephus, Flavius (A.D. 38–*c.* 100), Jewish historian whose *History of the Jewish War* and *Antiquities of the Jews* contained much valuable historical evidence bearing upon Biblical history.

Joule, James Prescott, F.R.S. (1818–1889), one of the greatest of English physicists, famous for his researches on electro-magnetism and for his determination of the mechanical equivalent of heat.

Jowett, Benjamin (1817–93), English scholar remembered as the greatest Master of Balliol College, winning a great reputation for his sympathy and erudition. His outstanding works include translations of the *Dialogues of Plato* and *History of Thucydides*. His Mastership raised Balliol to a proud pre-eminence among the Colleges.

Jowitt, William Allen, Earl, P.C. (1885–1957), Lord High Chancellor in the Labour Governments, 1945–51. Pub. *The Strange Case of Alger Hiss* (1953).

Joyce, James (1882–1941), Irish author who because of the originality, daring, and range of his work exercised a great influence on the younger school of novelists, critics, and poets. Notable among his works are *Portrait of the Artist as a Young Man, Ulysses,* and *Finnegans Wake.*

Juin, Alphonse, Marshal of France (b. 1888), C.-in-C. of French troops in N. Africa, 1942; Res.-Gen. in Morocco, 1947–51; C.-in-C. Allied Forces, Central Europe (NATO), 1951–56.

Julian the Apostate (Flavius Claudius Julianus) (331–363) was Roman Emperor for the last two years of his life, during which period he was an avowed pagan, though previously he had professedly been a Christian. He was slain by an arrow during an expedition against Persia.

Julius Cæsar, (See **Cæsar Caius Julius.**)

Jung, Carl Gustav (b. 1875), Swiss psychiatrist, founder of the Zür School, and a former pupil of Freud (*q.v.*) until 1911, when he formulated a system of analytical psychology.

Junot, Andoche, Duc d'Abrantès (1771–1813), one of Napoleon's great generals, brilliantly successful until defeated by Wellington at Vimeiro.

Jusserand, Jean Adrien Antoine Jules (1855–1932), French author and diplomat; Ambassador to U.S.A., 1902–25. A well-known authority on English literature, his works include *The English Theatre from the Conquest to Shakespeare* (1878), *The English Novel* (1886), *The Literary History of the English up to the Renaissance* (1894).

Justinian I. (Flavius Anicius Justianianus) (483–565) was the Roman Emperor of the East whose fame rests chiefly on his laws. His *Corpus Juris Civilis* remained the accepted text-book of Roman Law to the end of the 9th century, and is still the most important of all monuments of jurisprudence. He reigned from 527 to 565.

Juvenal (Decimus Junius Juvenalis) (60–140), the famous Roman poet and rhetorician of the age of Trajan. His sixteen celebrated *Satires* are the finest in classical literature.

K

Kafka, Franz (1883–1924), Jewish writer, born in Prague, whose introspective work, the bulk of

which was not published till after his early death from tuberculosis, has been widely acclaimed and discussed, and has had a notable influence on later schools, including the Surrealists.

Kālidāsa (*c.* A.D. 400), the most illustrious figure in classic Sanskrit literature and one of the greatest Oriental poets. No facts are known about his life and date, but certain evidence places him in the 5th cent. Seven of his works survive: two lyrics, *Ritu-samhara* (The Seasons), and *Megha-dūta* (Cloud Messenger); two epics, *Raghu-vamśa* (Dynasty of Raghu) and *Kumara-sambhava* (Birth of the War-God); and three dramas, *Śakūntalā*, *Mālavikāgnimitra*, and *Vikramorvaśīya*.

Kant, Immanuel (1724–1804), German scientist and philosopher, whose *Critique of Pure Reason*, published in 1781, was the subject of fierce discussion, and involved him in trouble with the Prussian Government as to his religious belief. His speculations and the transcendental theories he worked out revealed a marvellous capacity of mind, and his works were of immense influence in shaping the philosophical thought of the 18th and 19th centuries.

Kauffmann, Angelica, R.A. (1741–1807), the famous Anglo-Swiss painter, who was one of the foundation members of the Royal Academy, and the first woman R.A.

Kaulbach, Wilhelm von (1805–1874), an eminent German painter who illustrated books by Goethe and Schiller.

Kean, Charles John (1811–1868), an English actor-manager, son of the tragedian, Edmund Kean. Charles Kean married Ellen Tree, and in the 'fifties played with her in a remarkable series of spectacular revivals at the Princess's Theatre in London.

Kean, Edmund (1787–1833), one of the greatest tragic actors in the history of the British stage.

Keats, John (1795–1821), the great English poet who, though dying at the early age of twenty-five, produced a number of poems which in richness of imagination and beauty of thought are not excelled by anything in the language. His *Odes*, his two poems, *Isabella* and *The Eve of St. Agnes*, are exquisite in form and expression.

Keble, John (1792–1866), an English clergyman and poet, whose *Christian Year* is one of the most notable works of its class.

Keene, Charles (1823–1891), one of the most talented of the *Punch* artists.

Keith, Sir Arthur, F.R.S. (1866–1953), an eminent anthropologist. Pres. of British Association, 1927. Author of *The Antiquity of Man*, *Religion of a Darwinist*, *A New Theory of Evolution*.

Kellogg, Frank Billings, LL.D. (1856–1937), was a Judge of the Permanent Court of International Justice, The Hague, 1930–35. American Ambassador to the Court of St. James, 1923–25. Secretary of State, U.S.A., 1925–29; chiefly remembered as the originator of the Kellogg Pact. Awarded Nobel Peace prize, 1929.

Kelly, Sir Gerald Festus, P.R.A. (b. 1879), a successful English portrait-painter whose State portraits of King George VI. and Queen Elizabeth were exhibited at the R.A. in 1945. President of the Royal Academy, 1949–54.

Kelvin, William Thomson, Lord, P.C., O.M., G.C.V.O., F.R.S. (1824–1907), the famous scientist and inventor, introduced the dynamical theory of heat. Shortly afterwards he interested himself in submarine telegraphy, and invented numerous important improvements, also doing splendid work in the direction of electrical invention; he covered a vast field and earned a world-wide reputation.

Kemble, Frances Anne ("**Fanny**") (1809–1893), was a noted actress in the early part of the 19th century. She was the daughter of Charles Kemble (1775–1854), who was also a celebrated actor, associated in many appearances with his brother, John Philip Kemble and their talented, sister, Mrs. Siddons (*q.v.*).

Kemble, John Phulip (1757–1823) was a famous tragedian, and for many years manager of Drury Lane Theatre in London. He was brother to Mrs. Siddons (*q.v.*), who first played with—and overshadowed—him in 1783.

Kempenfelt, Admiral Richard (1718–1782), an English naval officer who saw distinguished service, and sank with his ship the *Royal George* off Spithead, through a shifting of the guns when refitting which caused the vessel to capsize. Some six hundred of the ship's company perished with their admiral.

Kempis, Thomas à (1380–1471), name by which the German mystic and writer Thomas Hammerken was known, was a monk of the St. Augustine order, whose life was mainly spent at a monastery near Zwolle. He was the author of *The Imitation of Christ*, a work which has been translated into all languages, and forms a devotional course which is highly valued.

Kent, William (1684–1748), a leading figure in British art, 1725 until middle of eighteenth century—architecture, landscape gardening, interior decoration, furniture, and painting. Strong Italianate influence. Surviving works: The Great Hall at Holkham, Norfolk, and lay-out at Rousham, Oxfordshire.

Kepler, Johann (1571–1630), renowned German astronomer, assistant to Tycho Brahe (1546–1601), whose measurements he used in working out his laws of planetary motion, which are 1. The planets describe elliptic orbits, of which the sun is one focus. 2. The line joining a planet to the sun sweeps out equal areas in equal times. 3. The square of the period of revolution of a planet is proportional to the cube of its average distance from the sun. The explanation of these laws was given by Newton.

Kesselring, Albert (b. 1885), German general. Commanded the Luftwaffe during the invasion of Poland in 1939 and of the Low Countries in 1940. C.-in-C. in Italy from 1943 until he took over from Rundstedt on the Western Front in March 1945.

Keyes, Admiral of the Fleet, Lord, G.C.B., K.C.V.O., C.M.G., D.S.O. (1872–1945). Commodore of the submarine service during war of 1914–18, and commanded operations against Zebrugge in 1918. Deputy Chief of Naval Staff, 1921–25; Com.-in-Chief Mediterranean Station, 1925–28. Director of Combined Operations, 1940–41.

Keynes, John Maynard, 1st Baron, C.B., M.A., F.B.A. (1883–1946), British economist of international reputation. Bursar and Fellow of King's College, Cambridge. Editor of *Economic Journal*, 1911–46. Principal British Treasury representative at the Versailles peace conference; resigned in protest against plans for reparations, and published his views in *The Economic Consequences of the Peace* (1919). From 1919 onwards engaged in controversial writing on monetary theory. Against the return to the gold standard in 1925. *Treatise on Money* (1930) and *The General Theory of Employment, Interest and Money* (1936) profoundly influenced economic thought and government policy all over the world. Led the British delegation to Bretton Woods and negotiated the American loan agreement of 1945. Married Lydia Lopokova, formerly of the Russian Imperial Ballet, in 1925.

Khrushchev, Nikita Sergeyevich (b. 1894), First Secretary of the Soviet Communist Party since 1953; since 1958, when he succeeded Marshal Bulganin, Chairman of the Council of Ministers (Prime Minister). He visited U.S.A. in 1959.

Kidd, Captain William (*c.* 1645–1701), was a famous pirate who, taking advantage of an appointment to the captaincy of a British ship, engaged in numerous piratical expeditions under cover of the English flag. He was hanged at Execution Dock in London after a sensational trial at the Old Bailey.

Kierkegaard, Sören (1813–55), Danish philosopher and religious thinker whose views have had great influence on contemporary existentialism. His main work is *Either—Or*.

King, Rt. Hon. (William Lyon) Mackenzie, O.M., C.M.G. (1874–1950), Prime Minister of Canada, 1921–25, 1926–30 and 1935–48.

Kingsley Charles (1819–1875), English clergyman and novelist, best known for his historical novels *Hypatia*, *Westward Ho!*, *Hereward the Wake* and children's book *The Water Babies*.

Kipling, Rudyard (1865–1936), poet, novelist, and miscellaneous writer. Made himself celebrated while yet a youth by some exceedingly clever and characteristic sketches of Indian life written for the most part while performing journalistic duties in India. He subsequently settled in London and produced a remarkable succession

of stories, sketches, ballads, and poems, all marked by intense vigour. In 1907 was awarded the Nobel Prize.

Kirchhoff, Gustav Robert (1824–87). German physicist. He did important work in electricity and thermodynamics and put spectrum analysis on a firm basis. Published, among other scientific works, *Researches on the Solar Spectrum*.

Kitchener, of Khartoum, Field Marshal Earl, K.G., K.P., G.C.B., O.M. (1850–1916), British soldier. By his victory at Omdurman in 1898 he crushed the Sudanese dervishes and avenged General Gordon. In the early stages of the South African War he assisted Lord Roberts and took over command himself in 1900. C.-in-C. India, 1902–9; Secretary of War, 1914–16. Drowned June 5, 1916, by the torpedoing of the *Hampshire* while on his way to Russia.

Klee, Paul (1879–1940), Swiss artist, studied at Munich, Paris and Rome and later became Professor at Düsseldorf Academy. He lived in a restless, experimental period. His paintings are small-scale, delicate dream-world fantasies, full of poetical content.

Kneller, Sir Godfrey, Bt. (1646–1723), the most celebrated portrait painter of his day in England, who enjoyed the patronage in succession of Charles II., James II., William III., Anne, and George I. He painted the portraits of the members of the Kit-Cat Club, and was buried in Westminster Abbey.

Knight, Dame Laura, D.B.E., R.A., R.W.S., R.E., a prominent British painter. Pres. of Socy. of Women Artists, 1931. Her husband, Harold Knight, R.A. (b. 1874), is a distinguished portrait-painter.

Knox, John (1505–1572), the famous divine and Reformer, who stirred Scotland to mighty religious impulses in the reign of Mary Queen of Scots.

Knox, Edmund George Valpy ("Evoe") (*b.* 1881), editor of *Punch*, 1932–48.

Knox, Rt. Rev. Mgr. Ronald Arbuthnot (1888–1957), Catholic Chaplain at the University of Oxford, 1926–39, and a well-known author. His works include detective stories, among which are *The Viaduct Murder* and *Footsteps at the Lock*.

Knutsford, 2nd Viscount (1855–1931), was Chairman of the London Hospital for over 30 years.

Koch, Robert (1843–1910), the most noted bacteriologist of the time, whose discoveries in connection with the bacillus of tuberculosis have greatly benefited mankind. He also closely studied the causes of Asiatic cholera and bubonic plague.

Kodály, Zoltán (b. 1882), Hungarian composer and teacher. He worked with Bartok in the collection of folk-tunes and his compositions include chamber music, sonatas, songs, the great choral work *Psalmus Hungaricus* and the orchestral suite *Háry János*.

Koniev, Marshal of Soviet Union, Ivan Stapanovitch (b. 1898), one of Russia's outstanding military leaders in the second world war. C.-in-C. Soviet Army, 1946.

Kosciuzko, Tadeusz Andrzoj Bonawentura (1746–1817), a Polish general and patriot who achieved great distinction in 1794 by his gallant leading of the Polish revolutionary forces against Russia. From 1776 to 1783 took part in the American War of Independence.

Kossuth, Louis (1802–1894), a Hungarian patriot and leader, who in the struggle for his country's freedom in 1849 was for a time successful, but ultimately had to acknowledge defeat, and fled first to Turkey and afterwards to England, where he lived for some years.

Kotelewela, Col. the Rt. Hon. Sir John Lionel, C.H., K.B.E. (b. 1897), Prime Minister of Ceylon, 1953–56.

Kreisler, Fritz (b. 1875), Austrian violinist, studied in Paris under Massart. First played in the United States in 1888. He has composed numerous violin pieces, a quartet, and some operettas. Became an American citizen in 1943.

Křenek, Ernst (b. 1900), Austrian composer of partly Czech descent. He first composed in a neo-classic or anti-romantic style, later the influence of jazz was prominent in his compositions, which include the jazz opera *Jonny spielt auf* and many instrumental works and songs. In 1938 he emigrated to the United States.

Kropotkin, Peter Alexeivich, Prince (1842–1921), anarchist, geographer and explorer, who, after a distinguished career in Russia, his native country, was imprisoned for favouring the political action of a working men's association, but escaped to England. He wrote many important books on socialistic and geographical subjects. Returned to Russia in 1917.

Krüger, Stephanus Johannes Paulus (1825–1904), the Boer leader, was one of the outstanding figures of South Africa in the last half of the nineteenth century. As a small boy he accompanied his family on the Great Trek. He was active in Transvaal politics for many years, and served as President from 1883 to 1900. His attitude towards the Uitlanders (English and other non-Boer white inhabitants of the Transvaal) produced much of the tension which led to the South African War. During the war he made unsuccessful attempts to secure help for the Boers from various European powers.

Krupp, Alfred (1812–1887), the famous German engineer, founded the great gun factories at Essen, which were the largest in the world. By his introduction of the Bessemer plan of casting steel and the steam hammer into Germany, he brought about an important development in heavy breech-loading guns, and built up factories which employed at the time of his death 20,000 workmen.

Kubelik, Jan (1880–1940), Czech violinist—son of a gardener at Michle, near Prague—who at the age of twelve played in public, and was one of the most renowned instrumentalists of his day. His son **Rafael** (b. 1914), a conductor of international repute, became musical director of the Royal Opera House, Covent Garden, in 1955.

Kublai Khan (1216–1294), a famous Mogul emperor and grandson of Jenghiz Khan. He greatly extended the Mogul empire by conquest, and lived in unparalleled splendour.

L

Lablache, Luigi (1794–1858), a famous bass singer and actor, especially popular in London. He held the position of singing tutor to Queen Victoria.

La Fayette, Marie Joseph Paul Roch Yves Gilbert du Motier, Marquis de (1757–1834), French soldier and humanitarian politician who fought on the side of the Colonists in the American War of Independence and on returning to France became C.-in-C. of the National Guard of Paris. By signing the demand that the king summon the States-General he became the first leader of the French Revolution, but stood out against its later excesses. In 1830 he was instrumental in setting Louis Philippe on the French throne.

La Fontaine, Jean de (1621–1695), the celebrated French poet and fabulist. His fables have been translated into all languages, and are unique.

Lagerlöf, Selma, Ph.D. (1858–1940), the famous Swedish novelist who was awarded in 1909 the Nobel Prize for literature. In 1914 was elected the first woman member of the Swedish Academy.

Lagrange, Joseph Louis, Comte (1736–1813), noted French astronomer and mathematician.

Lalande, Joseph Jerome Lefrançais de (1732–1807), a famous French astronomer and director of the Paris Observatory. He founded the Lalande yearly prize for the best astronomical work or observation and wrote a well-known treatise on astronomy.

Lamarck, Jean Baptiste Pierre Antoine de Monnet, Chevalier de (1744–1829), the prominent French zoologist who occupied important scientific posts in Paris. A precursor of Darwin, his name rests mainly on his theory of the evolution of animals, known as Lamarckism. His chief work was the *Histoire Naturelle des Animaux sans Vertèbres*.

Lamb, Charles (1775–1834), one of the most delightful of our essayists. His *Essays of Elia* are characterised by great felicity of expression much genial humour and an ardent love both of rural life and London life. He was a clerk in the office of the East India Company for thirty-five years. In some of his writings he was assisted by his sister, Mary Lamb, to whom he was greatly devoted.

Lamb, Sir Horace, F.R.S. (1849–1934), a British scientist, was the leading authority on hydro-

dynamics, and did valuable research work on wave motions and electricity.

Lambert, Constant (1905–51), English composer, conductor and critic; musical director of the Sadler's Wells Ballet. His *Rio Grande* for chorus, piano, and orchestra, shows some jazz influence.

Landor, Walter Savage (1775–1864), a writer and poet of strong genius. He wrote a fine poetic tragedy *Count Julian* in 1812, and in later life published several other volumes of poems. The work by which he is best known, however, is his *Imaginary Conversations*.

Landseer, Sir Edwin Henry, R.A. (1802–1873), the most celebrated English animal painter of his time. He designed the lions for the base of the Nelson Monument in Trafalgar Square.

Lane, Edward William (1801–1876), an English writer to whom we owe the most popular translation of the *Arabian Nights*. He was also the author of a number of books dealing with ancient Egyptian and Arabic subjects, and was one of the most prominent Orientalists of the 19th century.

Lanfranc (c. 1005–89), Italian churchman, b. at Pavia; Archbishop of Canterbury, 1070. Closely associated with Duke William of Normandy (William I. of England); carried out Church reforms and preserved its independence.

Lang, Andrew (1844–1912), Scottish scholar and writer of great versatility, his numerous works including poetry, fiction, history, fairy tales, folk-lore, and translations from the classics.

Lang of Lambeth, Most Rev. Cosmo Gordon Lang, 1st Baron, P.C., G.C.V.O., D.D. (1864–1945), Archbishop of Canterbury, 1928–42; and of York, 1908–28; Bishop of Stepney, 1901–08.

Langland, William (c. 1330–1400), author of the alliterative poem *The Vision of Piers the Plowman*.

Langton, Stephen (1151–1228), was Archbishop of Canterbury from 1213, and one of the chief instruments in forcing the Magna Carta from John.

Lansbury, Rt. Hon. George (1859–1940). British Labour politician; Chairman of Parliamentary Labour Party, 1931–35, Leader of the Labour Party, 1932–35. M.P. Bow and Bromley, 1910–12, and 1922–40.

Lao-Tzŭ, one of the ancient philosophers of China, who flourished about 600 B.C. The classic upon which his fame rests, *Tao-tê-ching*, was written many years later.

Laplace, Pierre Simon, Marquis de (1749–1827), French mathematician and astronomer whose researches on the motions of the solar system and the theory of probability earned him the title of "the Newton of France."

La Rochefoucauld, François, Duc de (1613–1680), a renowned French statesman and writer of the Louis XIV. period. His *Reflections and Moral Maxims* is a classic.

Lasker, Emanuel, Ph.D. (1868–1941), world's chess champion, 1894–1921—defeated by Capablanca (*q.v.*).

Lassalle, Ferdinand (1825–64), founder of the German Socialist movement, and as such exerted deep influence throughout Europe. His life story forms the basis of George Meredith's novel *The Tragic Comedians*.

Lasso, Orlando di (c. 1532–94), Flemish composer and choirmaster, contemporary of Palestrina, and the writer of over 2,000 compositions, including *chansons*, madrigals, and sacred music.

Laszio de Lombos, Philip Alexius, M.V.O. (1869–1937), the most fashionable portrait painter of modern times. President of Royal Society of British Artists, 1930.

Latimer, Hugh (*circa* 1485–1555), the English Reformer who became Bishop of Worcester under Henry VIII., but when Mary came to the throne was condemned as a heretic and burned at the stake.

Laud, William (1573–1645), an eminent ecclesiastic, who, after filling three minor bishoprics, was made Archbishop of Canterbury in 1633. He did much to direct the policy of Charles I., and when trouble followed, he was impeached by the Long Parliament and committed to the Tower. Was tried for treason and beheaded.

Lauder, Sir Harry (MacLennan) (1870–1950), famous singer of Scottish songs and ballads. Composed own songs and wrote own music. Knighted 1919 for services in raising money for war purposes.

Laval, Pierre (1883–1945), French politician, won notoriety over the Hoare–Laval pact in 1935. During the German occupation he was the arch French collaborator, and was afterwards tried for treason and shot.

Lavery, Sir John, R.A. (1856–1941), an eminent portrait painter; Pres. of the Royal Society of Portrait Painters, 1932–41.

Lavoisier, Antoine Laurent (1743–1794), often called the "father of chemistry," was born in Paris, and was the first to establish the fact that combustion is a form of chemical action.

Law, Rt. Hon. Andrew Bonar (1858–1923), Conservative statesman. He became leader of the Opposition in 1911, joined the Coalition in 1915, and served as Prime Minister from 1922 until shortly before his death in 1923.

Lawrence, David Herbert (1885–1930), one of the most powerful and original of modern novelists, and as a poet ranked among the best this century has produced. Author of *The White Peacock*, *Sons and Lovers*, *The Plumed Serpent*, etc.

Lawrence, Sir Thomas, P.R.A. (1769–1830), one of the fashionable portrait painters of his day.

Lawrence, Col. Thomas Edward (1888–1935), known as "Lawrence of Arabia," British soldier, archaeologist and explorer. Organised and led the Arabs against the Turks in the war of 1914–18. Author of *The Seven Pillars of Wisdom* (1926), of which an abbreviated edition, *Revolt in the Desert*, was published in 1927.

Leacock, Stephen Butler (1869–1944), Head of Dept. of Economics, McGill University, Montreal, 1908–36; but best known throughout the world as a humorous writer.

Lecky, Rt. Hon. William Edward Hartpole, O.M. (1838–1903), an eminent historian. His best-known works are *The History of England in the Eighteenth Century* and *The History of European Morals*.

Leclerc (de Hauteclocque), General Jacques Philippe, Marshal of France (1902–1947), French soldier of considerable personal popularity. Was Governor of the Cameroons in 1940, declared for the Free French and later led a Free French force from Lake Chad across the Sahara desert to join the Allied Forces in North Africa. Liberated Paris in 1944; commanded French troops in Indo-China, 1946. Killed in air crash in Algeria.

Le Corbusier, pseudonym of Charles-Edouard Jeanneret-Gris (b. 1887), Swiss-born French architect and town-planner whose works and theories with their emphasis on organic planning have profoundly influenced contemporary architecture. Famous for his *ville radieuse* conception of a city and architect of *L'Unité d'Habitation* at Marseilles and of Chandigarh, the new capital of East Punjab.

Lee of Fareham, Viscount, P.C., G.C.B., G.C.S.I., G.B.E. (1868–1947), First Lord of the Admiralty, 1921–22. Minister of Agriculture, 1919–21. Presented Chequers Court to the nation as a residence for British Premiers, 1917.

Lee, Robert Edward (1807–70), was one of the ablest Confederate generals in the American Civil War, and C.-in-C. when the final surrender was made at Appomattox in 1865.

Lee, Sir Sidney (1859–1926), the great authority on Shakespeare, and joint editor with Sir Leslie Stephen of the *Dictionary of National Biography*, exercising undivided control over the completion of that monumental work during the last ten years of its publication.

Leech, John (1817–1864), perhaps the most popular of all the *Punch* artists, whose sketches and cartoons were the life and soul of the paper for many years.

Lehar, Franz (1870–1948), Hungarian composer, chiefly of light operas, which include *The Merry Widow*, *The Count of Luxembourg*, *Frederica*, *The Land of Smiles*.

Leibnitz, Gottfried Wilhelm, Freiherr von (1646–1716), German writer and philosopher and one of the world's supreme intellects. Invented the infinitesimal calculus which he published in 1684, independently of Newton whose previous work on the same subject was published in 1687.

Leicester, Robert Dudley, Earl of (1531–88), son of John, Duke of Northumberland (*q.v.*), was a favourite of Queen Elizabeth. He commanded

the English troops in the Netherlands, 1585–87, and in England before the Armada. Married to Amy Robsart (*q.v.*).

Leighton, Frederick, Baron, P.R.A. (1830–96), English painter whose popular pictures dealt with classical subjects, characterised by delicacy of finish and splendour of colour. Among his more famous paintings are *Venus Disrobing, Clytemnestra*, and *The Garden of the Hesperides*. He was also a sculptor.

Lely, Sir Peter (1618–80), the famous painter to whom we owe so many of the portraits of the beauties of the Court of Charles II. He was born at Soest and his proper name was Van der Faes.

Lenin, Vladimir Ilyich Ulyanov (1870–1924), an active worker for the Russian Revolution from 1893–1917 both "underground" in Russia and abroad. It was in this period that the revolutionary Social-Democratic party was formed. An uncompromising revolutionary group, known as the Bolsheviks, developed within this party and Lenin was its leading spirit. In April 1917 Lenin returned to Russia. In the 1917 November Revolution the Provisional Government was overthrown by the Bolsheviks and Lenin became President of the New Government, the Council of People's Commissars—the Sovnarkom. From 1917 to his death in 1924 Lenin remained the active head of the Russian Soviet Government.

Leonardo da Vinci (1452–1519), Italian painter, sculptor, architect, scientist, engineer, and musician. His creative power as an artist and scientist mark him as a supreme example of Renaissance genius. He went to Milan *c.* 1482 and worked for 16 years in the service of the powerful prince Ludovico Sforza. He was for a time with Cesare Borgia on his campaigns and died in exile as a pensioner of Francis I of France. Among his works are the famous *Last Supper, Mona Lisa, Madonna of the Rocks*, and *St. John the Baptist*.

Leoncavallo, Ruggiero (1858–1919), Italian composer of opera whose *Pagliacci* was his one outstanding success.

Leonidas was king of Sparta at the time of the invasion of Greece by Xerxes, 480 B.C., and led the defence of the Pass of Thermopylæ, where he fell.

Lermontov, Mikhail Yurevich (1814–41), great Russian poet and novelist, exiled to the Caucasus for the passionate, revolutionary poem addressed to Czar Nicholas I. written on the death of Pushkin. He has often been called the poet of the Caucasus, for the stern, mountainous country of his youth and exile had a great influence on his poetry. His novel *A Hero of Our Time* was written while he was at St. Petersburg in 1839. Lost his life in a duel.

Le Sage, Alain René (1668–1747), author of the famous stories *Gil Blas* and *Le Diable Boiteux*, also a dramatist of note.

Leslie, Charles Robert, R.A. (1794–1859), an eminent British painter; produced many notable pictures, including *The Play-Scene from Hamlet, Sancho Panza and the Duchess*, etc.

Lesseps, Vicomte Ferdinand de (1805–94), an engineer of large ideas who, while Vice-Consul at Alexandria, conceived the plan of the Suez Canal, which work was completed in 1869. He afterwards projected the original Panama Canal, which failed.

Lessing, Gotthold Ephraim (1729–81), a noted German critic and dramatic poet, whose most celebrated work was his *Laokoon*.

Leverhulme of the Western Isles, 1st Viscount (1851–1925). Chairman and founder of the soapmaking firm of Lever Brothers, Port Sunlight, which later, by purchase and amalgamation, increased in size and importance to become Unilever Ltd. He was for many years prominent as a business pioneer and man of affairs and one of the most practical exponents of the industrial partnership movement. Presented Lancaster House to the nation, the home of the London Museum.

Leverrier, Urbain Jean Joseph (1811–77), the French astronomer, co-discoverer with John Couch Adams of the planet Neptune.

Lewis, Cecil Day, C.B.E., M.A. (b. 1904), poet and critic. Prof. of Poetry, Oxford Univ., 1951–6. Besides various poetical works has published translations of *The Georgics* and *The Aeneid* of Virgil; also detective novels under pseudonym of Nicholas Blake.

Lewis, Clive Staples, M.A., F.R.S.L. (b. 1898), author of various books of popular theology, such as *The Screwtape Letters* and *The Great Divorce*, and of the medieval study *Allegory of Love*.

Lewis, Sinclair (1885–1951), an American author who secured his first great success in 1920 with his novel of provincial American life, *Main Street*. *Babbitt*, published two years later, ruthlessly satirised the 100 per cent. disciple of American *Big Business*, and added a new term, "Babbitry," to the American language. Awarded the Nobel Prize for literature, 1931.

Lidgett, Rev. Dr. John Scott, C.H., M.A., D.D. (1854–1953), founder of the Bermondsey Settlement (1891); joint editor of the *Contemporary Review*; leader of Progressive Party on L.C.C., 1918–28; a former President of the National Free Church Council.

Lie, Trygve (b. 1896), Sec.-Gen. of the United Nations 1946–52. Formerly a leading Norwegian politician and Foreign Minister, 1941–46.

Liebermann, Max (1847–1935), German impressionist painter. Among his finest pictures are *The Flax Spinner, The Woman with Goats*, and *The Net-Menders*.

Li Hung Chang (1823–1901), an enlightened Chinese statesman and general, who by sheer ability rose from a humble position to be Chief Minister, and exercised almost supreme control for a number of years.

Lilburne, John (1614–57), an English political agitator and pamphleteer, who became the leader of the Levellers, the democratic party in the English Revolution.

Linacre, Thomas (*c.* 1460–1524), humanist scholar and physician, founder of the College of Physicians. Published translations of Galen's works.

Lincoln, Abraham (1809–65), was a native of Kentucky; in early life he became a lawyer, and was returned to Congress in 1846 from Springfield, Illinois, and in 1861 was elected 16th President of the United States, when he delivered his famous anti-slavery pronouncement, which led to the Civil War of 1861–65. In 1864 he was re-elected, and in the following year was assassinated by John Wilkes Booth.

Lind, Jenny (1820–87), a famous prima donna, "the Swedish nightingale" as she was called, who made a great sensation by her wonderful voice for some seasons in Europe, London and in America, from 1837 onward.

Linnæus, Carl von Linné (1707–78), a tireless Swedish doctor and scientist who became one of the most distinguished of naturalists, and the founder of modern botany. His *Systema Naturæ* was published in 1735, and other monumental works followed. First to expound the true principles for defining genera and species.

Lippi, Fra Filippo (1406–69), one of the great artists of the Italian quatrocento, whose frescoes can be seen in Prato Cathedral. His son **Filippino** (1457–1504) was equally gifted and executed many great works, including frescoes in the Carmine, Florence, and the altar-piece *Virgin and Saints* in the Uffizi Gallery.

Lippmann, Gabriel (1845–1921) French physicist, whose more important work was in the field of colour photography. His numerous inventions include the capillary-electrometer, which bears his name, and many other delicate instruments. Awarded the Nobel Prize for Physics, 1908.

Lippmann, Walter (b. 1889), American journalist, whose column in the New York *Herald Tribune* has a wide influence.

Lipton, Sir Thomas Johnstone, Bt., K.C.V.O. (1850–1931), after an adventurous early career in America, started shopkeeping in his native Glasgow, and in course of a few years became the largest shopkeeper in the world. Was renowned for his charities, and his attempts to win the America's Yachting Cup.

Lister, Lord, P.C., O.M., F.R.S. (1827–1912), achieved renown for his discovery of the antiseptic treatment which has accomplished so much on behalf of surgery. Pres. of Royal Socy. 1895–1900; and of British Assn. 1896.

Liszt, Franz (1811–86). Hungarian pianist and composer, whose brilliant playing astonished

and delighted Europe and rather overshadowed his importance as a composer. He originated the symphonic poem. His daughter Cosima married Wagner.

Litvinov, Maxim Maximovich (1876–1952), Russian diplomat and statesman; Soviet Diplomatic Agent to Great Britain, 1917, Commissar for Foreign Affairs, 1929–39; Soviet Ambassador to United States, 1941–43.

Livingstone, Dr. David (1813–73), the great Scottish explorer and missionary, whose discoveries in Africa included the course of the Zambesi, the Victoria Falls, and Lake Nyasa. He opened up Central Africa to the influences of Christianity, and stirred the public conscience to the horrors of the Slave Trade. In 1871 considerable apprehension was felt in regard to his fate, but he was discovered by H. M. Stanley at Ujiji near Lake Tanganyika.

Lloyd, Rt. Hon. John Selwyn Brooke, Q.C., C.B.E., M.P. (b. 1904), For. Sec. 1955– ; Min. of Defence, 1955; Min. of State at Foreign Office, 1951–55.

Lloyd, Marie (1870–1922), English music-hall artist and genius of Cockney comedy.

Lloyd George of Dwyfor, Earl, O.M. (1863–1945). Chairman of the Liberal Party, 1924–31. Prime Minister, 1916–22. M.P. for Caernarvon 1890–1944. As a War Premier he displayed activity, resourcefulness, and driving power, which proved a tremendous influence in bringing about the defeat of Germany; and at the Peace Conference, in conjunction with Clemenceau and President Wilson, he was a master spirit. His daughter **Lady Megan Lloyd George** who was Liberal M.P. for Anglesey from 1929 to 1951 joined the Labour Party in 1955.

Locke, John (1632–1704), one of the great English liberal philosophers and founder of empiricism, the doctrine that all knowledge is derived from experience. His chief work in theoretical philosophy, *Essay Concerning Human Understanding*, was written just before the revolution of 1688 and published in 1690. Other writings include: *Letters on Toleration*, *Treatises on Government*, and *Education*.

Lombroso, Cesare, M.D. (1836–1909), famous Italian criminologist; in 1889 published his monumental work *L'uomo delinquente*, in which he put forward the theory that there was a definite criminal type which could be distinguished from the normal type, both anatomically and psychologically. He did much by his writings to hasten prison reform.

Lomonosov, Mikhail Vasilyevich (1711–65), Russian poet, philosopher, and scientist, closely associated with the foundation of Moscow University in the reign of the Empress Elizabeth.

London, John Griffith ("Jack") (1876–1916), an American novelist who led an adventurous life and wrote many popular novels and stirring books of adventure.

Longfellow, Henry Wadsworth (1807–82), an American poet who produced a number of volumes of poetry of great purity of thought and beauty of language. Author of *Hiawatha*.

Lonsdale, Dame Kathleen, D.B.E., F.R.S. (b. 1903), Professor of Chemistry and head of the Dept. of Crystallography, Univ. College, Univ. of London. Her publications include *X-Rays and Crystals*, *International Tables for X-Ray Crystallography*, and *Removing the Causes of War*.

Lonsdale, 5th Earl of, K.G., G.C.V.O. (1857–1944), was a well-known sportsman whose special interests were horse-racing, hunting and boxing, the Lonsdale belts having been founded by him.

Lope de Vega Carpio, Félix (1562–1635), founder of the Spanish drama, and one of the great figures of Spanish literature. He was one of the most prolific of writers, his dramatic productions alone numbering 1500 plays, of which some 450 survive.

Louis IX. (1214–70), St. Louis, king of France, crusader, and peace-maker, fulfilled the medieval ideal of the knightly king. Memoirs by the Sire de Joinville.

Louis XIV. (1638–1715), reigned over France from 1643 to his death. He was responsible for corrupting Charles II., for the persecution of the Huguenots, the repeal of the edict of Nantes, and for the war of the Spanish succession. He was a sensual, luxury-loving king, but encouraged arts and literature.

Louis XV. (1710–74), called the Well-Beloved. He was licentious and indolent, and an inveterate hater of England.

Louis XVI. (1754–93), was the apathetic and unfortunate French king who married Marie Antoinette, allowed his country to be swayed by first one statesman and then another, until at last he saw himself divested of every shred of power by the Revolutionists. How he and his Queen were subsequently imprisoned and sent to the guillotine all students of French history know.

Louis, Joe (b. 1914), world's heavyweight boxing champion. Established a record by successfully defending his title twenty-four times in the years 1937–48. Retired from the ring in 1949.

Low, Archibald Montgomery, D.Sc. (1888–1956), a distinguished British scientist who had many inventions to his credit connected with wireless, television, coal and petrol engines, anti-aircraft and anti-tank rocket apparatus.

Low, David Alexander Cecil (b. 1891), the well-known cartoonist, creator of Colonel Blimp. Joined the *Manchester Guardian* in 1953, having previously been on the staffs of the *Daily Herald* and *Evening Standard*.

Lowell, James Russell (1819–91), an American writer and poet of singular power and humour.

Loyola, St. Ignatius (1491–1556), was the founder of the order of Jesuits.

Lucretius (Titus Lucretius Carus) (99–55 B.C.), great Roman poet of antiquity, whose life-work was the poem *On Nature* (*De rerum natura*) in six books, the first two of which set out the atomic theory of matter as understood by Epicurus.

Ludendorf, General Erich von (1865–1937), was Chief of Staff, and shared with Hindenburg the military leadership of Germany during the Great War. Largely responsible for the victory of Tannenberg and the overwhelming successes of 1915.

Ludwig, Dr. Emil (1881–1948), author of many historical works, including biographies of Goethe, Beethoven, Bismarck, Napoleon, and Lincoln.

Lugard, Frederick, Lord (1858–1945), British colonial administrator, a man of abounding energy, initiative, tact and firmness, and possessing considerable military abilities. Helped to build up the British dominions in tropical Africa (Nyasaland, Uganda, Nigeria) and to establish the principles of British African administration, notably the system of "indirect rule" through native rulers. In 1922 published the *Dual Mandate in Tropical Africa*, which set out the thesis that Europe is in Africa for the reciprocal benefit of her own industrial classes and the native races.

Luther, Martin (1483–1546), the great German Reformer. Was ordained a priest in 1507. Became Professor of Theology at the University of Wittenberg and until 1517 was an orthodox Roman Catholic. His first idea of revolt occurred when he saw indulgences being sold, a practice which he openly condemned. For this he was excommunicated, and summoned before the Diet at Worms, where he made a memorable defence. He then separated himself from the Roman Catholics, and began to preach the Reformed Religion, his doctrine being formulated in the confession of Augsburg. He lived to see the principles of the Reformation widely established.

Lutyens, Sir Edwin Landseer, O.M., K.C.I.E., R.A. (1869–1944), was a famous architect; designer of the Cenotaph; New Delhi; new British Embassy, Washington; Roman Catholic Cathedral Liverpool, etc. One of the principal architects for the Imperial War Graves Commission. Pres. of the Royal Academy, 1938–43.

Lycurgus, the Spartan legislator, who flourished about 844 B.C., and drew up a series of laws which endured for 700 years.

Lyell, Sir Charles, Bt., F.R.S. (1797–1875), distinguished geologist, author of *Principles of Geology*, and supporter of the Darwinian theory.

Lysenko, Trofim (b. 1898), Russian biologist whose concept of genetics, that environmental experiences can change heredity, though discredited in scientific circles outside the U.S.S.R.,

was accepted there as an official dogma until 1953.

Lytton, Edward George Earle Bulwer, 1st Baron, P.C., G.C.M.G. (1803–73), a prolific novelist and dramatist, whose romantic stories made him famous, and included *Pelham, The Last Days of Pompeii*, and *The Caxtons*.

Lytton, Sir Henry Alfred (1867–1936), was a noted British actor who scored many successes, chiefly playing Gilbert and Sullivan roles.

M

Macadam, John Loudon (1756–1836), Scottish engineer who invented the process of road-repairing which bears his name.

MacArthur, General Douglas, Hon. G.C.B., D.S.C., D.C.M. (b. 1880), American soldier famous for his gallant defence of the Philippines against the Japanese in 1941–42. Relieved of his commands in the Far East during the Korean campaign by President Truman in April 1951.

Macaulay, Rose, D.B.E. (1881–1958), an English authoress and literary critic. Among her literary successes are *Potterism, Dangerous Ages, Told by an Idiot, Orphan Island* and other novels noted for their keen satirical wit and devastating exposure of the follies of her time.

Macaulay, Thomas Babington, Lord (1800–59), the most brilliant historian of the Victorian era. His fame was assured by his *Essays* and *Lays of Ancient Rome*, and his *History* did more than confirm it. He was a son of **Zachary Macaulay** (1768–1838), the anti-slavery agitator, and sat in Parliament as member for Calne for some years, also serving for five years as a member of the Supreme Council of Calcutta. On his home-coming, he again entered Parliament as member for Edinburgh, and gained a new celebrity by his speeches. He at different times filled the offices of Paymaster-General and Secretary for War. Both Lord Macaulay and his father lie buried in Westminster Abbey.

Macbeth, according to Holinshed's *Chronicle*, was the usurping Scottish king who succeeded Duncan, whom he murdered. Macbeth was slain by Duncan's son Malcolm in 1056, after a reign of seventeen years. His history forms the subject of Shakespeare's celebrated tragedy.

MacCarthy, Sir Desmond, F.R.S.L., Hon. D.Litt., Hon. LL.D. (1877–1952), journalist and critic who became dramatic critic to *The Speaker*, 1904, and *The New Statesman*, 1913, where he soon made a reputation both for the substance and style of his writings. He edited *The New Quarterly*, 1907–10 and later *Life and Letters*. Latterly was literary critic to *The Sunday Times*.

MacCarthy, Justin (1830–1912), Irish politician, novelist, and historian, from 1879 to 1896 was a prominent member of the Irish Party in Parliament, succeeding Mr. Parnell in 1890 in the leadership of the party.

McCormack, (Count) John (1884–1945), was the world famous Irish tenor who became a naturalised American citizen in 1919; received a Papal peerage as Count from Pius XI in 1928.

Macdonald, Flora (1722–90), Scottish Jacobite heroine who saved the life of Prince Charles Edward after the defeat at Culloden Moor in 1746.

Macdonald, Sir John Alexander (1815–91), Canadian statesman of great vigour and imagination who became the first Prime Minister of the Dominion of Canada.

MacDonald, Rt. Hon. James Ramsay (1866–1937), Prime Minister in the first two Labour Governments, 1924, 1929–31, and in a Coalition Government dominated by Conservatives, 1931–35. His son, **Malcolm** (b. 1901), has been Dominions Secretary, High Commissioner in Canada, Gov.-Gen. of Malaya, Comm.-Gen. for S.E. Asia, and since 1955 High Comm. in Delhi.

McDougall, William, F.R.S. (1871–1938), British psychologist. Professor of Psychology at Harvard University 1920–27, and Duke University, North Carolina 1927–38. His *Introduction to Social Psychology* (1908) achieved international reputation.

Machiavelli, Niccolo (1469–1527), a Florentine diplomatist and historian, whose book, *Il Principe*, has maintained its celebrity as a masterly exposition of the method of governing by artifice.

Mackail, Prof. John William, O.M. (1859–1945), British classical scholar, Prof. of Poetry at Oxford, 1906–11, and translator of the *Odyssey*. Father of **Denis Mackail** (b. 1892), novelist and short-story writer, and of **Angela Thirkell** (b. 1890), also a novelist.

McKell, Sir William John, G.C.M.G., K.C. (b. 1891), Gov.-Gen. of Australia 1947–52. Previously engaged in Australian politics.

Mackenzie, Sir (Edward Montague) Compton, O.B.E. (b. 1883), one of the foremost of present-day British novelists; literary critic to the *Daily Mail*, 1931–35; Rector of Glasgow Univ., 1931–34.

Macmillan, Rt. Hon. Harold, M.C., M.P. (b. 1894), succeeded Sir Anthony Eden as Prime Minister in Jan. 1957. First entered Parliament in 1924 as M.P. for Stockton-on-Tees. He has represented Bromley, Kent, since 1945 and has served as Minister of Housing and Local Government, Min. of Defence, Foreign Sec., Chancellor of the Exchequer. He is a member of the well-known publishing family. Chanc. Oxford University, 1960.

McMillan, Margaret, C.H., C.B.E. (d. 1931), Scotswoman, born in America, who with her sister Rachel was a pioneer of child welfare work. Founder of open-air nursery schools. The Rachel McMillan nursery school at Deptford is a memorial to her work.

McNaughton, Gen. Hon. Andrew George Latta C.H., D.S.O. (b. 1887), Canadian soldier, politician, electrical engineer, and representative on the U.N. Atomic Energy Commission.

Macready, William Charles (1793–1873), was the outstanding tragic actor of his time and was extremely successful in Shakespearian and other rôles.

Maeterlinck, Count Maurice (1862–1949), Belgian man of letters whose plays include *La Princesse Maleine, Pelléas et Mélisande*, and *L'Oiseau Bleu*. Well known for his work on bees and ants.

Magellan, Ferdinand (c. 1480–1521), a famous Portuguese navigator, and commander of the first expedition (1519) to sail round the world.

Mahler, Gustav (1860–1911), Austrian composer and conductor; a writer of symphonies and songs, a classical romantic, much influenced by Anton Bruckner and Wagner. He completed nine symphonies (some with voices), and examples of his work in song-cycle form are *Das klagende Lied, Kindertotenlieder*, and *Das Lied von der Erde* (for solo voices and orchestra). From 1907 until his death he conducted a series of concerts in America.

Maintenon, Françoise d'Aubigné, Marquise de (1635–1719), after being the wife of the poet Scarron, drifted into Court circles, and so fascinated Louis XIV. that he ultimately married her. At his death she retired to a convent.

Malibran, Marie Félicité (1808–36), was one of the most famous operatic singers of her time.

Malik, Yakov Alexandrovich (b. 1906), Soviet diplomatist who has been Deputy Min. of Foreign Affairs, Permanent Rep. of U.S.S.R. to U.N., 1948–52, and since 1953 Soviet Ambassador to Great Britain.

Malory, Sir Thomas (c. 1430–70), compiled the *Morte d'Arthur*, which was printed by Caxton in 1485, and relates the story of King Arthur and the Knights of the Round Table.

Malraux, André (b. 1895), French novelist whose works include *La Condition humaine* (*Man's Fate*), *L'Espoir* (*Man's Hope*), and *Psychologie de l'art* (translated into 2 vols., *Museum without Walls* and *The Creative Act*).

Malthus, Thomas Robert, F.R.S. (1766–1834), an English clergyman and political economist who in his essay on *The Principle of Population* proposed to limit the increase of population by discouraging marriage and otherwise.

Malvern, 1st Viscount, Godfrey Martin Huggins, C.H., K.C.M.G., F.R.C.S., Prime Min. of S. Rhodesia, 1933–53 and of the Federation of Rhodesia and Nyasaland, 1953–56.

Manet, Edouard (1832–83), French Impressionist painter, whose pictures *Olympia* and *Lola de Valence* have been acclaimed masterpieces.

Mann, Thomas (1875–1955), German writer who won immediate world recognition at the age of 25 with his novel *Buddenbrooks*. His liberal

humanistic outlook had developed sufficiently by 1930 for him unerringly to expose the nature of National Socialism. He left Germany in 1933 to live in Switzerland and then settled in the United States. Awarded the Nobel Prize for Literature in 1929; E. and W. Germany combined to honour him with the Goethe Prize in 1948. His best-known works, apart from many volumes of essays, stories, and shorter novels, are *The Magic Mountain* (1924), the *Joseph* tetralogy (1935–43), *Dr. Faustus* (1947) and *Felix Krull* (1954).

Mann, Tom (1856–1941), was a prominent British Labour leader for more than 50 years.

Manning, Henry Edward, Cardinal (1808–92), Cardinal Archbishop of Westminster 1875–92, was a prominent Anglican Churchman up to 1851, when he joined the Church of Rome.

Mansfield, Katherine (1890–1923), short-story writer, born in Wellington, New Zealand, whose work was strongly influenced by the short stories of Chekov. Her second husband was John Middleton Murry, author and literary critic.

Manson, Sir Patrick, G.C.M.G., M.D., F.R.S. (1844–1922), an eminent physician who specialised in parasitology and became physician and medical adviser to the Colonial Office. He was the first to formulate the hypothesis that the malarial parasite was transmitted by the mosquito. The joint work of Sir Patrick Manson and Sir Ronald Ross rendered habitable vast areas of the earth hitherto closed.

Manuzio, Aldo Pio (1450?–1515), Italian printer, founder of the Aldine press in Venice, which for just over a century issued books famed for their beautiful type and bindings.

Manzoni, Alessandro Franceso Tomaso Antonio (1785–1873), Italian writer, whose romantic novel *I Promessi Sposi* ("The Betrothed") is generally regarded as the most important work in Italian literature after "The Divine Comedy."

Mao Tse-tung (b. 1893), leader of the Chinese people. Chairman of the Central Committee of the Chinese Communist Party since 1936 and Chairman (equivalent to President) of the People's Republic of China from 1949 (when it was first established following the military defeat of the Nationalist forces) until the end of 1958 when the duties of President were relinquished.

Marat, Jean Paul (1743–93), one of the leading actors in the French Reign of Terror. Killed by Charlotte Corday.

Marconi, Guglielmo Marchese (1874–1937), Italian electrical engineer celebrated for his development of wireless telegraphy. With a home-made apparatus he sent long-wave signals over a distance of 1 mile in 1895. He came to England in 1896 and established the Marconi Company in 1897. Succeeded on Dec. 12, 1901 in transmitting and receiving transatlantic signals. Awarded Nobel Prize for Physics, 1909. The King of Italy made him a marquis in 1929.

Marco Polo. (*See* **Polo, Marco.**)

Marcus Aurelius Antoninus (121–180), the greatest of Roman emperors and a disciple of the stoics.

Maria Theresa (1717–80), Archduchess of Austria, Queen of Bohemia and Hungary; a woman of remarkable strength of character and ability, succeeded her father Charles VI., as monarch of the Hapsburg dominions. She was an enlightened ruler and has been called a "benevolent despot."

Marie Antoinette Josephe Jeanne (1755–93) was daughter of the Empress Maria Theresa and the Emperor Francis I. of Austria, and became wife of Louis XVI. of France. She entered with spirit into the gaiety of French Court life, and drew down upon herself much popular hatred in consequence. In the terrible events which followed the outbreak of the Revolution she was one of the chief sufferers, but bore her fate with dignity and resignation, and met her death on the scaffold with unflinching courage.

Marie Louise (1791–1847), daughter of Francis I. of Austria, became wife of Napoleon in 1810, and bore him a son. (*See* **Napoleon II.**)

Marius, Caius (155–86 B.C.), was one of the most distinguished Roman generals, a tribune of the people, prætor, and six times Consul. He was Proprætor of Spain in 114 B.C.

Mark Antony. (*See* **Antonius, Marcus.**)

Marlborough, John Churchill, 1st Duke of (1650–1722), brilliant soldier, the victor of Blenheim, Ramillies, Oudenarde, and Malplaquet. Married to Queen Anne's favourite, Sarah Jennings.

Marlowe, Christopher (1564–93), one of the greatest of the Elizabethan dramatists. His principal plays are *Dr. Faustus*, *Tamburlaine the Great*, *Edward II.*, and *The Jew of Malta*. He was killed in a tavern brawl at Deptford.

Marryat, Captain Frederick (1792–1848), an exceedingly popular writer of sea stories. Author of *Peter Simple*, *The King's Own*, *Jacob Faithful*, and *The Children of the New Forest*.

Marshall, General George Catlett (1880–1959), American soldier and statesman; Chief of Staff of U.S. Army, 1939–45. Initiated the American offer of aid to Europe, which led to the European Recovery Programme. Awarded Nobel Peace Prize, 1953.

Martial (Marcus Valerius Martialis) (A.D. *c.* 40–A.D. *c.* 104) was born at Bilbilis in Spain, but spent the greater part of his life in Rome, where he acquired much fame as a poet and epigrammatist.

Marvell, Andrew (1620–78), English poet, satirist and diplomatist, friend of Milton, who was best known for his many prose satires and lampoons.

Marx, Heinrich Karl (1818–83), German philosopher and socialist and lifelong partner and friend of Engels with whom he collaborated in writing many important works on socialism and in developing his theories of dialectical materialism. After being expelled from the continent he settled in London where he wrote his monumental work *Das Kapital*. Communism is based on the teachings of Marx.

Mary I. (1516–58), daughter of Henry VIII. and Catherine of Aragon. Was Queen of England from 1553 to her death. She was a strenuous Roman Catholic, and entirely reversed the religious order of things during her brief reign, persecuting, imprisoning, and burning at the stake many of the Protestant reformers, nearly three hundred persons being put to death as heretics. She married Philip of Spain in 1554.

Mary II. (1662–94), daughter of James II. Came to the English throne in 1689, having been married to her cousin, William of Orange, eleven years previously. After assenting to the "Declaration of Rights," they reigned jointly until her demise.

Mary, H.M. Queen, K.G., K.T., G.C.V.O., (1867–1953), Queen Consort of George V.

Mary, Queen of Scots (1542–87), daughter of James V. of Scotland, married to the Dauphin of France at sixteen years of age. On the death of her husband in 1560 she returned to Scotland, and for a time was the acknowledged Queen of the Scots. In 1565 she married Lord Darnley, who a year later was murdered and Mary married Bothwell. The Scottish nobles rebelled against Mary, and she was made prisoner and confined in Loch Leven Castle, compelled to abandon Bothwell and to sign an Act of Abdication in favour of her son. She escaped to England, sought the protection of Elizabeth, and was imprisoned for nineteen years in various castles, and ultimately beheaded on a charge of conspiracy. She was buried in Peterborough Cathedral but after her son James I. of England ascended the throne her remains were removed to Westminster Abbey.

Masaryk, Jan Garrigue (1886–1948), son of Thomas Masaryk. Served as Czech Minister in London, 1925–38 and as Foreign Secretary, 1940–48. His sudden and tragic death removed a cultured and lovable citizen of the world.

Masaryk, Thomas Garrigue (1850–1937), Czech philosopher and statesman; founder and first President of Czechoslovakia, 1918–35.

Mascagni, Pietro (1863–1945), the Italian composer, who attained sudden celebrity by his *Cavalleria Rusticana* in 1890, and afterwards produced a number of operas of a more ambitious character, but perhaps not up to the level of his first effort.

Masefield, John Edward, O.M. (b. 1878), Poet Laureate since 1930. A prolific writer of notable poems as well as numerous plays.

Maskelyne, John Nevil (1839–1917), famous illusionist who exposed the mysteries of the Davenport spiritualistic quacks.

Mason, Alfred Edward Woodley (1865–1948), an English novelist, author of many popular

stories of adventure including *The Four Feathers* and *Fire Over England*.

Massenet, Jules Emile Frédéric (1842–1912), French composer whose melodious compositions include songs, orchestral suites, oratorios, and 23 operas, among them *Manon* and *Thaïs*.

Massine, Léonide (b. 1896), a famous Russian dancer who was for some years Ballet Master at the Roxy Theatre, New York. Among his more famous ballets are *The Good Humoured Ladies, Boutique Fantasque, Pas d'Acier, Les Matelots, Le Beau Danube* and *Les Présages*.

Massingham, Harold John (1888–1952), English author and journalist who wrote on a wide range of subjects and was an authority on bird life and ethnology. He was a noted writer on natural history and also contributed essays to most of the leading periodicals.

Masters, Edgar Lee (1869–1950), American poet who occupies a permanent place in American literature by the publication in 1915 of his *Silver Spoon Anthology*, a hundred poems relating the real character as opposed to the eulogistic inscriptions on their tombstones of the dead in a typical American township.

Matisse, Henri (1869–1954), French painter, and one of the leading representatives of the modern school of painting in France, becoming the foremost member of a group that were known as *les Fauves*. His work is remarkable for its use of pure and brilliant colour and its reliance on colour variations to express form and relief.

Matsys or **Metzys, Quintin** (1466–1530), a distinguished Flemish painter, who was originally a blacksmith. He excelled in Scriptural subjects.

Maugham, (William) Somerset, C.H. (b. 1874), British novelist, playwright, and short-story writer. Born in Paris, he qualified as a doctor, but soon abandoned medicine for literature, achieving a great success with his first novel in 1897, *Liza of Lambeth*, a study of slum life. He has travelled widely which has given him a deep insight into human nature. As a playwright he has been equally successful. His last work *Points of View* was published in 1958.

Maupassant, Henri René Albert Guy de (1850–93), the famous French author and writer of short stories, was a friend of Flaubert, Zola, and Daudet. He was the greatest of all European short-story writers, standing alone in grace, wit and epigram.

Mauriac, François (b. 1885), French novelist whose works are regarded as among the chief literary productions of to-day. In addition to a long series of novels he has written many critical works and essays. Leader-writer for *Figaro*; Nobel Prizewinner, 1952.

Maurois, André, K.B.E. (b. 1885), French biographer, novelist and essayist who has written lives of Shelley, Disraeli, Byron, Voltaire, Fleming, and others.

Mawson, Sir Douglas, O.B.E., D.Sc., F.R.S. (b. 1882), leader of the Australian Antarctic expedition of 1911–14 and of the British-Australian and New Zealand Antarctic expedition 1929–31; previously a member of the Shackleton expedition. His party endured terrible sufferings in 1912; all died except himself. In 1913 he established a scientific station on the Macquarie Islands.

Maxim, Sir Hiram Stevens (1840–1916), the inventor of the famous automatic quick-firing gun.

Maxton, James (1885–1946), was a prominent Socialist politician; M.P. for the Bridgeton Divn. of Glasgow, 1926–46. Chairman of I.L.P. 1926–31 and 1934–39.

Maxwell, James Clerk (1831–79), Scottish physicist who wrote his first scientific paper at the age of 15. Was Professor of Natural Philosophy at Aberdeen, 1856, and for eight years held the same post at King's College, London, 1860–68. In 1871 he became the first holder of the new Professorship of Experimental Physics at Cambridge University. His best-known work is his treatise on electricity and magnetism, published in 1873. He made the discovery that founded the electro-magnetic theory of light, and to his electrical researches the advent of wireless is due.

Mazarin, Jules (1602–61), an Italian Cardinal who became chief Minister of State under Louis XIV., and was for a number of years the practical ruler of France. He succeeded Richelieu.

Mazeppa-Koledinsky, Ivan Stepanovich (1644–1709), the hero of Byron's poem, was a real personage, and a Pole, and was tied naked on the back of a wild horse, and so sent out across the Russian desert, for an intrigue with a noble's wife. He was liberated by Cossacks and afterwards attained an honourable position.

Mazzini, Giuseppe (1805–72), an Italian patriot, who, in his endeavours to secure the independence of Italy, incurred the disfavour of the authorities, and was compelled to leave the country. He started a newspaper called *Young Italy* at Marseilles, and in 1837 came to London, and kept up his attacks upon existing governments. In 1848 he was back in Rome and was elected dictator of the Roman Republic. He was not allowed to hold this position long, however, for the French occupied Rome and Mazzini was driven to England again. The unification of Italy was accomplished in other ways than those advocated by Mazzini, but he lived to see Victor Emmanuel King of United Italy.

Mehul, Etienne Nicolas (1763–1817), French operatic composer, *Joseph* being considered his masterpiece. In his early years much influenced by Gluck.

Melanchthon, Philip (1497–1560), German scholar and humanist who assisted Luther and wrote *Loci communes*, the first great Protestant work on the principles of the Reformation.

Melba, Dame Nellie, G.B.E. (1861–1931), the celebrated soprano, b. in Melbourne, who made her operatic début in Brussels in 1887.

Melbourne, 2nd Viscount (1779–1848), Queen Victoria's first premier, holding office over six years, and identified with many important Liberal measures.

Mendel, Gregor Johann (1822–84), Austrian botanist. After joining the Augustinian order, he moved to the monastery at Brünn where he afterwards became Abbot and taught natural history in the school there. His main interest, however, was the study of inheritance, and his elaborate observations of the common garden pea resulted in the famous law of heredity which to-day bears his name. His hypothesis was published in 1866 but no attention was given to it until 1900.

Mendeleyev, Dmitry Ivanovich (1834–1907), Russian chemist who made important contributions to physical chemistry and general chemical theory. First to discover the critical temperatures and formulated the Periodic Law of atomic weights. Element 101 is named after him.

Mendelssohn-Bartholdy, Jacob Ludwig) Felix (1809–47), German composer, grandson of Moses Mendelssohn, the philosopher. He belongs with Chopin and Schumann to the early 19th century classic-romantic school, and his music has a delightful delicacy and melodic beauty. He was conductor of the famous Gewandhaus concerts at Leipzig for a time and often visited England. Frequently performed are his overtures *A Midsummer Night's Dream* and *The Hebrides* (or *Fingal's Cave*), written in his youth, two oratorios *St. Paul* and *Elijah*, the violin concerto in E minor, the piano works *Variations Sérieuses* and *Songs without Words*, and the *Scotch* and *Italian* symphonies. The name Bartholdy was added to the surname when his father abandoned Jewry.

Mendès-France, Pierre, LL.D. (b. 1907), French statesman. His skilful diplomacy and energy helped to solve the many problems that faced his country when he took office as Prime Minister in June 1954. His government was overthrown on his Algerian policy in Feb. 1955. Leader of the Radical Party minority which did not support the de Gaulle constitution. Defeated in General Election Nov. 1958.

Menuhin, Yehudi (b. 1916), violin virtuoso, one of the greatest musical prodigies of the 20th century. Born in New York of Jewish parentage; made his first London appearance in the San Francisco Orchestra, 1929.

Menzies, Rt. Hon. Robert Gordon, C.H., Q.C. (b. 1894), Australian Liberal leader; Prime Minister, 1939–41 and since 1949.

Mercator, Gerhardus (1512–94), the Flemish geographer who invented a celestial and a terrestrial globe, by which he introduced his famous projection, in which meridians and parallels of latitude cross each other at right angles, both

being indicated by straight lines. This greatly simplified navigation.

Meredith, George, O.M. (1828–1909), novelist and poet, " the Grand old Man of English letters." His works are rich in imagery, poetry, wit, and characterisation, and as a delineator of womanhood he is unsurpassed. Among his great novels are *Ordeal of Richard Feverel*, *Evan Harrington*, *Rhoda Fleming*, *The Egoist*, *Diana of the Crossways*, and *The Amazing Marriage*.

Mesmer, Friedrich Anton (1733–1815), was a German doctor who founded the system of mesmerism or animal magnetism.

Mestrovic, Ivan (b. 1883), a Dalmatian sculptor, recognised as one of the leading European sculptors of the present time. The Tate Gallery and the Victoria and Albert Museum have examples of his work.

Metastasio, Pietro (1698–1782), the celebrated Italian librettist who provided texts for such composers as Gluck, Handel, Haydn, and Mozart. He lived in Vienna as court poet and his real name was Pietro Bonaventura Trapassi.

Metchnikov, Ilya (1845–1916), an eminent Russian biologist; Nobel Prize for Medicine, 1908.

Meyerbeer, Giacomo (1794–1864), was born in Germany, but spent most of his life in Paris, where he produced all his great operas, which include *Robert le Diable*, *Les Huguenots*, and *L'Africaine*.

Meynell, Alice (1849–1922), English poet and essayist, wife of **Wilfred Meynell** (1852–1948), editor of the Catholic paper *Merry England*.

Michelangelo (Michelagniolo Buonarroti) (1475–1564), the renowned Italian painter, sculptor, architect and poet, whose genius was such a power in beautifying the churches of Rome and Florence. Was the last and in some respects the greatest of the Italian sculptors; while his large paintings, particularly *The Last Judgment*, in the Sistine Chapel, are no less famous.

Michelet, Jules (1798–1874), a noted French historian and author.

Michelson, Albert Abraham (1852–1931), American physicist, born in Poland. Designer of an interferometer for estimating the diameters of stars. Collaborated with E. W. Morley in the *Michelson-Morley* experiment to measure the velocity of the earth through the " ether " which led to the conclusion that the ether is non-existent and had great value for Einstein's theory of relativity. Was the first American scientist to win the Nobel prize for Physics, 1907, in which year he was also awarded the Copley Medal.

Mickiewicz, Adam (1798–1855), greatest Polish poet and revolutionary. Chief works *The Ancestors*, *Pan Tadeusz*.

Mill, John Stuart (1806–73), achieved high reputation by his numerous works on philosophical questions. He was an ardent liberal and leader of the utilitarian school of philosophy. Radical M.P. for Westminster, 1865–68, died in Avignon. His chief works are *Principles of Political Economy*, *System of Logic*, *On Liberty*.

Millais, Sir John Everett, Bt., P.R.A. (1829–96), was at one time the most prominent of the English Pre-Raphaelites, but soon cast himself free from their mannerisms, and began the production of a long series of famous pictures. Among his numerous works we have room to mention only *The Eve of St. Agnes*, *Autumn Leaves*, *The Order of Release*, *Effie Deans*, *Chill October*, and *Bubbles*.

Millet, Jean François (1814–75), one of the greatest of French painters of pastoral subjects; his celebrated work *The Angelus* is universally known by its numerous reproductions.

Millikan, Robert Andrews (b. 1868), American physicist who is world famous for his researches on electrons, and for discovering the cosmic rays. Professor of Physics at Chicago University 1910–21, and Director of the Norman Bridge Laboratory of Physics at Pasadena, California 1921–45. Awarded Nobel Prize for Physics, 1923.

Milne, Alan Alexander (b. 1882), English humorist, poet, and playwright who has written much delightful verse and stories for children.

Milner, Alfred, Viscount (1854–1925), imperial statesman, who served in South Africa from 1897 to 1905 and had great influence on the history of that country. Was Secretary for War in 1918 and for the Colonies, 1919–21.

Miltiades (d. 489 B.C.), one of the leaders of the Athenian army against the Persians at Marathon.

Milton, John (1608–74), England's greatest epic poet, whose *Paradise Lost* is the greatest poem of the kind in the language. The best known of his other poems are probably the *Ode on the Morning of Christ's Nativity*, *L'Allegro*, *Il Penseroso*, *Lycidas*, and the sonnet *On his Blindness*. In 1652 he became totally blind, and at his death was buried in St. Giles's Church, Cripplegate, London, a monument being erected to his memory in Westminster Abbey.

Minot, George Richards, M.D. (1885–1950), an eminent American doctor who became Prof. of Medicine at Harvard in 1928, and famous for his researches in the pathology of the blood, and for his discovery of the curative properties of liver in pernicious anæmia. Shared the Nobel Prize for Medicine, 1934.

Mirabeau, Gabriel, Comte de (1749–91), one of the prominent figures of the French Revolution, and a famous orator.

Mistral, Frédéric (1830–1914), French poet who spent his whole life in Provence and wrote many works of great lyrical beauty; founded the Félibrige society (*q.v.* Gen. Inf.); completed *Lou Tresor dóu Félibrige* in 1886, a Provençal dictionary and encyclopædia of Provence. Awarded Nobel Prize for literature in 1904.

Mithridates (*circa* 132–63 B.C.), was King of Pontus from 120–63 B.C., and showed great capacity as a commander conquering a great part of Asia Minor and Greece.

Moffat, James (1870–1944), Scottish divine who translated the Bible into modern English.

Mohammed (570–632), the founder of Islam, the religion of the Moslems, fled from Mecca to Medina in 622, from which date the Mohammedan era opens. By his constant preaching and proclaiming of the one and only Deity Allah he gathered round him a small and loyal, hard-fighting band of followers and was able to return to Mecca eight years later, an acknowledged conqueror. The Sacred Book of Islam, the *Koran*—though presented by him as an original revelation from the Angel Gabriel—may in the main be traced to Biblical and Rabbinical sources.

Moiseiwitsch, Benno, C.B.E. (b. 1890), Russian-born, naturalised British pianist, especially well known for his rendering of the works of the Romantics.

Molière (Jean Baptiste Poquelin) (1622–73), the greatest of French comic dramatists, who, from being a poor strolling player, became the leading dramatist of his time. His greatest comedies were *Le Tartufe*, *Le Misanthrope*, *Le Malade imaginaire* and *Le Médecin malgré lui*.

Molotov, Vyacheslav Mikhailovitch (Skryabin) (b. 1890), Russian diplomat; succeeded Litvinov as Commissar for Foreign Affairs, 1939–49. Chief representative of the Soviet Union at numerous post-war conferences. For. Min., 1953–56; Min. of State Control, 1956–57; Ambassador to Outer Mongolia, 1957–.

Moltke, Field-Marshal Count Helmuth von (1800–91), was responsible for the Prussian strategy in the Danish, Austrian, and Franco-Prussian wars, in all of which he was outstandingly successful.

Mond, Ludwig, Ph.D., F.R.S. (1839–1909), German chemist who in 1867 settled in England as an alkali manufacturer and in partnership with John Brunner successfully manufactured soda by the Solvay process. Founded the Davy-Faraday laboratory.

Monet, Claude (1840–1926), the most representative of the French Impressionists. Exhibited in 1874 his landscape *Impression Soleil levant*, from which the word *Impressionism* was derived. Loved painting water and atmospheric effects.

Monier-Williams, Sir Monier, K.C.I.E., LL.D., Ph.D. (1819–99), a great Sanskrit scholar who laboured with distinction in bringing westward the wisdom of the Orient.

Monk, George, 1st Duke of Albemarle (1608–69), served with distinction as general and admiral, particularly in the Anglo-Dutch wars, and in 1660 effected the Restoration of Charles II.

Monroe, James (1758–1831), Fifth President of the U.S. Was appointed Governor of Virginia in 1799, and in 1803 went to France and carried through the purchase of Louisiana. Best known

as the author of the Monroe Doctrine, which he outlined in his Presidential message of 1823.

Montaigne, Michel de (1533–92), a French essayist of world-wide celebrity, who may be regarded as the inventor of the essay form, and had a great influence on English writers.

Montcalm, General Louis Joseph, Marquis de (1712–59), commander of the French Army against the British in Canada in the final struggle for possession. Defeated by Wolfe in 1759 and mortally wounded.

Montesquieu, Charles Louis de Secondat, Baron de La Brède et de (1689–1755), French philosopher and author. His works include *Les Lettres Persanes*, a witty satire on contemporary life, and his great work *L'Esprit des Lois*, setting out his ideas on politics and law. Showed a genius for generalisation and gave to history a philosophy. Greatly admired England and her constitution, which he misunderstood, and his influence on the authors of the American constitution consequently led to the impractical separation of the executive (the President) from the law-making power (Congress).

Montessori, Maria (1869–1952), M.D., D.Litt., a brilliant educationist. The "Montessori" method she invented for infant education has had wide recognition. (*See also* Gen. Inf.)

Monteverdi, Claudio (1567–1643), an Italian composer of importance by reason of his pioneer work in the operatic form. His most important dramatic work was *Orfeo* (1608).

Montezuma II. (1466–1520) was Emperor of Mexico when Cortes invaded that country, and the last Aztec ruler of Mexico.

Montfort, Simon de, Earl of Leicester (1206–65), was a powerful baron, with liberal views, and a hatred of kingly tyranny. It was his bold action that forced Henry III., his brother-in-law, to grant the first English Parliament. He met his death at the Battle of Evesham.

Montgolfier, Joseph Michel (1740–1810) and **Jacques Etienne** (1745–1799), two French brothers who, during the last twenty years of the 18th century, demonstrated the practicability of a balloon inflated by heated air, making many ascents, and may be said to be the father of modern aeronautics.

Montgomery, Field-Marshal Viscount, K.G., G.C.B., D.S.O. (b. 1887), rose to military fame as Commander of the 8th Army in the North African and Italian campaigns, 1942–44. C.-in-C. British Forces in France and Germany, 1944–46; C.I.G.S., 1946–48. Permanent Military Chairman of the Western Union Defence Committee, 1948–51; Deputy Supreme Allied Commander Europe (NATO), 1951–58. Retired 1958. His *Memoirs* were published in 1958.

Montrose, James Graham, Marquess of (1612–50), brave and inspiring Scottish general who raised the Highland clansmen for Charles I. and again for Charles II. His lyric poetry included *My dear and only love.*

Moody, Dwight Lyman (1837–99), the American revivalist preacher, associated for many years in mission work on both sides of the Atlantic with Ira D. Sankey, the "American Singing Pilgrim."

Moore, George (1852–1933), a well-known Irish novelist; author of *Confessions of a Young Man*, *Esther Waters*, *Evelyn Innes*, etc. Among his later masterpieces were *The Brook Kerith* (1916) and *Héloïse and Abelard* (1921).

Moore, Henry, C.H. (b. 1898), English sculptor, examples of whose work are to be seen in the Tate Gallery, the V. and A. Museum, and St. Matthew's Church, Northampton.

Moore, Sir John (1761–1809), British general, who trained the infantry for the Spanish Peninsular campaigns and conducted a brilliant retreat to Corunna, where he was mortally wounded after defeating the French under Soult.

Moore, Thomas (1779–1852), Ireland's greatest poet, the author of *Irish Melodies*, *Lalla Rookh*, *The Epicurean*, and many other works. He enjoyed immense popularity both in England and Ireland. Was the friend and biographer of Lord Byron.

More, Sir Thomas (1478–1535), succeeded Wolsey as Lord Chancellor under Henry VIII., but fell into disgrace by refusing to take the oath of Supremacy, and was ultimately executed. His *Utopia* is one of the world's most noted books. Canonised 1935.

Morgan, Sir Henry (c. 1635–88), Welsh buccaneer of great skill and daring; operated in the Caribbean against the Spaniards, capturing and plundering Panama in 1671. Knighted by Charles II. and made Deputy-governor of Jamaica.

Morgan, John Pierpont (1837–1913), one of the great financiers of his time who built the family fortunes into a vast industrial empire.

Morland, George (1763–1804), a painter of English rural life.

Morley, John, Viscount, O.M. (1838–1923), Liberal statesman and author, served as Secretary for Ireland in 1886 and 1892–95, and for India, 1905–10. Biographer of Gladstone, Voltaire, Rousseau, Burke, Walpole, Cromwell, and Cobden.

Morris, William (1834–96), poet and craftsman. His hatred of 19th-cent. ugliness, his belief in human equality, and in freedom and happiness for all, conspired to make him a socialist, and he accomplished much for the improvement of domestic decoration. He was a popular lecturer, founded the Socialist League and the Kelmscott Press.

Morrison of Lambeth, Herbert Stanley, Baron, P.C., C.H. (b. 1888), entered Parliament as Labour M.P. for South Hackney in 1923. Leader of the L.C.C. 1933–40. Joined the Coalition Government in 1940 and excelled as war-time Home Sec. Dep. Prime Min. and Leader of the House of Commons in the Labour administration, 1945–51. Pub. *Government and Parliament* (1954). Resigned from parliamentary life in 1959; life peerage conferred, 1959.

Morse, Samuel Finley Breese (1791–1872), an American artist and designer, who became the inventor of the Morse system of electric telegraphs, and of the Morse code of signals.

Mountbatten of Burma, 1st Earl, Admiral of the Fleet, P.C., K.G., G.C.B., G.C.V.O., D.S.O. (b. 1900), naval officer and statesman. Chief of Combined Operations, 1942–43; Supreme Allied Commdr. S.E. Asia, 1943–46; Viceroy of India, Mar.–Aug. 1947 and first Gov. Gen. of Dominion of India, Aug. 1947–June 1948. Resuming his naval career in 1948 he has served successively as Flag Officer Commanding the 1st Cruiser Squadron, Mediterranean, Fourth Sea Lord, C.-in-C. Mediterranean, C.-in-C. Allied Forces, Mediterranean, and First Sea Lord and Chief of Naval Staff, 1955–59, Chief of the Defence Staff, 1959. **Lady Mountbatten** (d. 1960) was before her marriage the Hon. Edwina Ashley, granddaughter of Sir Ernest Cassel, the financier. She took an active part in welfare work, and as the last vicereine of India played a notable part with her husband in the transition of India to independence. She was buried at sea.

Mountevans, Admiral Lord, K.C.B., D.S.O., (1881–1957), "Evans of the Broke," British sailor and explorer. Author of *South with Scott.*

Mussorgsky, Modest Petrovich (1839–81), Russian composer whose masterpiece is the opera *Boris Godunov* after the play by Pushkin. His piano suite *Pictures at an Exhibition* was orchestrated by Ravel.

Mozart, Wolfgang Amadeus (1756–91). The composer who bears this immortal name is universally acknowledged as the world's greatest musical genius. He was born at Salzburg, began his musical career at the age of four, toured the European courts as an infant prodigy, left the service of the Archbishop of Salzburg in his twenty-sixth year to live in Vienna, where his friendship with Haydn began and where his greatest music was written. Mozart's genius lies in the effortless outpouring of all forms of music, in the ever-flowing melodies, in the consistent beauty and symmetry of his compositions, and in the exactness of his method. Among the loveliest and grandest works in instrumental music are his three great symphonies in E flat, in G minor, and in C (called the "Jupiter"), all written in six weeks in 1788. Three of the greatest operas in musical history are his *Marriage of Figaro* (1786), *Don Giovanni* (1787), and *The Magic Flute* (1791). His last composition, written under the shadow of death, was the Requiem Mass, a work of tragic beauty.

Müller, Ferdinand von, Baron (1825–96), German botanist and explorer. Director of the Botanical Gardens at Melbourne, 1857–73. Intro-

duced the eucalyptus into the south of Europe and other regions, and took leading part in promoting Australian exploration.

Munkacsy, Michael von (1844–1900), a celebrated Hungarian painter of historical subjects.

Munnings, Sir Alfred James, K.C.V.O., P.R.A. (1878–1959), British painter whose country scenes and pictures of horses have gained him world-wide fame. P.R.A., 1944–49.

Murdock, William (1754–1839), engineer and inventor, one of the first to introduce gas lighting.

Murillo, Bartolomé Esteban (1617–82), one of the greatest Spanish painters. His chief works are altar-pieces and religious subjects.

Murray, (George) Gilbert (Aime), O.M., D.Litt., D.C.L., LL.D. (1866–1957), classical scholar and humanist whose verse translations of Euripides are known throughout the world. Became Professor of Greek at Glasgow at early age of 23; Regius Professor of Greek at Oxford, 1908–36; Chairman of the League of Nations Union, 1923–38; and President of the United Nations Association until his death.

Mussolini, Benito (1883–1945), Fascist dictator of Italy from October 1922 until July 1943. From 1935 an aggressive foreign policy in Abyssinia, Spain, etc., was at first successful, and in June 1940, he entered the second world war on the side of Germany. The defeat of Italian arms in North Africa and the invasion of Sicily caused the collapse of his Government, but he was rescued from imprisonment by parachutists. Executed two years later by partisans.

N

Nansen, Fridtjof, G.C.V.O., D.Sc., F.R.G.S. (1861–1930), the Norwegian explorer who, after two or three expeditions across Greenland, in 1893 started out on his famous North Polar expedition when he reached the highest latitude until then attained—86° 14′—a feat later eclipsed by the Duke of the Abruzzi and by Peary, as well as by airship or aeroplane. He published a fascinating narrative of his exploration under the title of *Farthest North*. Active in Russian famine relief, 1921. Awarded Nobel Prize for Peace, 1922.

Napier, John (1550–1617), mathematician, who made important contribution to the advance of astronomy and other branches of science by his invention of logarithms (published 1614).

Napoleon I. (Bonaparte) (1769–1821) was born at Ajaccio in Corsica. Sent to France to receive a military education and was a captain at the age of twenty. In 1794 served in Italy with such distinction that he won a generalship, and next year was appointed Commander-in-Chief. A series of most brilliant successes followed. He defeated the Austrian forces in 1797, conducted an expedition to Syria and Egypt in 1798, returned in 1799 to find himself the most popular man in France, and in November of that year he proclaimed himself First Consul. In 1800 he was again in Italy and once more victorious. In 1804 he was made Emperor, and the following year was in the field against England, Russia, and Austria, achieving a splendid series of victories at Austerlitz and elsewhere, and practically became Dictator of Europe, distributing kingships amongst his brothers in the most profuse manner, Joseph becoming King of Naples, Louis King of Holland, and Jerome King of Westphalia. His invasion of Russia was disastrous, the Peninsular War went against him, and in 1814 the Allies entered Paris and forced him to abdicate. He was sent to Elba, but made his escape in the following year, gathered his old army about him and went forth to meet the English and Prussian armies. He was finally completely defeated at Waterloo on the 18th June, 1815, and exiled to St. Helena, where he died six years later. His remains were removed to Paris in 1840, and rest in a magnificent tomb.

Napoleon II. (1811–32) was the son of Napoleon I. and Maria Louisa. Was born in Paris and proclaimed King of Rome, but died of consumption when only twenty-one, being known at the time of his demise as the Duke of Reichstadt.

Napoleon III. (1808–73) was the son of Louis Bonaparte, King of Holland, and of Hortense, daughter of the Empress Josephine. After unsuccessful attempts to secure the French throne and years of imprisonment he took advantage of the revolution of 1848 to return to France and, following the famous *coup d'etat* of December 2, 1851, emerged as master of France and was proclaimed Emperor the following year. Married Eugénie de Montijo in 1853. Dictatorial and discredited at home, unsuccessful in his foreign adventures, his surrender at Sedan in the Franco-Prussian war of 1870 brought ruin to the Second Empire, and France once again became a republic. Louis Napoleon took refuge in England and died at Chislehurst in Kent.

Nash, John (1752–1835), architect. Planned Regent Street, laid out Regent's Park, enlarged Buckingham Palace, and designed Marble Arch and the Brighton Pavilion.

Nash, Paul (1889–1946), distinguished English painter and designer. Official war artist in both world wars. Best known pictures *The Menin Road* of 1918 and *Totes Meer* of 1941.

Nash, Rt. Hon. Walter (b. 1882), New Zealand Labour politician; Prime Min., 1957–.

Nasmyth, James (1808–90), the inventor of the steam-hammer, which became indispensable in all large iron and engineering works.

Nasir (Nasser) Col. Gamal Abd al- (b. 1918), first President of the first Egyptian Republic and influential leader of the Arab world. Fought in Palestine War of 1948–49 and organised the military *coup* of July 23, 1952, which brought the abdication of King Farouk. President of the United Arab Republic (Egypt and Syria), 1958.

Nehru, Pandit Jawaharlal (b. 1889), Indian statesman and one of the world's great leaders; Prime Min. and Min. of Foreign Affairs since 1947. Educated at Harrow and Cambridge where he studied science and law. A leading member of the Congress Party for many years, during which he was frequently imprisoned for his political activities. Played distinguished part in the final negotiations for the independence of India. Since 1947 under his inspiring leadership India has made dramatic technical, industrial, and social advances. As a believer in non-violence and non-interference with other countries he has had notable success as a peacemaker in Korea, Indo-China, and the Middle East.

Nelson, Horatio, Viscount, K.C.B. (1758–1805), the great English naval commander; son of a Norfolk clergyman. Went to sea at twelve years of age, and was post-captain at twenty-one. In 1793 he was captain of the *Agamemnon* and proved his capacity and daring against the French. He lost his right eye at the siege of Calvi in 1794, and his right arm at the siege of Santa Cruz in 1797. In 1798 he achieved a great victory over the French in Aboukir Bay, in recognition of which he was created a Baron and granted a pension of £2,000 a year. He was victorious at Copenhagen in 1801, after which he was promoted to the rank of Viscount. In 1805 occurred the Battle of Trafalgar, in which the French fleet was destroyed and Nelson was killed. He was buried in St. Paul's Cathedral.

Nenni, Pietro (b. 1883), Italian politician and Secretary-General of the Italian Socialist Party since 1944. Minister of Foreign Affairs, 1946–47.

Nernst, Walther Hermann (1864–1941), German scientist who established the third law of thermodynamics. Nobel Prizeman, 1920.

Nero, Claudius Cæsar (A.D. 37–68), the Roman Emperor whose reign of fourteen years was rendered infamous by his cruelty and licentiousness.

Newall, Marshal of the R.A.F. Lord, G.C.B., O.M. (b. 1886), Chief of the Air Staff, 1937–40. Gov.-Gen. of New Zealand, 1941–46.

Newcomen, Thomas (1663–1729), was one of the first to put a steam-engine into practical operation, and in 1705 patented his invention, which was the pumping-engine used in Cornish mines until the adoption of Watt's engine.

Newman, Ernest (1868–1959), English music critic successively of *The Manchester Guardian*, *The Birmingham Post*, *The Observer*, and of *The Sunday Times*, 1920–58. Outstanding among his numerous writings is the *Life of Richard Wagner*.

Newman, John Henry, Cardinal (1801–90). Educated at Oxford, he was incumbent of St. Mary's there from 1828 to 1843, taking an active part in the religious discussions of the time, gradually showing a tendency to adopt Roman Catholic

views, and ultimately allying himself with the Romanists, resigning his living and settling at Edgbaston, Birmingham, as the head of a community of the Order of St. Philip Neri. Here he remained for the rest of his career, devoting himself to an almost monastic life, but from time to time employing his pen in the production of religious works, displaying great controversial power, beauty of thought, and charm of style. In his *Apologia pro Vita Sua* he described the development of his religious thought. The beautiful hymn *Lead, kindly Light*, and the *Dream of Gerontius* were written by him.

Newton, Sir Isaac, F.R.S. (1642–1727), generally acknowledged as the world's greatest man of science. Achieved immortal fame for his work on the nature of white light, the calculus and gravitation Greatest published work, the *Principia*, was produced in 1687, revolutionising the scientific thought of his time. Was Member of Parliament for Cambridge in 1688, Master of the Mint in 1699, and President of the Royal Society from 1703 till his death. Honoured with knighthood in 1705.

Ney, Marshal Michel (1769–1815), was one of Napoleon's most noteworthy generals.

Nicholas II., Ex-Czar of Russia (1868–1918), son of the Emperor Alexander III. Came to the throne in 1894, and had a reign full of trouble, being unable to handle the difficulties by which he was beset. He avowed full harmony with the British and French in the war which opened in 1914, but the acts of the Empress and Court belied these pretensions, and a Revolution resulted in March, 1917, which overthrew the Romanoffs. Nicholas was detained a prisoner together with the Czarina and his children; all were probably shot on July 16, 1918.

Nicholas, St., Bishop of Myra and patron saint of Russia, flourished in the 4th century, and is popularly associated with Christmas under the corrupted name of Santa Claus.

Nicholson, Sir William (1872–1949), English painter, well known for his portraits, engravings and woodcuts as well as for his illustrations in the *Almanack of Twelve Sports* (with Kipling) and *London Types* (with Henley). His son, **Ben Nicholson** (b. 1894), also an artist, is noted for his abstract paintings.

Nicolson, Hon. Sir Harold, K.C.V.O., C.M.G. (b. 1886), author and critic, whose books include *The Congress of Vienna* (1946), *King George V.: His Life and Reign* (1952), *The Evolution of Diplomatic Method* (1954), *Good Behaviour* (1955). Married to the **Hon. Victoria Sackville-West** (b. 1892), the novelist and poet.

Niemöller, Martin (b. 1892), German religious leader. A pastor in the Evangelical (Protestant) Church. Actively opposed the Nazification of the German Church and was incarcerated in a concentration camp throughout the second world war.

Nietzsche, Friedrich Wilhelm (1844–1900), German philosopher, in his younger years greatly influenced by the work of Wagner and Schopenhauer. His "superman" philosophy is eloquently expressed in his many writings, *i.e., Thus spake Zarathustra, Beyond Good and Evil, The Will to Power.*

Nightingale, Florence, O.M. (1820–1910), English nurse and pioneer of hospital reform whose genius for administration was shown during the Crimean War, when she organised in face of considerable official opposition a nursing service to relieve the sufferings of the British soldiers who called her "The Lady with the Lamp." Her system was adopted and developed in all parts of the world, and she was honoured with a testimonial of £50,000, which she applied to the founding of the Nightingale Training School for Nurses, attached to St. Thomas's Hospital, London.

Nijinsky, Vaslav (1892–1950), Russian dancer, who was one of the famous company of dancers, which included Pavlova, Karsavina and Fokine, brought by Diaghilev to Paris and London just before the War of 1914–18, and was in some respects the most remarkable of them all. His sensational dancing in such Ballets as *Les Sylphides, Spectre de la Rose* and *Après-Midi d'un Faune* won him the supreme place among male dancers.

Nikisch, Arthur (1855–1922), famous Hungarian conductor, who appeared as a prodigy pianist at the age of eight, became chief conductor at the Leipzig Opera, 1879, conducted the Symphony Orchestra at Boston, 1889–93, afterwards paying visits to all the important cities of Europe.

Nkrumah, Kwame, M.A. M.Sc., LL.D. (b. 1909), Prime Minister of Ghana (formerly the Gold Coast) which celebrated its emergence as an independent state on March 6, 1957, the first African colonial country to do so.

Nimitz, Admiral of the Fleet Chester William (b. 1885), commanded the American fleet in the Pacific, 1941–45, together with army and marine forces. Chief of Naval Operations, 1945–47.

Nobel, Dr. Alfred Bernhard (1833–96), the inventor of dynamite, was a Swedish engineer and chemist who amassed a large fortune from the manufacture of explosives, a great portion of which at his death in 1896 he set apart as a fund for annual prizes to such persons as during each year shall have contributed most materially to the benefit of mankind. There are five of these prizes, and they are given in the following departments: physics, chemistry, physiology or medicine, literature, and peace.

Norrie, 1st Baron Lieut-Gen. (Charles) Willoughby (Moke), G.C.M.G, G.C.V.O., C.B., D.S.O., M.C. (b. 1893), Gov.-Gen. and C.-in-C. of New Zealand, 1952–57; Governor South Australia. 1944–52. Professional cavalry officer.

Norstad, Gen. Lauris (b. 1907), succeeded Gen Gruenther as Supreme Allied Commander, Europe, 1956.

Northcliffe, 1st Viscount (1865–1922), was one of the most prominent men in modern journalism Started *Answers* in 1888 with his brother, Cecil Harmsworth. In 1894 the Harmsworths purchased the *Evening News*, and in 1896 they started the *Daily Mail.* In 1917 was special British representative in the United States.

Northumberland, John Dudley, Duke of (1502–53), an expert intriguer who dominated the Government of Edward VI. from 1549 onwards and attempted to maintain his influence when the king died by proclaiming as Queen his daughter-in-law, Lady Jane Grey, but failed and was executed.

Nostradamus or **Michel de Notre Dame** (1503–66), French astrologer who acquired great distinction by his labours during the plague. Publ. in 1555 *Centuries*, a book of rhymed prophecies, the fulfilment of some of which greatly added to his reputation. *Centuries* was condemned by the papal court of 1781.

Novalis, the pseudonym of **Baron Friedrich von Hardenberg** (1772–1801), German poet and novelist, representative of German romanticism. His chief work was the novel *Heinrich von Ofterdingen*, unfinished at his death.

Noyes, Alfred, C.B.E., LL.D., Litt.D. (1880–1958), English poet, whose first book of verse, *The Loom of Years*, was published in 1902.

Nuffield, 1st Viscount, William Richard Morris, G.B.E., C.H. (b. 1877), industrialist and philanthropist and until he retired in 1952 Chairman of Morris Motors, Ltd. Established the Nuffield Foundation, endowing it with £10 million, and provided large sums for the advancement of medicine in the University of Oxford.

Numa Pompilius was according to tradition, the second King of Rome and the founder of Roman Ceremonial Law.

O

Oaksey, Geoffrey Lawrence, 1st Baron, P.C., Q.C., D.S.O. (b. 1880), presided over the International Military Tribunal which tried the major war criminals at Nuremberg, 1945–46. A Lord of Appeal in Ordinary since 1947.

Oates, Captain Lawrence Edward Grace (1880–1912), a British explorer who, having seen active service in the South African War, joined Capt. Scott's Antarctic Expedition in 1910. He was one of the sledge party who accompanied Scott in his final dash for the South Pole. On returning, the party became stormbound, and on March 17, 1912, Oates, crippled by frost-bite, went out in the blizzard to die rather than be a burden to his starving comrades. Described in Scott's diary as a very gallant gentleman.

Oates, Titus (1649–1705), a notorious informer against Roman Catholics in reign of Charles II.

O'Casey, Sean (b. 1883), Irish dramatist of re-

markable powers whose plays include *Juno and the Paycock*, *The Silver Tassie*, *Red Roses for Me*, and *Oak Leaves and Lavender*.

Occam (Ockham), William of (*c*. 1270–1349), English scholar and philosopher and one of the most interesting, independent and original thinkers of all time. He belonged to the Order of Franciscans, violently opposed the temporal power of the Pope, espoused the cause of nominalism and laid the foundations of modern theories of government and theological scepticism. He was styled "the Invincible Doctor."

O'Connell, Daniel (1775–1847), the Irish "Liberator," as he was called, was a famous orator and politician and a highly successful barrister. In Parliament he advocated the cause of Ireland with courage and audacity.

O'Connor, Feargus (1796–1855), was an Irish lawyer who became the most influential figure in the Chartist movement.

O'Connor, Rt. Hon. Thomas Power (1848–1929), sat in Parliament from 1880 until 1929, being for many years father of the house, and was one of the most successful journalists and editors of his time. He founded several publications including the *Star* and originated the "Book of the Week" idea.

Oersted, Hans Christian (1777–1851), the Danish philosopher and scientist, whose discoveries in electrical research did much to help forward the invention of the electric telegraph.

Offa was King of Mercia from *circa* 757 to 796, and had a war-like career; he built an embankment from the Dee to the Wye, 100 miles long, which was called Offa's Dyke. He imposed "Peter's Pence" as a gift to the Pope for absolution.

Offenbach, Jacques (1819–80), French composer, born of a Jewish family at Cologne. Was the composer of many light operas, including the posthumous *Les Contes d'Hoffmann* (*Tales of Hoffmann*), the most popular of all his works.

Ohm, Georg Simon (1787–1854), was the discoverer of a law of electric current now known universally as Ohm's law. He was a native of Bavaria, professor at Munich from 1852, and gained much fame as a physicist and mathematician.

O'Kelly, Sean T. (b. 1882), Pres. of Republic of Ireland, 1945–59.

Olivier, Sir Laurence Kerr (b. 1907), British actor and producer, has appeared with great success in many Shakespearean and other rôles. Played in the films of *Wuthering Heights*, *Rebecca*, *Pride and Prejudice*, *49th Parallel*, *Henry V.*, *Hamlet* and *Richard III*. He is married to Miss Vivien Leigh, stage and film actress.

Oman, Sir Charles (William Chadwick), K.B.E. (1860–1946), English historian who was Chichele Professor of Modern History at Oxford, 1905–46 and M.P. for the University from 1919 to 1935. His works include a popular *History of Greece*, *A Short History of England*, which is a familiar school book, and a *History of the Art of War in the Middle Ages*.

Omar I. (581–644) was second Caliph of the Mohammedans, and the first to be designated the Commander of the Faithful. He conquered Syria, Mesopotamia, Persia, Egypt, and Palestine, reigned from 634–644, and died at the hands of a slave.

Omar Khayyám (*c*. 1050–1132), Persian poet and mathematician, called Khayyám (tent-maker) because of his father's occupation. His fame as a scientist has been eclipsed by his Rubaiyat, made known to English readers by Edward FitzGerald in 1859.

O'Neill, Eugene Gladstone (1888–1953), an American playwright who, after spending his adventurous youth in such activities as sailing, gold-prospecting, and journalism, first won success in 1914 with the one-act play, *Thirst*. His later plays include *Beyond the Horizon*, *Anna Christie*, *Strange Interlude*, and *Mourning Becomes Electra*. The Pulitzer Prize for drama was posthumously awarded to him for his play *Long Day's Journey into Night*.

Opie, John, R.A. (1761–1807), a celebrated English painter whose historical pictures were highly valued in his day.

Orchardson, Sir William Quiller (1835–1910), an eminent R.A.; among his best-known works are *Napoleon I. on board H.M.S. Bellerophon* and *Ophelia*.

Orpen, Sir William, K.B.E., R.A. (1878–1931), British portrait-painter; many of his celebrated war pictures were presented to the nation.

Osler, Sir William, Bt., M.D., F.R.S. (1849–1919), British physician, born in Canada, was an authority on diseases of the blood and spleen, and wrote on nearly every branch of medicine, his works including *Principles and Practice of Medicine*, and the *Evolution of Modern Medicine*.

Oswald, St., King of Northumbria from 625 to 642, established Christianity amongst his subjects.

"Ouida" (Mlle. Marie Louise de la Ramée) (1839–1908), an English novelist, born at Bury St. Edmunds of French extraction, whose works have been highly popular.

Otto, Nikolaus August (1832–91), German engineer and inventor of the four-stroke cycle that bears his name.

Otto the Great (912–973), son of Henry the Fowler, crowned King of the Germans at Aachen in 936 and Emperor at Rome in 962. Overawed the papacy, checked the barbarian invasions, founded the East Mark (Austria), and considerably consolidated Germany.

Ovid (43 B.C.–A.D. 18), the famous Latin poet (Publius Ovidius Naso) whose *Metamorphoses* and *Art of Love* are among the best-known examples of Roman literature of the lighter kind.

Owen, Robert (1771–1858), socialist and philanthropist, devoted his life and fortune to the carrying out of his theories, and established socialistic colonies in Lanarkshire, Hampshire and America.

P

Pachmann, Vladimir de (1848–1923), Russian pianist, an unrivalled interpreter of the works of Chopin.

Paderewski, Ignace Jan (1860–1941), achieved unrivalled fame as a pianist and for half a century worked for the freedom of his native Poland. He represented his country at Versailles and became her first Prime Minister. Later he resumed his musical career and died in exile during the Second World War.

Paganini, Niccolo (1782–1840), Italian violinist and composer whose playing became a legend and brought him much fame and wealth. He ranks as first among virtuosi of the violin.

Paine, Thomas (1737–1809), English revolutionary author, lived, wrote and held a number of positions in America from 1774 to 1787. Wrote his famous *Rights of Man* as a reply to Burke's *Reflections on the Revolution in France*. It had an enormous circulation, but the Government prosecuted him for alleged sedition, and he fled to France. In 1793 he published the *Age of Reason*.

Palestrina, Giovanni Pierluigi da (*c*. 1525–94), great Italian composer of unaccompanied church music and madrigals, among whose works are the *Missa Papae Marcelli* and the *Stabat Mater* for 8 voices, which is among the greatest musical glories of all time.

Palgrave, Sir Francis (1788–1861), a much-esteemed historian, who wrote *The Rise and Progress of the English Commonwealth*, *A History of Normandy*, and *A History of the Anglo-Saxons*. He was knighted in 1832. His son, **Francis Turner Palgrave** (1824–97), was a poet of devotional instincts, who was Professor of Poetry at Oxford, and edited the much-esteemed *Golden Treasury*. Another son, **William Gifford Palgrave** (1826–88), was a traveller, diplomatist, and prose writer of considerable ability.

Palissy, Bernard (*circa* 1510–89), a distinguished French potter, who after years of struggle and self-denial discovered the art of producing white enamel, after which he became famous and set up a porcelain factory in Paris, which was patronised by Royalty.

Palladio, Andrea (1518–80), the great Italian architect, who introduced the style of architecture known as Palladian.

Palmer, John (1742–1818), originator of the mail-coach postal service in 1784.

Palmerston, Henry John Temple, 3rd Viscount (1784–1865), English statesman, was long dominant in European affairs because of his vigorous and popular policy. He spent many years of his life in office, serving as Tory Secretary for War from 1808 till 1828 as

Foreign Secretary in all the Whig cabinets between 1830 and 1851, and as Prime Minister in 1855 and from 1859 until his death. He had a lofty conception of the strength and duties of England and was the irreconcilable foe of oppression and injustice.

Pancras, St., the patron saint of children, was the son of a Roman noble, was baptised in Rome in the reign of Diocletian, where he was put to death at the age of fourteen for refusing to renounce Christianity.

Pandit, Vijaya Lakshmi (b. 1900), Indian High Commissioner in London, 1954– . India's first Ambassador to the Soviet Union (1947–49) and to the United States (1949–51), the first woman to be elected Pres. of the United Nations General Assembly (1954) and to be head of a diplomatic mission in London. Sister of **Jawaharlal Nehru**.

Panizzi, Sir Anthony, K.C.B. (1797–1879), an Italian political exile, who in 1831 was appointed to the Assistant Librarianship and Keepership of the Printed Books of the British Museum. In 1856 he became Principal Librarian, retiring in 1866. The great Reading Room was constructed from his designs.

Pankhurst, Emmeline (1858–1928) was a prominent and indefatigable worker for women's suffrage, together with her daughters Dame Christabel and Sylvia.

Papin, Denis (1647–1714), a French mathematician and scientist who settled in England. He invented the condensing pump, and was a pioneer in the development of the steam engine. Not being a mechanic, he made all his experiments by means of models.

Paracelsus, Philippus Aureolus (1493–1541), a famous Swiss mystic and alchemist. He made numerous important discoveries, being the first to employ laudanum and antimony in pharmacy. The English translation of his *One Hundred and Fourteen Experiments and Cures* appeared in 1596. His real name was Theophrastus Bombastus von Hohenheim.

Park Mungo (1771–1806), famous British traveller who in 1799 published an arresting account of his *Travels in the Interior of Africa*.

Parker, Rev. Joseph (1830–1902), a popular Nonconformist preacher and author who built the City Temple, and ministered there up to the time of his death.

Parnell, Charles Stewart (1846–91), the Irish politician, who as leader of the Nationalist Party made it more powerful than it had ever been and successfully enlisted the support of Gladstone for the policy of Home Rule. Accused by *The Times* of complicity in the crimes of the Land League on the basis of letters forged by Richard Pigott, he was completely vindicated by a Royal Commission and awarded heavy damages. Was dropped from the leadership of his party following the O'Shea divorce proceedings and died soon afterwards.

Parry, Rear-Admiral Sir William Edward (1790–1855), an Arctic explorer and naval commander of great distinction, who undertook several expeditions to the Polar regions and made numerous important discoveries.

Parsons, Hon. Sir Charles Algernon, O.M., K.C.B., F.R.S. (1854–1931), was head of the electrical and engineering works of C. A. Parsons and Co., and of the Parsons Marine Steam Turbine Co., Ltd., Newcastle-on-Tyne, and inventor of the steam turbine which has effected a remarkable improvement in the propulsion of war and mercantile vessels.

Partridge, Sir Bernard (1861–1945), began life as a stained glass designer, afterwards worked at book illustrations, and for a time was on the stage. Joined *Punch* staff 1891, and for many years was its principal cartoonist.

Pascal, Blaise (1623–62), a noted French philosopher whose *Provincial Letters* exhibit remarkable wit and genius. A distinguished mathematician, he invented an ingenious arithmetical machine, besides making many brilliant experiments in hydrostatics and pneumatics.

Pasternak, Boris Leonidovich (b. 1890), Russian poet and writer. Translations of his great novel *Dr. Zhivago* appeared in 1958, though it was forbidden in the Soviet Union. In that year he was awarded—though he declined it—the Nobel Prize for Literature "for his important contributions both to contemporary lyric poetry and to the great Russian narrative tradition."

Pasteur, Louis (1822–95), French chemist, whose work was inspired by an interest in the chemistry of life which abided with him until his death. His researches on fermentation led to the science of bacteriology and his investigations into infectious diseases and their prevention to the science of immunology. The pathological bacteriological import of Pasteur's researches came about mainly through his disciples (Lister, Roux, and others) and not directly, though all founded on his early non-medical investigations on organisms of fermentation, etc., which were of great importance in industry, and fundamentally. He spent most of his life as administrator and director of scientific studies at the École Normale at Paris, where he was appointed in 1857. The Institut Pasteur was founded in 1888.

Patmore, Coventry (1823–96), poet of the Victorian era, and author of *The Angel in the House*.

Paton, Sir (Joseph) Noel, R.S.A., LL.D. (1821–1901), sculptor, historical artist, archæologist, and poet.

Patrick, St. (*c.* 387–*c.* 463), the patron saint and Apostle of Ireland, was for many years a great and successful Christian missionary in that country. Few authentic facts about his life are known, but many miraculous stories, such as his alleged extermination of serpents in the island, have been associated with him.

Patti, Adelina Juana Maria (Baroness Cederström) (1843–1919), Italian soprano singer, was born in Madrid. Her marvellous voice and brilliant execution made her immediately famous.

Pattison, Dorothy Wyndlow (1832–78), a sister of Mark Pattison, who devoted a great part of her life to hospital work in Walsall, where, as "Sister Dora," she is revered for her saintly life and devotion to the sick poor.

Pattison, Mark (1813–84), scholar and critic, rector of Lincoln College, Oxford. His wife was **Emilia Francis Strong** (afterwards Lady Dilke), well known as a French art historian and for her work in promoting trade unionism among women workers.

Pavlov, Prof. Ivan Petrovich (1849–1936), an eminent Russian physiologist: Director of the Physiological Institute. Foreign member of the Royal Society and Nobel Prize-winner.

Pavlova, Anna (1885–1931), one of the greatest exponents of the Russian school of dancing.

Peabody, George (1795–1869), an American merchant who lived for the greater part of his life in London, and, acquiring a large fortune, bequeathed immense sums for philanthropic purposes in England and the United States.

Peacock, Thomas Love (1785–1866), English satirist, whose novels include *Headlong Hall* and *Nightmare Abbey*, and who ranks high in English literature for the wit and grace of his style.

Pearson, Sir Cyril Arthur, Bt. (1866–1921), journalist and newspaper proprietor, who founded *Pearson's Weekly*, *The Daily Express*, and other publications. Later retired from business because of blindness and devoted himself to the welfare of other blind people, particularly ex-servicemen, being the founder of St. Dunstan's.

Pearson, Lester Bowles, O.B.E., M.A. (b. 1897), Canadian Minister for External Affairs, 1948–57. Awarded 1957 Nobel Peace Prize.

Peary, Rear-Admiral Robert Edwin (1856–1920), an American Arctic explorer who, in 1891–92, conducted a sledging expedition towards the Pole. In 1893, 1895, and 1898 was again in the Arctic regions; and in 1900–02 reached the highest latitude hitherto attained. In the spring of 1906 he touched 87 degs. 6 min. N. latitude. On April 6, 1909, making the journey by sledge over sea-ice and accompanied by only his native servant, he succeeded in reaching the Pole.

Peel, Rt. Hon. Sir Robert, 2nd Bt. (1788–1850), a prominent British statesman who entered Parliament at twenty-one years of age, and immediately exhibited great capacity, being appointed Under-Secretary for the Colonies in the following year. From 1812 to 1818 he was Secretary for Ireland; and in 1822 he became Home Secretary, introducing, whilst fulfilling that office, the new police service associated with his name. In 1834, Peel was for four months Prime Minister,

and in 1841 formed a second ministry. It was then that the Anti-Corn Law agitation became formidable, and Peel abandoned his former Protectionist attitude, and carried his Repeal measure eventually in 1846. He was thrown from his horse in Hyde Park on June 25th, 1850, and died from injuries.

Penfield, Wilder Graves, O.M., M.D., M.A., D.Sc., F.R.S. (b. 1891), Canadian brain surgeon; Dir. Montreal Neurological Institute; Prof. of Neurosurgery McGill Univ.; Pub. *The Cerebral Cortex of Man* (1950), *Epilepsy and the Functional Anatomy of the Human Brain* (1954).

Penn, William (1644–1718), became a Quaker, and wrote some powerful pamphlets supporting his new faith. He devoted himself to good works, and in 1682, having obtained a special grant from King Charles II., went to America and founded Pennsylvania.

Penney, Sir William George, K.B.E., M.A., Ph.D., D.Sc., F.R.S. (b. 1909), British scientist; Dir. Weapons Group, Atomic Weapons Research Establishment, Aldermaston; succeeded Sir John Cockroft as Member (Scientific Research) of the U.K. Atomic Energy Authority in 1959.

Pepys, Samuel, F.R.S. (1633–1703), naval administrator, sometimes called the "Father of the British Civil Service." The *Diary* was written while he was a comparatively young man and is a unique revelation of a man and his age, besides including eye-witness descriptions of the Great Plague and Fire of London.

Pergolesi, Giovanni Battista (1710–36), Italian composer, best known for his humorous opera *La Serva Padrona* and his *Stabat Mater*.

Pericles (*c.* 490–429 B.C.), the distinguished Athenian statesman, general, and orator, who raised Athens to the point of its fullest prosperity.

Perkin, Sir William Henry, F.R.S., D.Sc. (1838–1907), great organic chemist and famous for his discovery of mauve, the first synthetic dye.

Perkin, William Henry (junior) (1860–1929), foremost organic chemist of his day; Professor of Organic Chemistry at Manchester University, 1892–1912 and later at Oxford. His researches led to important industrial results.

Perrin, Francis (b. 1901), French scientist and socialist; succeeded Joliot-Curie as High Commr. for Atomic Energy in 1951. Prof. Atomic Physics, Collège de France, 1946–.

Persius Flaccus, Aulus (A.D. 34–62), a famous Stoic philosopher.

Perugino, Pietro (1446–1524), Italian artist who excelled in religious subjects and painted many fine frescoes including some in the Sistine Chapel at Rome. Raphael was his pupil.

Pestalozzi, Johann Heinrich (1746–1827), was a rich Swiss reformer and writer, who devoted his fortune to benevolent works, especially in connection with the education of poor children.

Pétain, Marshal Henri Phillipe (1856–1951), became a French national hero after the successful defence of Verdun in 1916 and was made C.-in-C. of all the French armies. In 1940 he became Prime Minister, signed an armistice with Germany, and set up a quasi-independent administration at Vichy. In 1945 he was sentenced to death for treason, the sentence being commuted to life imprisonment.

Peter I, called The Great (1672–1725). Czar of Russia, showed great ability and energy of character, devoting himself largely to the reorganisation of his army and navy. He spent some months at Deptford studying shipbuilding. He founded St. Petersburg (1703), which was his "window on to Europe," and gained control in the war with Sweden of Karelia, Ingermanland, and Livonia. Among the prisoners taken by him at the Battle of Poltava (1709) was Catherine Skavronsky, daughter of a Lithuanian peasant, whom he later married. By her care and understanding she did much to strengthen his power. Peter died without naming an heir, and Catherine became Empress of Russia (1725–27).

Peter, the Hermit (*c.* 1050–1115), was the main instrument of the agitation which brought about the first Crusade. He was a French monk, of great eloquence and earnestness, and lived to see Jerusalem in the hands of the Christians.

Petrarch, Francesco (1304–74), Italian poet and scholar, whose odes and sonnets *To Laura* are unmatched for their lyrical beauty and passion.

Petrie, Sir (William Matthew) Flinders, F.R.S. (1853–1942), British egyptologist who became interested in archæological research at a very early age. He carried out excavations in Britain (1875–90), Egypt (1880–1924), and Palestine (1927–38), and wrote many books on the prehistoric civilisation of Egypt. Edwards Professor of Egyptology at University College, London, 1893–1935.

Phidias, the greatest of Greek sculptors, flourished from about 500 to 432 B.C., was specially famous for his work in gold, ivory and bronze. Nothing now remains to attest his genius although the sculptures in the British Museum, widely known as the Elgin Marbles, may have been from his designs.

Philip II. of France (1180–1223), was a prominent figure in the third Crusade, in which for a time he associated himself with our Richard I. Victor over a strong coalition at the momentous battle of Bouvines in 1214.

Philip II. of Macedonia (382–336 B.C.), trained in military arts in Greece, when he came to the throne instilled martial ideas into his subjects, and entered upon a career of conquest that did not end until he had become master of Greece. Father of Alexander the Great.

Philip II. of Spain (1527–98), succeeded his father the Emperor Charles V. in half his dominions. The Revolt of the Netherlands, the annexation of Portugal in 1580, and the unsuccessful attempt to subdue England by the Armada, were outstanding events of his troubled reign. He was a devout Roman Catholic, strongly supported the Counter-Reformation, built the strange Escorial, and was four times married, his second wife being Mary Tudor.

Philip V. of Spain (1683–1746), founded the Bourbon dynasty in Spain, and was the son of the Dauphin of Louis XIV. and Maria Theresa of Spain. His uncle, Charles II. of Spain, bequeathed the kingdom to him, and this led to the war of the Spanish Succession, which ultimately confirmed him in his kingship.

Phillip, Arthur (1738–1814), first governor of New South Wales. Under his command the first fleet of 717 convicts set sail from Britain to Australia, and with the founding of Sydney in 1788 colonisation of the whole country began.

Phillips, Stephen (1868–1915), dramatist and poet of distinction. Wrote popular verse dramas, including *Paolo and Francesca*, *Herod*, and *Ulysses*.

Piasts, first Polish dynasty in Poland until 14th century and until 17th century in Silesia.

Piazzi, Giuseppe (1746–1826), an Italian astronomer. He was the discoverer of the planet Ceres, the first known of the asteroids.

Picasso, Pablo Ruiz (b. 1881), Spanish painter who received his early training in Catalonia and settled in Paris in 1903. His influence over contemporary art is comparable with that exercised by Cézanne (*q.v.*) over the artists of his time. His work is to be found in public galleries and private collections all over the world and is represented by *Femme Nue dans un Fauteuil Rouge* in the Tate Gallery. His genius has also found scope in sculpture and etchings and he has designed décor costumes for the ballet.

Piccard, August (b. 1884), Swiss physicist, professor of physics at Brussels until the German invasion in 1940. Noted for his ascents into the stratosphere by a special balloon in 1931 and 1932 and for his more recent attempts to study deep-sea life.

Pickford, Mary (b. 1893), was the leading film actress of the silent days and affectionately known as "the world's sweetheart."

Pilsudski, Marshal Joseph Clemens (1867–1935), wielded despotic power as the virtual Dictator of Poland for most of the time from 1920 until his death.

Pindar (522–443 B.C.), the eminent lyric poet of ancient Greece.

Pinero, Sir Arthur Wing (1855–1934), was an able English dramatist and former actor, of Portuguese descent. *Dandy Dick*, *The Second Mrs. Tanqueray* and *Mid-Channel* are among his plays.

Pirandello, Luigi (1867–1936), was a prominent Italian dramatist and novelist, many of whose works have been translated into English. Awarded Nobel Prize for Literature, 1934.

Pissarro, Camille (1830–1903), French Impressionist painter of landscapes; studied under Corot.

Pitman, Sir Isaac (1813–97), founded the Pitman system of phonographic shorthand.

Pitt, William (1759–1806), was the second son of the Earl of Chatham. Entered Parliament at twenty-one, and by his brilliant oratory captivated the House of Commons. In 1782, when only twenty-three, he became Chancellor of the Exchequer, and in the following year was made Premier, and held that office for seventeen years, through the trying period of the French Revolution, when war with France was almost continuous. He was undoubtedly one of the most brilliant statesmen that England has produced, and his death at the early age of forty-six was a great loss to the country. He was buried in Westminster Abbey.

Pius XII. (1876–1958), elected Pope March 2, 1939, a brilliant diplomat, scholar, and linguist. As Cardinal Eugenio Pacelli, he was Papal Secretary of State, 1930–39, and was outspoken in his condemnation of those aspects of the policy of the totalitarian states which he considered anti-Christian. Before he became a Cardinal he was for many years Papal Nuncio in Germany. His Pontificate was marked by the ordeal of world conflict, the rise of Communism in many parts of the world, and the international tension of the cold war.

Pizarro, Francisco (c. 1471–1541), was an adventurous Spaniard who, after Columbus's discoveries in the New World, set out for South America, conquering Peru for the Emperor Charles V. Pizarro's career in Peru was characterised by excessive cruelty, and in the end he was killed by his own soldiers.

Planck, Prof. Dr. Max (1858–1947), German physicist, whose investigations into radiation of energy culminated in 1901 in his law of radiation, which laid the foundation of the quantum theory. Awarded Nobel Prize for Physics, 1918.

Plato (427–347 B.C.), great Athenian philosopher, pupil of Socrates, teacher of Aristotle. He founded a school at Athens under the name of the Academy, where he taught philosophy and mathematics. His great work is his *Dialogues*, which includes the *Republic*, the longest and most celebrated of them all. All Plato's known writings have come down to us, and they constitute one of the most influential bodies of work in history.

Plimsoll, Samuel (1824–98), was a native of Bristol, and while M.P. for Derby got up an agitation on behalf of merchant sailors, procuring the passing of the Merchant Shipping Act of 1876, which by defining a line above which no ship must sink in the water when loaded has ever since made the overloading of ships illegal. The line is known as the Plimsoll Mark.

Pliny: Pliny the elder was a naturalist of high reputation; Pliny the younger, his nephew, achieved renown by a series of historical *Letters* and died A.D. 113.

Plotinus (c. 203–c. 262), Greek philosopher, was the founder of Neoplatonism, which had considerable influence on early Christian thought.

Plutarch (c. 46–120), a pagan Hellenic writer, a contemporary of the authors of the two gospels according to St. Matthew and St. Luke. His *Lives of Agis and Cleomenes* form one of the world's most famous literary productions.

Poe, Edgar Allan (1809–49), was an American poet of unique genius, author of "The Raven," "The Bells," "Annabel Lee," and other poems of haunting melody and dainty fancy. Poe's *Tales of Mystery* are thrilling examples of their class.

Poincaré, Raymond Nicolas Landry (1860–1934), was President of France from 1913 to 1920 and won the confidence and admiration of the French people and their Allies by his services during the first world war. He was Prime Minister in 1912, 1922–24, and 1926–29.

Pollard, Professor Albert Frederick, F.B.A. (1869–1948), English historian and first director of the Institute of Historical Research. His books include *Factors in Modern History*, *The Evolution of Parliament*, and many authoritative works on the Tudor period, such as his *Henry VIII*, *Wolsey*, and *Somerset*.

Polo, Marco (1256–1323), the famous Venetian traveller and explorer, who made journeys through China, India, and other eastern countries, and published the record of his various wanderings, recounting the many wonders and marvels he had seen—a record which seemed for the most part beyond credence to his contemporaries, but now largely confirmed.

Pompadour, Jeanne Antoine Poisson, Marquise de, otherwise known as Madame de Pompadour (1721–64), was for a long time the favourite of Louis XV. of France, over whom she exercised great influence.

Pompey the Great (106–48 B.C.), distinguished himself as a general while young, clearing the Mediterranean of pirates, and ultimately became, with Caesar and Crassus, triumvir.

Pope, Alexander (1688–1744), the celebrated 18th century poet and translator of *Homer*. Author of *The Rape of the Lock*, *Essay on Criticism*, and *Essay on Man*.

Portal of Hungerford, Marshal of the R.A.F. Charles Frederick Algernon, 1st Viscount, K.G., G.C.B., O.M., D.S.O. (b. 1893), Chief of the Air Staff, 1940–45.

Pound, Ezra Loomis (b. 1885). American poet and scholar, famous both for the beauty of his individual verse and for his excellent translations of Provencal, Latin, Chinese, French and Italian poets. Treason charges brought in 1945 against the poet were quashed in 1958 when he was released from the Federal mental hospital where he had been kept. He returned to Italy to live.

Poussin, Nicolas (1593–1665), an eminent French painter patronised by Louis XIII.

Prasad, Dr. Rajendra (b. 1884), first President of the Indian Union, 1950; re-elected for 5 years, 1952; re-elected at the 1957 General Election.

Praxiteles, a great Greek sculptor who lived in the 4th century B.C.

Preece, Sir William Henry, K.C.B., F.R.S. (1834–1913), a Welsh electrician, connected with the Electric Telegraph Service from 1853, and conspicuously successful in his experiments which led to the later developments in telegraphy. He was associated with Marconi in his wireless telegraphic schemes and introduced the block system into England.

Prescott, William Hickling (1796–1859), one of the best known of American historians.

Prichard, James Cowles, M.D., F.R.S. (1786–1848), British ethnologist and physician, whose knowledge of anatomy, psychology, and of languages enabled him to grasp the principle that people should be studied as a whole. He paved the way for future anthropological research.

Priestley, John Boynton, M.A. (b. 1894), novelist, playwright and broadcaster, whose work has received great praise and includes the novels *The Good Companions*, *Angel Pavement*, the plays *Dangerous Corner*, *Time and the Conways*, *The Linden Tree*, and a literary history, *Literature and Western Man* (1960).

Priestley, Joseph, F.R.S. (1733–1804), was the discoverer of oxygen and other gases, and wrote *A History of Electricity*. He was also a great advocate of freedom and progress.

Priestley, Sir Raymond, M.A., D.Sc. (b. 1886), geologist. Took part in the Shackleton Antarctic Expedition of 1907–9 and Scott's Antarctic Expedition 1910–13. President of the British Association, 1956.

Prior, Matthew (1664–1721), a well-known poet and wit who acquired celebrity by writing *The City Mouse and Country Mouse*.

Prokofiev, Serge Sergeyevich (1891–1953), celebrated Russian composer, whose music has a strong folk-song element, rich in melody and invention. He has written operas: *The Love of Three Oranges*, *The Betrothal in a Nunnery*, *War and Peace*, ballets: *Romeo and Juliet*, *Cinderella*, symphonies, chamber music and the music for Eisenstein's films *Alexander Nevsky*, *Ivan the Terrible*, etc.

Protagoras (c. 480–411 B.C.), a Greek philosopher, chief of the Sophists, famous for his scepticism and disbelief in objective truth.

Proudhon, Pierre Joseph (1809–65), a French political economist.

Proust, Marcel (1871–1922), French psychological novelist; author of a series of 15 novels known under the title of *A la Recherche du Temps Perdu*. Proust's works have been admirably translated into English by C. K. Scott Moncrieff.

Prudhon, Pierre Paul (1758–1823), a French historical and portrait painter.

Ptolemy, Claudius Ptolemæus, a famous astro-

nomer and geographer of Alexandria, who flourished from *c.* A.D. 90–168. He founded the Ptolemaic system, which taught that the earth was stationary and the heavenly bodies revolved around it.

Puccini, Giacomo (1858–1924), Italian composer whose operas met with great success and include *Manon Lescaut*, *La Bohème*, *La Tosca*, *Madam Butterfly*, and *Turandot* (finished after his death).

Purcell, Henry (1658–95), one of the great figures in English music; organist of the Chapel Royal and composer to Charles II. Anthems form the greater part of his sacred music, and he wrote not only for the Court but for the stage.

Pusey, Edward Bouverie (1800–82), a famous Anglican cleric; he published *Tracts for the Times*, which inaugurated the Tractarian movement that developed into what became known as Puseyism.

Pushkin, Alexander (1799–1837), the national poet of Russia, several times exiled for his liberal views and held in high honour by contemporary Russia. Died of wounds received in a duel. His poetical tales are full of dramatic power. *Eugene Onegin* is generally considered his masterpiece and *Boris Godunov* is a fine tragedy.

Pym, John (1584–1643), a prominent statesman in the reign of Charles I. A leader of the Puritan opposition in Parliament.

Pythagoras (*c.* 582–*c.* 507 B.C.), most influential of the early Greek scientists. He was born on the island of Samos, off the Turkish mainland, which he left *c.* 530 to settle at Croton, a Greek city in southern Italy. He was a mystic and mathematician and believed in the transmigration of souls. He died in exile. His great works are the *Almagest* and his *Geographical Outline*.

Q

Quaritch, Bernard (1819–99), a famous dealer in rare books, who was a native of Germany but settled in London, and became naturalised in 1847. His knowledge of scarce and valuable books was unique. His shop in Piccadilly was a storehouse of literary treasures.

Quasimodo, Salvatore (b. 1901), Italian poet whose greatness lies in his humanity and his rejection of the Fascist influence. He won the Nobel Prize for Literature in 1959.

Quiller-Couch, Sir Arthur Thomas (1863–1944), was a well-known novelist and essayist, who as "Q" published many delightful stories, including *Dead Man's Rock*, *Troy Town*, and *The Splendid Spur*. Edited the *Oxford Book of English Verse*. Professor of English Literature, Cambridge University, 1912–44.

R

Rabelais, François (*c.* 1495–1553), the great French satirist, first adopted the career of a monk, then studied medicine, and settled at Lyons as a doctor, and it was there that he published his *Gargantua and Pantagruel*, among the wittiest though coarsest books in any language.

Rachel, Mlle (stage name of **Elizabeth Félix**) (1821–58), acknowledged as the greatest tragic actress of her time and reached the height of her fame in Racine's *Phèdre* in 1843.

Rachmaninov, Sergei Vasilyevich (1873–1943), Russian pianist, composer, and conductor. He wrote operas, symphonies, piano concertos, piano pieces, and songs, and was one of the greatest pianists of his age. After the Russian revolution he made his home in America, where he died.

Racine, Jean (1639–99), a distinguished French tragic dramatist, best known by his *Andromaque*, *Phèdre*, and *Athalie*.

Rackham, Arthur, R. W. S. (1867–1939), a noted English artist who excelled in the illustration of books such as *Peter Pan*, *Alice in Wonderland*, Wagner's *Ring Librettos*, *Mother Goose*, Grimm's and Andersen's *Fairy Tales*.

Radhakrishnan, Sir Sarvepalli, Kt., M.A. (b. 1888). Vice-President of the Indian Union, 1952; formerly Spalding Professor of Eastern Religions and Ethics at Oxford.

Raeburn, Sir Henry, R.A. (1756–1823), was a famous Scottish portrait painter, and friend and pupil of Sir Joshua Reynolds.

Raemakers, Louis (1869–1957), Dutch cartoonist, famous for his scathing satires on the Germans during the first world war. His *Cartoon History of the War* was published in 1919.

Raffles, Sir Thomas Stamford (1781–1826), an eminent naturalist. He was the founder and first President of the Zoological Society of London. Founded Singapore, 1819.

Raikes, Robert (1735–1811), a practical propounder of the Sunday School system.

Raleigh, Sir Walter (1552–1618), a scholar, courtier, soldier, sailor, and statesman. In 1584 Queen Elizabeth granted him a patent for the discovery and settlement of unknown countries in the far West. The colonisation of Virginia followed. At one time he was in great favour at Court, but quarrelled with the Queen, and suffered in fortune in consequence. When James I. came to the throne, Raleigh was supposed to be implicated in a conspiracy against that monarch, and was sentenced to death. After that he was a prisoner in the Tower of London for twelve years, and there he wrote his *History of the World*, and other works. In 1615 James set him at liberty in order to head an expedition to Guiana in the hope of finding gold, but being unsuccessful he was again imprisoned on his return, and finally beheaded in Old Palace Yard.

Raleigh, Sir Walter, M.A. (1861–1922), Professor of English Literature at Oxford, and author of many volumes on eminent men of letters, including books on Milton, Wordsworth, and others. His work on Shakespeare, 1907, is his highest achievement.

Raman, Sir (Chandrasekhara) Venkata, F.R.S. (b. 1888), Indian physicist whose main work has been in spectroscopy. For his research on the diffusion of light and for the discovery of the "Raman Effect" he was awarded the 1930 Nobel Prize in Physics.

Rameau, Jean Philippe (1683–1764), French composer and church organist whose *Treatise on Harmony*, 1722, and other works on musical theory profoundly influenced musical development in the 18th century.

Ramón y Cajal, Santiago (1852–1934), Spanish histologist who made many discoveries in the structure of the nervous system. Nobel Prizeman, 1906.

Ramsay, Sir William, K.C.B., F.R.S. (1852–1916), chemist and discoverer with Lord Rayleigh of the hitherto unknown constituent of air, argon. Later discovered helium and detected other inert gases, which he called neon, krypton, and xenon. With F. Soddy carried out research on radium emanation. Awarded Nobel Prize in Chemistry, 1904. President of the British Association, 1911.

Rank, 1st Baron, Joseph Arthur (b. 1888), film magnate, who turned his attention from the family flour-milling business to the cinema and has built up a large and powerful organisation.

Ranke, Leopold von (1795–1886), the painstaking and thorough German historian who laid the basis of modern historical research and demonstrated many of its methods.

Raphael Santi (1483–1520), the distinguished Italian painter whose works excel all others in their beauty of expression and inspired treatment. He lived a considerable period in Rome, where he painted his famous frescoes for the Vatican and St. Peter's and also the celebrated cartoons designed for the tapestries of the Papal chapel, which afterwards were brought to England, and are now at the Victoria and Albert Museum. His last painting was *The Transfiguration*. Examples of his work are to be found in most of the great European collections, including our own National Gallery.

Rasputin, Grigori Yefimovich (1871–1916), Russian monk who lived quietly in his native village until 1904, when he became notorious for his extravagant teachings, which gave him a Messianic-like position, and advocated sin in order to obtain repentance and salvation. In 1907 he was presented to the Court where he soon became all-powerful. A seeming miracle which improved the health of the Tsarevitch Alexis increased his influence with the Czar and

Czarina, although he was hated by the bulk of the nation, and most of the nobility.

Rathbone, Eleanor (1872–1946), social reformer humanitarian, and independent politician. Championed widows' pensions and family allowances and laboured for political refugees, particularly children.

Ravel, Maurice (1875–1937), French composer, pupil of Fauré, one of the leaders of the impressionist movement. He wrote chiefly chamber music, piano pieces, songs, and ballet music, including *Daphnis et Chloé*, specially commissioned by Diaghilev.

Raven-Hill, Leonard (1867–1942), English artist and cartoonist, was well known for his drawings and cartoons in *Punch*, 1896–1935.

Rawlinson, Sir Henry Creswicke, Bt., G.C.B., F.R.S. (1810–95), diplomat, soldier and orientalist. For a number of years he superintended explorations in Assyria and Babylon, accumulating a valuable collection of antiquities now in the British Museum.

Ray, John (1627–1705), an English naturalist, famous for his contributions to the science of botany. He has been called the "father" of English natural history.

Rayleigh, 3rd Baron, O.M., F.R.S. (1842–1919), one of the most eminent of British physicists; an authority on sound vibrations, and the co-discoverer with Sir William Ramsay of argon. In 1904 was awarded the Nobel Prize for physics.

Read, Sir Herbert, Kt., D.S.O., M.C. (b. 1893), English poet and critic. He was assistant keeper at the Victoria and Albert Museum (1922–31), professor of fine art at Edinburgh (1931–33), and edited the Burlington Magazine (1933–39). His writings include *Poems 1914–1934*, *In Retreat*, *Reason and Romanticism*, *Education through Art*, *The Meaning of Art*.

Reade, Charles (1814–84), holds high rank amongst the Victorian novelists. His first story, *Peg Woffington*, was published in 1852. *It's Never too Late to Mend*, *Griffith Gaunt*, and *The Cloister and the Hearth* are his best-known novels.

Réamur, René Antoine Ferchault de (1683–1757), an eminent French chemist, who invented the thermometer which bears his name.

Récamier, Madame Jeanne Françoise Julie Adélaide Bernard (1777–1849), a noted society woman of the days of Napoleon.

Reeves, (John) Sims (1818–1900), was the most celebrated English tenor of his time.

Regnault, Henri Victor (1810–78), a French scientist who made highly successful experiments in regard to the physical properties of bodies and their relation to heat.

Regnault, Jean Baptiste, Baron (1754–1829), a talented French genre painter.

Reith, John Charles Walsham, 1st Baron (b. 1889), British civil engineer, the first Director-General of the British Broadcasting Corporation, 1927–38. Recognised as a man of great organising ability, he has served successively as Chairman of Imperial Airways (1938–39), Chairman of B.O.A.C. (1939–40), Min. of Information (Jan.–May 1940), Min. of Transport (May–Oct. 1940), Min. of Works and Buildings (Oct. 1940–Feb. 1942), Dir. of the Admiralty's Combined Operations Material Dept. (1943–45), Chairman Commonwealth Telecommunications Conference (1945), Chairman Commonwealth Communications Council (1946), and Chairman Colonial Development Corporation, 1950–59.

Rembrandt, Harmens van Rijn (1606–69), one of the greatest of the Dutch school of painters who produced many remarkably successful portraits, as well as numerous figure subjects, all of them distinguished by their masterly qualities. He was an etcher of high ability also, and a number of his works are in the British national collections.

Renan, Ernest (1823–92), a noted French author who wrote much upon religious subjects, and won special fame by his *Life of Jesus*, published 1863.

Reni, Guido. (*See* **Guido Reni.**)

Rennie, John, F.R.S. (1761–1821), a Scottish civil engineer. He was the constructor of the Waterloo and Southwark and new London bridges over the Thames, the London Docks, the East and West India Docks, the Plymouth breakwater, and many other works at Liverpool, Leith, Dublin, Hull, and elsewhere.

Renoir, Auguste (1841–1919), great French artist of the Impressionist school, whose vision was carefree and romantic. Some of his greatest achievements were in still-life and landscape. *La Loge*, *Les Parapluies*, *La Première Sortie*, *Grandes Baigneuses* are famous pictures.

Reuter, Baron Paul Julius de (1821–99), was the pioneer of telegraphic press services.

Reymont, Vladislav Stanislav (1868–1925), Polish novelist; Nobel Prize 1924 (*The Peasants*).

Reynolds, Sir Joshua, P.R.A. (1723–92), was the first President of the R.A. from 1768 till his death, and the most eminent English portrait painter of his time.

Rhodes, Rt. Hon. Cecil John (1853–1902), born at Bishop's Stortford. Went to South Africa in 1871, entered upon a diamond-mining enterprise at Kimberley, and acquired a considerable fortune. Was a member of the Cape Legislature in 1881, and became Premier in 1890. He was at the head of the British South Africa Chartered Company, for which a vast amount of territory was annexed, the holding obtaining the name of Rhodesia. Mr. Rhodes was Cape Premier again in 1896; then followed the Jameson Raid and his retirement from political life. During the Boer War he was detained in Kimberley and did not live to see the campaign closed. He left the bulk of his fortune for the founding of scholarships at Oxford.

Ricardo, David (1772–1823), a celebrated English political economist of Hebrew descent, whose *Principles of Political Economy* gained him a high place among the exponents of the science

Richard I. (1157–99) was King of England from 1189 to his death. He laid heavy burdens upon the people in order to equip an army for the third Crusade. At first he was victorious and did such valiant deeds that he received the name of "Cœur de Lion." Being ultimately defeated, he signed a truce with Saladin, and on his way back to England was shipwrecked. Disguised as a pilgrim, he was identified in Austria, and handed over to the Emperor of Germany, who imprisoned him in a remote castle. A large sum was demanded and paid for his ransom, and after over a year of durance he returned to England, and was crowned at Winchester. Later he was engaged in a war with France, and was mortally wounded by a bolt from a crossbow while besieging the castle of Chaluz in the province of Limousin.

Richard II. (1367–1400), son of the "Black Prince," succeeded his grandfather, Edward III., in 1377, when but ten years old, a Regency being appointed during his minority. In the Wat Tyler rising of 1381 the King confronted the rioters and promised them redress, an undertaking which he did not fulfil. For a time he was greatly under the influence of his uncle, Thomas, Duke of Gloucester, but on coming of age dismissed him, and ruled with some approach to dignity for the next seven years. After 1396 he developed a highly tyrannical disposition and banished or put to death many of the leading statesmen, practically freeing himself from Parliamentary control. The opposition against him came to a head in 1399, when Bolingbroke defeated him, and he was made prisoner and died—probably by violence—in Pontefract Castle.

Richard III. (1452–85) last Plantagenet king of England who usurped the throne on the death of his brother Edward IV. in 1483, murdering his two younger nephews in the Tower. This led to a rebellion in favour of the Earl of Richmond (later Henry VII.) and he was slain on Bosworth Field. His character has been the subject of dissension among historians but there is no doubt that despite his unscrupulousness he was a brave soldier and able administrator.

Richards, Sir Gordon (b. 1904), British jockey who had one of the most successful riding records in the history of the British Turf: 21,834 mounts, 4870 winners, including the Derby (1953). Retired, 1954.

Richardson, Sir Albert Edward, K.C.V.O., P.R.A., F.S.A., F.R.I.B.A. (b. 1890), British architect and Pres. of the Royal Academy, 1954–56.

Richardson, Henry Handel, pseudonym of Henrietta Richardson Robertson (1870–1946), Aus-

tralian novelist whose major work, outstanding in Australian fiction, is the trilogy *The Fortunes of Richard Mahony*.

Richardson, Sir Owen Williams, D.Sc., F.R.S. (1879–1959), distinguished English physicist. Awarded Nobel Prize in 1928 for his researches on the emission of electricity from hot bodies.

Richardson, Sir Ralph David (b. 1902), actor who has made many appearances on stage, screen, and radio. Among his films are *South Riding, Anna Karenina*, and *The Fallen Idol*.

Richardson, Samuel (1689–1761), author of *Pamela, Clarissa*, and *The History of Sir Charles Grandison*, exercised considerable influence on the development of the novel in England.

Richelieu, Armand Jean du Plessis, Cardinal Duc de (1585–1642), the eminent French ecclesiast and statesman, who was Minister to Louis XIII. for eighteen years. He was practically Master of France during the best part of this Cardinalate.

Ridley, Nicholas (1500–55), was Bishop of Rochester in 1547 and Bishop of London in 1550. He took an active part in the Reformation. He was burned at the stake along with Latimer.

Rienzi, Cola di (1313–54), a Roman patriot of humble birth who inflamed the people against their rulers, and aroused such enthusiasm that they proclaimed him "Tribune." During the seven months that he was permitted to exercise supreme power, he proved himself the true friend of the poor. Ultimately, however, his enemies proved too strong for him and he was imprisoned for three years at Avignon. Later murdered in a popular uprising.

Rilke, Rainer Maria (1872–1926), German lyric poet, born in Prague. His work, marked by great beauty of style, culminated in the *Duineser Elegien* and *Sonette an Orpheus*, both published in 1923.

Rimbaud, Jean Nicolas Arthur (1854–91), French poet of great originality and friend of Paul Verlaine. All his poems were written between his sixteenth and nineteenth years.

Rimsky-Korsakov, Nikolai Andreyevich (1844–1908), Russian composer whose works include the operas *The Maid of Pskov* (also known as *Ivan the Terrible*), *The Snow Maiden, Le Coq d'Or*, and the symphonic suite *Scheherezade*. He was a brilliant orchestrator and rescored many works, including Borodin's *Prince Igor*.

Rizzio, David (*c.* 1540–66), was the Italian secretary of Mary Queen of Scots and an accomplished musician. Suspected of a too great attachment to Mary, he was murdered by Darnley and his friends in the Queen's presence in the Palace of Holyrood.

Robbia, Luca Della (1400–1482), a famous Florentine sculptor. He was the introducer of enamelled terra-cotta work.

Roberts, Field-Marshal Earl, V.C., K.G., P.C., K.P., G.C.B., O.M., G.C.S.I., G.C.I.E. (1832–1914), the distinguished soldier, first saw service in the Indian Mutiny, when he won the V.C. In 1880 during the Afghanistan campaign made his historic march from Kabul to Kandahar where he won a complete victory. After serving as C.-in-C., India, 1885–93, and as C.-in-C., Ireland, 1895–99, took over in South Africa in December, 1899, and entirely reversed the unhappy military situation before handing over to Kitchener a year later. C.-in-C. from 1901 until the office was abolished in 1904, and was latterly an ardent advocate of conscription.

Robertson, Sir Charles Grant, C.V.O. (1869–1948), English historian who was Vice-Chancellor of Birmingham University, 1927–38, and Principal 1920–38. His works include *The Rise of the English Nation*, 1895, *England under the Hanoverians*, 1911, and *Bismarck*, 1918.

Robertson, Field-Marshal Sir William, Bt., G.C.B., G.C.M.G., G.C.V.O., D.S.O. (1860–1933), the only British soldier to rise from Private to Field-Marshal, served as C.I.G.S., 1915–18. His son, **General Sir Brian Hubert,** G.C.B. (b. 1892), has had a distinguished military career and was appointed Chairman of the British Transport Commission in 1953.

Robeson, Paul Le Roy (b. 1898), the famous Negro singer and actor, who through his singing of spirituals has increased our knowledge and understanding of the Negro. Was a great success in London in 1930 playing *Othello*.

Robespierre, Maximilien François Marie Isidoire de (1758–94), was a country advocate until the outbreak of the French Revolution, when he went to Paris, became an enthusiastic leader of the Jacobin Party, and was made a Member of the Assembly. In the Reign of Terror as President of the Committee of Public Safety he sent vast numbers to the guillotine. Then a counter-movement was set on foot and he was denounced in the Assembly, and, trying to escape, was shot and subsequently guillotined.

Robey, Sir George, C.B.E. (**George Edward Wade**), (1869–1954), famous British comedian of the music-hall.

Robinson, William Heath (1872–1944), English book illustrator, but especially known for the fantastically comic designs of his cartoons and stage scenery.

Rob Roy (the traditional nickname of **Robert McGregor**) (1671–1734), a noted Highland outlaw who levied blackmail on the farmers and rich people of the country-side in return for certain protective services. He belonged to the clan McGregor.

Robsart, Amy (1532–1560), daughter of Sir John Robsart, and wife of Robert Dudley, afterwards Earl of Leicester. While living in seclusion at Cumnor Place under the charge of Anthony Forster, she met her death either by accident or foul play, by the latter according to common belief, Elizabeth's favourite having reason to wish her out of the way. She was discovered dead at the bottom of an old staircase.

Rockefeller, John Davison (1839–1937) was said to be the richest man in the world. Was born on a small farm in New York State, and there worked until sixteen. Migrated to Cleveland, and found employment in an office for a few years. About this time the oil trade was in a disorganised condition, owing to the reckless trading and crude methods of refining. Rockefeller saw what was wrong, and resolved upon trying to remedy it. Later he began oil-refining, and entered into the business with such vigour of purpose, and made so many improvements, that he became a millionaire in a very few years. From the exertions of himself and associates grew the Standard Oil Trust, beginning with a capital of £200,000 in 1870, and extending at such a rate that in 1892 the capital had reached twenty-two millions sterling. During his life-time he gave some 750 million dollars to education and charity.

Rodin, Auguste (1841–1917), the most celebrated French sculptor of recent days, who possessed a bold and original genius. His numerous statues and his fine historic monuments, especially that for Calais commemorating the bravery of Eustache de Saint-Pierre, brought Rodin well-deserved fame.

Rodney, 1st Baron, K.B. (1719–92), a famous English admiral who, having gained numerous victories, routed the French fleet under the Comte de Grasse, whom he took prisoner, the result of this crowning success being the Peace of Versailles, 1783.

Rogers, William Penn Adair (**"Will"**) (1879–1935) was America's foremost humorist and a famous stage and film star; was killed with Wiley Post on a holiday flight to Alaska Aug. 15, 1935.

Roland de la Platière, Madame Manou Jeanne (1754–93), was one of the leading figures of the French Revolution. Her husband, **Jean Marie Roland de la Platière** (1734–93), who was one of the Ministers during the Girondist period, escaped from Paris on the disruption of his Party, but his wife remained behind, and was sent to the guillotine. During her incarceration she wrote an *Appeal to Posterity*, remarkable for its beauty of sentiment and patriotic enthusiasm. Her husband committed suicide on receiving the news of her execution.

Rolland, Romain (1866–1944), an eminent French author whose finest work, *Jean-Christophe*, in ten vols., gained him the Nobel Prize for Literature, 1915.

Romilly, Sir Samuel, K.C. (1757–1818), a famous English lawyer who was Solicitor-General in 1806 and for many years had a distinguished career both in Parliament and at the Bar. He effected many improvements in the Criminal Law.

Rommel, Field-Marshal Erwin (1891–1944), was probably the ablest German general engaged in

the second world war. His conduct of the war during the North African campaign won high praise and brought the redoubtable Afrika Corps nearly to Alexandria. He was also engaged in the campaigns in Western Europe in 1940 and 1944.

Romney, George (1734–1802), was born in North Lancashire, studied portrait painting with a Kendal artist, and for a few years obtained a living by local portrait painting. Going to London in 1762, his talent gained him speedy recognition; and after studying for a couple of years in Rome, he set up as a portrait-painter in Cavendish Square, and became highly successful. His portraits are among the finest examples of that kind of art that England has produced, and to-day realise large prices.

Röntgen, Professor Wilhelm Konrad (1845–1923), the eminent German scientist who discovered the Röntgen rays in 1895. He made other important laboratory investigations, resulting in the solution of difficult chemical problems.

Roosevelt, President Franklin Delano (1882–1945), great American statesman. Was Assistant Secretary to the Navy under Wilson and unsuccessful Democratic candidate for the vice-presidency in 1920. In 1921 was stricken with infantile paralysis, but recovered sufficiently to re-enter public life and become Governor of New York in 1929. From 1933 until his death served as President of the U.S.A., being the first American to be elected for more than two terms. His New Deal programme (see Gen. Information Section) was outstanding in his domestic policy. His "good neighbor" attitude towards the other American countries, his hamstrung efforts to restrain Axis aggression in the 1930s, his inspired and generous adoption of Lend-Lease, his war-time meetings with Churchill and Stalin, and his energetic prosecution of the war after Pearl Harbour, were the more important features of his foreign policy. His "fireside" talks on the radio brought him into close contact with the American people and his passing in the hour of victory was mourned all over the world. In 1905 married his distant cousin, **Eleanor Roosevelt** (b. 1884), who has become known on her own account as a sociologist and newspaper columnist. She became Chairman of the U.N. Human Rights Commission in 1947.

Roosevelt, Theodore (1858–1919), Republican President of the U.S.A., 1901–2, and unsuccessful third party candidate in 1912 following a dispute with Taft. His daring exploits in the Spanish-American war won him wide popularity and he was elected vice-president in 1900 becoming president on McKinley's assassination. For his efforts in promoting peace, notably between Russia and Japan, was awarded the Nobel Prize in 1906. The great struggle with the Trusts marked his years of office.

Rops, Félicien (1833–98), Belgian artist, famous for drawings, etchings, and illustrations. His work is highly original, spirited, humorous and a valued commentary on the life at the time. Was an engraver of magnificent technical skill and a painter of merit.

Ross, Sir James Clark, F.R.S. (1800–62), most experienced polar explorer of the century. He accompanied his uncle, Sir John Ross, and Captain Parry on their expeditions. In the *Victory* commanded by his uncle he located the north magnetic pole in 1831. He commanded the expedition of the *Erebus* and the *Terror* to the antarctic (1839–43), discovering Victoria Land, Mounts Erebus and Terror, and the Ross ice barrier.

Ross, Rear Admiral Sir John, K.C.B. (1777–1856), the eminent explorer who made several voyages to the arctic and searched for the North-west Passage. He discovered Boothnia peninsula, and his nephew reached the magnetic pole.

Ross, Colonel Sir Ronald, K.C.B., K.C.M.G., F.R.S. (1857–1932), professor of tropical sanitation and a leading authority on tropical diseases generally, was for many years in the Indian Medical Service, and was awarded the Nobel Prize for Medicine in 1902. Discovered the malaria parasite.

Rossetti, Dante Gabriel (1828–82), was the son of Gabriele Rossetti (1783–1852), an exiled Italian author who settled in London in 1824. Dante showed great talent as a painter from boyhood, and became one of the Pre-Raphaelite Brotherhood, formed in 1848. He also distinguished himself as a poet. His sister, **Christina Georgina Rossetti** (1830–94) was also noted as a poet.

Rossini Gioacchino Antonio (1792–1868), Italian operatic composer. His first opera *Tancredi* was produced at Venice when he was 21, and between 1816 and 1823 he wrote 21 operas, including *Il Barbiere di Seviglia*, *La Cenerentola*, *Otello*, *La Donna del Lago*, and *Semiramide*. After writing *Guillaume Tell* in 1829, which was hailed as his masterpiece, he gave up composing, producing only a *Stabat Mater* (1832–41) and a mass (1864).

Rostand, Edmond Eugene Alexis (1868–1918), dramatist and member of the French Academy, whose *Cyrano de Bergerac* created a sensation in 1898.

Rothenstein, Sir William (1872–1945), English painter and writer. Prof. of Civic Art in Sheffield University, 1917–26; Principal of Royal College of Art, 1920–35; Trustee, Tate Gallery, 1927–33. His paintings include *Doll's House*, *Aliens at Prayers*, *Jews Mourning in a Synagogue*. His son, **Sir John Rothenstein,** C.B.E. (b. 1901), is Director and Keeper of the Tate Gallery.

Rothschild, Anselm Meyer (1743–1812), the founder of the famous financial family was born at Frankfurt-on-Main. After some experience in a bank as clerk, set up for himself first as a moneylender, then as a banker and displaying a genius for finance acquired a large fortune. His son, **Nathan Meyer Rothschild** (1777–1836), took charge of the London house, and conducted its affairs with great success, and was made an Austrian Baron in 1822. He was succeeded by his eldest son, **Baron Lionel de Rothschild** (1808–1879), who was the first Jewish member of the House of Commons.

Roubillac, Louis François (1695–1762), a French sculptor who contributed many monuments to Westminster Abbey.

Rouget de Lisle, Claude Joseph (1760–1836), a French poet who was the author of the words and the music of the *Marseillaise*, the revolutionary song and national anthem of France.

Rousseau, Jean-Jacques (1712–78), French philosopher, political writer, and composer. He was born at Geneva, and after a hard and wandering life made the acquaintance of Madame de Warens, who became his patroness and with whom he resided during the years 1731–41. He then proceeded to Paris, where he made the acquaintance of Diderot, to whose *Encyclopédie* he contributed the musical section. With the production of his pastoral melodrama *Le Devin du village* in 1722 he appeared as a successful composer. Meanwhile he had been studying social questions with great ardour, and in 1761 published his novel *Julie, ou la Nouvelle Héloïse*, which was followed in 1762 by *Emile*, a treatise on education in novel form. These two works contained so much that was at variance with convention, and so opposed to all ideas of moral restraint, that they called forth the condemnation of the orthodox, and Rousseau was obliged to leave France for a time. It was while in England that he wrote his remarkable *Confessions* and his celebrated *Le Contrat Social*. He gave to France a new field of thought, and laid down principles of government and conduct which bore fruit in the French Revolution.

Royden, (Agnes) Maude, C.H. (Mrs. Shaw) (1876–1957), noted woman preacher, Assistant preacher at the City Temple, 1917–20.

Rubens, Sir Peter Paul (1577–1640), one of the most notable of Flemish painters. In 1629 he painted for Charles I., who knighted him. His *Adoration of the Magi* was sold in 1959 for the record price of £275,000.

Rubinstein, Anton Grigorovich (1829–94), a famous Russian pianist and composer and founder of the Conservatory St. Petersburg (now Leningrad). His brother Nicholas (1835–81), also a pianist, founded the Conservatory of Moscow.

Rupert, Prince (1619–82), the brilliant Royalist cavalry general and an admiral opposing Cromwell and later the Dutch, was also an early mezzotinter, an experimental scientist, and the first governor of Hudson's Bay Company.

Ruskin, John (1819–1900), writer and art critic, the son of a wealthy London wine merchant

His *Modern Painters* exhibited a masterly perception of the principles of art and a boundless gift of literary expression. Other volumes appeared at intervals including *The Seven Lamps of Architecture* and *The Stones of Venice*, two memorable works which considerably enhanced the author's fame. His writings undoubtedly hastened the recognition of Turner and the Pre-Raphaelite painters. Always taking a deep interest in economic questions, Ruskin delivered and published numerous lectures on a wide range of subjects—art, pleasure, religion, war, work, and so forth; and he was acknowledged to be one of the greatest thinkers of the time. Often his views were impracticable and even eccentric, but behind them there was always evident a sincere desire to promote the well-being of the people.

Russell, Bertrand (Arthur William) 3rd Earl, O.M., F.R.S., M.A. (b. 1872), great English philosopher and mathematician, whose vigorous and sceptical writings are having a profound effect on present-day thought. He writes and speaks in a clear and elegant style and regards the task of the philosopher as one of clarification rather than of speculation. In recent years Lord Russell has been actively engaged in the campaign against nuclear warfare. His numerous writings include *The Principles of Mathematics* (1903), *Principia Mathematica* (1910), written in collaboration with A. N. Whitehead, *Problems of Philosophy* (1911), *Marriage and Morals* (1929) *History of Western Philosophy* (1945), *Human Knowledge* (1948), *Commonsense and Nuclear Warfare* (1959). Nobel Prize for Literature, 1950.

Russell, Sir (Edward) John, O.B.E., D.Sc., F.R.S. (b. 1872). A leading expert on soil chemistry, he has visited most countries of the Commonwealth, the U.S.A., U.S.S.R., and many European countries lecturing and advising on agricultural problems. President of the British Association, 1949.

Russell, George William (1867–1935), Irish poet generally known by his pen name of A.E. or Æ. Widely known as a leader in co-operative enterprise and a pioneer of Abbey Theatre, Dublin.

Russell, John, 1st Earl, K.G., P.C. (1792–1878), third son of the 6th Duke of Bedford. Entered Parliament as Lord John Russell on attaining his majority, and, ranging himself on the Liberal side, showed great capacity for affairs. Introduced first great measure of Reform, which was passed in 1832. Held several offices before succeeding Peel as Prime Minister in 1846. Remained in power until 1852, and was again Prime Minister from 1865 to 1866, resigning when he failed to carry a further reform bill. He also wrote lives of Thomas Moore and Charles James Fox.

Russell of Kilowen, Baron, P.C., G.C.M.G. (1832–1900), Lord Justice of England 1894–98. Was one of the greatest British judges and advocates of the 19th century.

Rutherford, Lord, O.M., F.R.S. (1871–1937), of New Zealand birth. Physicist, pre-eminent in the field of atomic research. Conducted his experiments at Montreal, Manchester, and at the famous Cavendish Laboratory at Cambridge, which attracted brilliant young scientists from all over the world. In 1911 announced his nuclear theory of the atom, and in 1918 succeeded in splitting the atom for the first time. His work paved the way for future nuclear research.

Ruysdael, Jacob van (*c.* 1628–82), great Dutch landscape painter, some of whose pictures are in the National Gallery.

Ruyter, Admiral Michiel Adriaanzoon de (1607–76), the Dutch admiral who in 1667 invaded England with a fleet of Dutch war vessels, advancing up the Thames and Medway and setting fire to considerable shipping. He soon saw fit to retreat, and more serious trouble was averted.

S

Sachs, Hans (1494–1576), the German shoemaker-poet of Reformation times, was an earnest worker in the Protestant cause, and wrote over 5,000 different pieces, poetry and prose.

Sadi, or Saadi (Muslih-Uddin) (*c.* 1184–1292), the Persian poet who flourished in the 13th century, and won national fame by his poems *The Garden of Roses* and *The Orchard*.

Sainte-Beuve, Charles Augustin (1804–69), French critic, and one of the most accomplished men of letters under the Second Empire. Author of *Causeries du lundi* and *Histoire de Port Royal*.

Saint-Just, Antoine (1767–94), one of the later leaders of the French Revolution closely associated with Robespierre.

St.-Laurent, Rt. Hon. Louis Stephen, Q.C. (b. 1882), Prime Minister of Canada, 1948–57.

Saint-Saëns, Charles Camille (1835–1921), French composer. He made his debut at a pianist at 10, studied at the Paris Conservatoire, and was for 20 years organist at the Madeleine. His compositions have a classical style and elegance and include symphonic and chamber music and the opera *Samson et Dalila*, which was produced by Liszt at Weimar in 1877.

Saint-Simon, Claude, Comte de (1760–1825), a French scientist and socialist who had great influence upon the thought of his time.

Saintsbury, George Edward Bateman (1845–1933). Professor of Rhetoric and English Literature, Edinburgh University, 1895–1915. Author of numerous critical works on literary subjects, on which he was a leading authority.

Saladin (1137–93), the great Sultan of Egypt and Syria who led the Moslems against the Christians in the Third Crusade. In 1187 he had driven the Christians from Jerusalem after a brilliant victory at Hattin near Tiberias. This gave rise to the Third Crusade led by the Emperor Frederick I., Philip II. of France, and Richard I. of England, which achieved little. Besides being a great warrior, Saladin was a wise and cultured man, renowned for his chivalry.

Salazar, Antonio d'Oliveira (b. 1889), Prime Minister and virtual dictator of Portugal since 1932 and responsible for drafting the Portuguese constitution of 1933. Foreign Minister, 1936–47.

Salisbury, Robert Arthur Talbot Gascoyne Cecil, 3rd Marquess of, K.G. (1830–1903), led the Conservative Governments of 1885–86, 1886–92, and 1895–1902. Has been considered one of the best Foreign Secretaries England has ever had, holding the office from 1878 to 1880, when he attended the Congress of Berlin, and for much of his premiership. Retired from political life after peace was declared in South Africa. His grandson, **Robert Arthur James Gascoyne-Cecil, 5th Marquess of Salisbury,** K.G. (b. 1893), was Leader of the House of Lords, 1942–45 and again 1951–57 when he resigned from the Government over its Cyprus policy. As Viscount Cranborne served as Sec. of State for the Dominions and for the Colonies.

Salter, James Arthur, 1st Baron, P.C., K.C.B., G.B.E. (b. 1881), British economist. Successively Min. of State for Econ. Affairs, 1951–52, and Min. of Materials, 1952–53. Assisted the Government in the direction of shipping in both world wars. Independent member for Oxford University, 1937–50.

Samuel, 1st Viscount, P.C., O.M., G.C.B., G.B.E. (b. 1870), High Commissioner for Palestine, 1920–22; Postmaster-General, 1910–14, and again May to Dec. 1915; Home Secretary, 1916, and again 1931–32. M.P. for Cleveland Division (N. Riding, Yorks), 1902–18, and Darwen Div. of Lancs., 1929–35. Was Under-Sec. to the Home Dept., 1905–9; Chancellor of the Duchy of Lancaster, 1909–10 and 1915–16. Leader of the Liberal Party in the Commons, 1931–35, and in the Lords, 1941–55.

Sand, George (1804–76) the leading French authoress of her time—proper name, Armandine Lucile Aurore Dupin, baronne Dudevant—who, both as novelist and dramatist, achieved the highest success. A friend of men of such singular power as Alfred de Musset, Chopin and Sandeau.

Sanger, Frederick, B.A., Ph.D., F.R.S. (b. 1918), British scientist; Prof. of Biochemistry, Cambridge. Awarded 1958 Nobel Prize for Chemistry for his work in determining the clinical structure of the protein insulin.

Sankey, Ira David (1840–1908), the celebrated American evangelist, singer, and composer, associated with Dwight L. Moody, the revivalist (1837–1899) in mission-work in America and Great Britain for many years.

Santayana, George (1863–1952), philosopher and poet, born in Madrid of Spanish parentage. He was Professor of Philosophy at Harvard University (where he graduated in 1886) from 1907–12, when he moved to France and thereafter spent his time wandering from country to country. His books include *The Life of Reason* (1905–6), the four volumes of *Realms of Being* (1923–40), *Persons and Places* (1945), and *The Middle Span* (1948).

Santos-Dumont, Alberto (1873–1932), Brazilian aeronaut, his most notable flights being made in Paris, and at Monte Carlo. He visited London in 1903.

Sappho (flourished 611–592 B.C.) was the famous lyric poetess of ancient Greece, whose romantic story of *Unrequited Love* is better known than her poetry, of which only a few samples survive.

Sardou, Victorien (1831–1908), French dramatist who had a long series of successes—*Nos Intimes, Séraphine, Rabagas, Divorçons, Fédora, Théodora, Patrie, La Tosca, Madame Sans-Gêne, Robespierre*, and *Dante*, the last-named written specially for Sir Henry Irving. He was elected to the French Academy in 1877.

Sargent, Sir Harold Malcolm Watts, A.R.C.O., F.R.C.M., F.R.S.A. (b. 1895), one of the best known modern British conductors. Succeeded Sir Adrian Boult as permanent conductor of the B.B.C. Symphony Orchestra, 1950–57.

Sargent, John Singer, R.A. (1856–1922). He was of American parentage and received his art education in Paris. As a portrait-painter he had few equals.

Sarolea, Charles, D.Ph., D.Litt., LL.D. (b. 1870), a great scholar and authority on literature. Belgian by birth, but now a naturalised Englishman.

Sartre, Jean-Paul (b. 1905), French philosopher, dramatist, and novelist. Founder of the French *Existentialist* school of philosophy. Imprisoned by the Germans, 1940–41, and joined Resistance Movement after his release. Author of the plays *Huis Clos, La Putain Respectueuse, Crime Passionnel.*

Sassoon, Siegfried (Lorraine), C.B.E. (b. 1886), English poet and writer who received the Hawthornden Prize, 1929, for *The Memoirs of a Fox-hunting Man.*

Savonarola, Girolamo (1452–98), Florentine preacher and reformer, a Dominican friar, who denounced vice and corruption not only in society but also in the Church itself, especially attacking Pope Alexander VI. He was excommunicated, imprisoned, and with two of his companions hanged in public. His passion for reform made him impatient of opposition and incapable of compromise. He understood men's hearts but not their limitations. Yet he was a noble figure rightly commanding the respect of later ages. George Eliot's historical romance *Romola* gives a fine portrait of Savonarola.

Sayce, Prof. Archibald Henry, D.Litt., LL.D., D.D. (1845–1933), a distinguished Assyriologist and philologist who was Prof. of Assyriology at Oxford University, 1891–1919. His most important works are *Introduction to the Science of Language*, 1879, *Ancient Empires of the East*, 1884, *The Principles of Comparative Philology*, 1874, and *Egypt and Babylonian Religion*, 1903.

Sayers, Dorothy Leigh (1893–1957), English authoress who became famous as a writer of detective fiction.

Scarlatti, Alessandro (1659–1725), Italian musician whose influence on the history of opera has been great, founded the Neapolitan school. He composed over 100 operas, 200 masses, and over 700 cantatas and oratorios. His son **Domenico** (1685–1757) was a harpsichord virtuoso and his work has had an important influence in the evolution of the sonata. The chief years of his life were spent at the Spanish Court in Madrid.

Schiaparelli, Giovanni Virginio (1835–1910), famous Italian astronomer who was Director of the Milan Observatory, 1862–1900, and did valuable work on meteors and double stars, but is best known for his discovery of so-called canals on Mars.

Schiller, Johan Christolph Friedrich (1759–1805), the famous German dramatist and poet. Was born at Marbach in Württemberg. Educated at the Military Academy at Stuttgart, and intended for a soldier, he evinced an irresistible desire for literary fame, and in 1782 had his first play, *The Robbers*, successfully produced at the Mannheim Theatre, to which he was subsequently appointed dramatic composer. Later he went to Dresden, where he completed his *Don Carlos*; from 1789 to 1793 he held the chair of history at Jena Univ. when he wrote his *History of the Thirty Years' War*, and gained the friendship of Goethe, at whose suggestion he removed to Weimar, and during the next ten years produced his greatest works—*Wallenstein, Mary Stuart, The Maid of Orleans*, and *William Tell*. A favourite among his many ballads is "The Song of the Bell."

Schlegel, August Wilhelm von (1767–1845), German poet and scholar, best known for his translations of Shakespeare (which established Shakespeare in Germany), Dante, Calderón, and Camões. His *Lectures on Dramatic Art and Literature* are outstanding for their scholarship.

Schliemann, Heinrich (1822–90), German archæologist who made many notable excavations, discovered Troy and other Homeric sites. (*See* **H3**).

Schnabel, Artur (1882–1951), American pianist of Austrian birth, regarded as the greatest exponent of Beethoven's pianoforte sonatas.

Schönberg, Arnold (1874–1951), Austrian composer who emigrated to the United States during the Nazi regime. Among his works are the choral orchestral *Gurre-Lieder* and *Pierrot Lunaire*, a cycle of 21 poems for voice and chamber music

Schopenhauer, Arthur (1788–1860), was a German philosopher of a pessimistic cast of mind. His mysticism partakes somewhat of the higher Buddhism. His chief works are *The World Considered as Will and Idea* and *The Two Fundamental Problems of Ethics.*

Schreiner, Olive, pen name of Mrs. Cronwright Schreiner (1855–1920), a noted South African novelist, born in Basutoland. She first attracted attention with her successful *Story of an African Farm* (1883) by which work she is best known. She excelled in depicting veldt scenery and Dutch character.

Schubert, Franz Peter (1797–1828), Austrian composer, born in Vienna, the son of a schoolmaster He was a contemporary of Beethoven and wrote not only symphonies, sonatas, string quartets, choral music, and Masses but also over 600 songs of unsurpassed lyrical beauty. It is as creator of the German *Lied* that his name is immortal. He died in Vienna at the age of 31, in poverty, before the full flowering of his musical genius.

Schumann, Robert Alexander (1810–56), composer of the early 19th-century German Romantic school. He wrote much chamber music, four symphonies, a piano concerto, and choral music, but it is his early piano pieces and songs that give constant delight. His wife **Clara** (1819–96) was one of the outstanding pianists of her time, especially as interpreter of Chopin.

Schweitzer, Albert, D.Theol., Dr. Phil., Dr. Med. (b. 1875), missionary in Lambaréné, a musical critic and authority on Bach's music, a famous organist, and a noted biblical critic who became a Doctor of Medicine in order to devote his life to missionary work in Equatorial Africa. Awarded 1952 Nobel Prize for Peace and Hon. O.M. in 1955.

Scipio, Publius Cornelius (*circa* 232–183 B.C.), the greatest of the Scipios known as Scipio Africanus the elder. A distinguished Roman general in the 2nd Punic War.

Scott, Charles Prestwich (1846–1931), English journalist who was editor of the *Manchester Guardian*, 1872–1929, which under his editorship became one of the leading journals of the country.

Scott, Sir George Gilbert, R.A. (1811–78), architect who gained special fame for his restorations of Gothic churches and cathedrals, incl. Westminster Abbey, designer of the Albert Memorial, St. Pancras Station, the Martyrs' Memorial at Oxford, and St. Anne's Church in Alderney.

Scott, Sir Giles Gilbert, O.M., R.A., F.R.I.B.A. (1880–1960), architect whose work includes the great modern Gothic Liverpool Cathedral (begun 1904 and still under construction) and Waterloo Bridge. Grandson of the above.

Scott, Peter Markham, M.B.E., D.S.C. (b. 1909), son of Captain Scott, is known as yachtsman, broadcaster, author of *The Battle of the Narrow Seas*, and bird-artist.

Scott, Captain Robert Falcon, C.V.O. (1868–1912),

commanded the National Antarctic Expeditions in 1901–4 and in 1910. His ship, the *Terra Nova*, left England on June 1, 1910. In Jan. 1911, winter quarters were established at Cape Evans, and in the following November Scott and a select party left Hut Point for the South Pole, which they reached on Jan. 18, 1912, finding there the Amundsen records. On the return journey every member of the party perished. Seaman Edgar Evans died from concussion of the brain on Feb. 17; Capt. Oates from exposure on March 17; and on March 29 the rest of the party (Scott, Wilson and Bowers) died from starvation and exposure in a blizzard when only 11 miles from One Ton Depot.

Scott, Sir Walter, Bart. (1771–1832), one of the greatest of British novelists and a distinguished poet. He was educated for the Bar. His *Minstrelsy of the Scottish Border* was published in 1802. This was followed in 1805 by *The Lay of the Last Minstrel*, in 1808 by *Marmion; The Lady of the Lake*, *Rokeby* and *The Lord of the Isles* coming afterwards in quick succession. In 1814 he published *Waverley* anonymously, which obtained instant success. Other stories followed and the Waverley novels and their author, "The great Unknown," were everywhere the subject of discussion. *Guy Mannering*, *The Antiquary*, *Old Mortality*, *Rob Roy*, and the *Heart of Midlothian* were all published before the secret of their authorship was disclosed. The chief works of his last years were *Woodstock*, *Life of Napoleon*, and *Tales of a Grandfather*. He died at Abbotsford. Created a baronet in 1820.

Scott-Paine, Hubert (1891–1954), pioneer in the design and construction of aircraft and sea craft, in particular flying-boats and high-speed motor-boats.

Scriabin, Alexander (1872–1915), Russian composer and pianist. He studied at the Moscow conservatoire, where he was later professor of the pianoforte, 1898–1904. He was deeply interested in theosophy, and in such works as *The Divine Poem* and *Prometheus: a Poem of Fire* he attempted to unite music and philosophy.

Seeley, Sir John Robert, K.C.M.G. (1834–95), was an historian of note, but acquired his chief fame as a writer by his *Ecce Homo* and *Natural Religion*.

Segovia, Andrés (b. 1894), Spanish concert-guitarist. He has adapted works by Bach, Haydn, Mozart, and other classical composers to the guitar.

Selfridge, Harry Gordon (1858–1947), the American who revolutionised the British department store when he opened the famous shop of Selfridges in Oxford Street in 1909. Noted for his ambitious advertising and lavish entertaining.

Seneca, Lucius Annaeus (*circa* 4 B.C.–A.D. 56), the famous stoic philosopher, who was tutor to Nero, and one of that emperor's most influential advisers; he was sentenced to end his own life, a sentence which he courageously carried out.

Senefelder, Alois (1772–1834), was the son of an actor at Munich, and himself engaged in dramatic composition. Being too poor to bear the cost of having his works printed, he turned his attention to inventing lithography, the main feature of the invention being discovered by accident.

Severus, Lucius Septimius (146–211), was Roman Emperor from 193 to his death. After many victories in the East he passed over to Britain with an army, subjugated the Caledonians, and repaired and partly rebuilt the famous Hadrian's wall from the Solway Firth to the mouth of the Tyne. He died at York.

Sévigné, Marie de Rabutin-Chantal, Marquise de (1626–96), French woman of letters. Her letters to her daughter Françoise written in an unaffected elegance of style give a moving picture of fashionable society in 17th-century France.

Sgambati, Giovanni (1841–1914), Italian pianist and composer who revived interest in classical instrumental music in an age of opera. Well known is his quartet in D flat.

Shackleton, Sir Ernest (Henry), C.V.O., O.B.E. (1874–1922), commander of the Nimrod Farthest South expedition of 1907–9, reached within 100 miles of the South Pole, and embarked on a new expedition in 1914. He died whilst on a scientific voyage to the Antarctic.

Shaftesbury, Anthony Ashley-Cooper, 7th Earl of (1801–85), a distinguished philanthropist, identified himself with the Ten-Hours Bill, connected with the Ragged School Union, Reformatories, Refuges, and Christian Associations of many kinds.

Shakespeare, William (1564–1616), England's greatest poet and dramatist, was born at Stratford-on-Avon, and was the son of a tradesman of that town who must have been at one time fairly well-off, seeing that he was made an alderman, and afterwards served as High Bailiff. Later on, however, he appears to have been unfortunate and fallen into straitened circumstances. William was the eldest son, and was probably educated at the Stratford Grammar School, but very little is known of his career up to his eighteenth year, when we have it on record that he married Anne Hathaway, who was eight years his senior. Five years after his marriage he went to London, and the next we hear of him is that he was connected with the Globe Theatre and appeared in sundry small parts. He first appeared before the public as a poet in 1593, with his *Venus and Adonis*, following this in 1594 with *The Rape of Lucrece*. Shortly afterwards he was proprietor of the Globe Theatre, and also had an interest in the Blackfriars Theatre. Then he began that remarkable career of play-writing which has since been the wonder of the world. Thirty-eight plays comprise the Shakespeare canon. Thirty-six were printed in the First Folio of 1623 (the first collected edition of his dramatic works), of which eighteen had been published during his lifetime in the so-called Quartos. *Love's Labour's Lost* and *The Comedy of Errors* seem to have been among the earliest, being followed by *The Two Gentlemen of Verona*, and *Romeo and Juliet*. Then followed *Henry VI*, *Richard III*, *Richard II*, *Titus Andronicus*, *The Taming of the Shrew*, *King John*, *The Merchant of Venice*, *A Midsummer Night's Dream*, *All's Well that Ends Well*, *Henry IV*, *The Merry Wives of Windsor*, *Henry V*, *Much Ado about Nothing*, *As You Like It*, *Twelfth Night*. Then came some of his greatest plays, *Julius Cæsar*, *Hamlet*, *Troilus and Cressida*, *Othello*, *Measure for Measure*, *Macbeth*, *King Lear*, *Timon of Athens*, *Pericles*, *Antony and Cleopatra*, *Coriolanus*, *Cymbeline*, *A Winter's Tale*, *The Tempest*, *Henry VIII*, and *The Two Noble Kinsmen*. It was evident that his plays were remunerative, inasmuch as in a few years he was able to purchase property at Stratford, and when he retired from his profession (about 1610 or 1612) he returned to his native town to live in a house which he had himself built. He died at Stratford at fifty-two, and was buried in Stratford Church.

Sharp, Granville (1735–1813), slavery abolitionist and founder of the colony of Sierra Leone.

Shaw, George Bernard (1856–1950), brilliant Irish dramatist who conquered England by his pungent wit and devastating exposure of hypocrisy, cant and national weaknesses, and persistently expressed a highly individual opinion whether in his musical criticisms, socialist pamphlets or plays. He wrote many plays including *Man and Superman*, *Heartbreak House*, *Back to Methuselah*, *Saint Joan*, *The Apple Cart*, *Buoyant Billions*, most of which have important prefaces, sometimes equalling the play in length. Was music critic (1888–94) successively to the London *Star* and *World* and during this period wrote *The Quintessence of Ibsenism* and *The Perfect Wagnerite*. Joined the Fabian Society in 1884 and was awarded Nobel Prize for Literature in 1925. He was greatly interested in the reform of the alphabet to save time and labour, and left on trust part of his estate for the carrying out of his ideas. His house at Ayot St. Lawrence was taken over by the National Trust.

Shelley, Percy Bysshe (1792–1822), one of the most brilliant poetic geniuses of the 19th century, renowned for the daring and unorthodox opinions which he held. His *Queen Mab* (written when he was nineteen), his *Alastor*, *The Revolt of Islam*, *The Witch of Atlas*, and *Adonais* all breathe the true spirit of poetry,

securing him a place in the first rank of British poets. He showed fine dramatic gifts in the *Cenci* and *Prometheus Unbound*, almost reaching sublimity in the latter masterpiece. His *Adonais* was a splendid tribute to the genius of Keats. His first wife, whom he married while very young, committed suicide. He afterwards married Mary Wollstonecraft Godwin, and formed other attachments of a complicating nature. Was always at war with his family, and finally, after spending some time with Byron and Leigh Hunt and other friends in various parts of Italy, was drowned in the Gulf of Spezia by the capsizing of his boat in a storm.

Shepard, Ernest Howard (b. 1879), chief cartoonist of *Punch* since 1945. Illustrator of *Winnie-the-Pooh* and other books by A. A. Milne.

Sheppard, Very Rev. Hugh Richard Lawrie (Dick), C.H., D.D. (1880–1937), Vicar of St. Martin-in-the-Fields, London, 1914–27, where he established a reputation by his broadcast sermons and attracted large crowds of listeners. Dean of Canterbury, 1929–31; Canon of St. Paul's, 1934–37. Buried in Canterbury Cathedral.

Sheraton, Thomas (1751–1806), was the last of the great English cabinet-makers of the 18th century. The Sheraton style which he introduced marks a reaction against Chippendale (*q.v.*).

Sheridan, Rt. Hon. Richard Brinsley Butler (1751–1816), one of the greatest of English playwrights, whose comedies are frequently revived. Was born in Dublin, and educated partly at Harrow. Showing considerable capacity for dramatic composition he obtained an introduction to the Covent Garden management, and it was at the Covent Garden Theatre in 1775 that his first comedy, *The Rivals*, was produced, with such a gratifying result that Garrick, who was then at Drury Lane, opened up negotiations with the dramatist which ended in Sheridan becoming part (and ultimately sole) proprietor of Drury Lane. *The Duenna*, a musical comedy, was produced in 1775, and ran through the winter. From 1777 Sheridan managed Drury Lane, opening with an adaptation of Vanbrugh's *Relapse*. This was followed by the production of the greatest of his comedies, *The School for Scandal*, which had a wonderful success. In 1779 *The Critic* was given, and after that Sheridan wrote no more plays until 1789, when *Pizarro* was produced. In the meantime he had gained a high reputation in another sphere. In 1780 he obtained a seat in Parliament and although he only spoke on certain set occasions, he acquired a reputation for oratory which stood him in very good stead, and he filled one or two minor Ministerial offices, remaining in Parliament until 1812.

Sherman, General William Tecumseh (1820–91), a famous American soldier who, after taking part in the War with Mexico (1846–48), volunteered at the outbreak of the Civil War (1861). He took part in the battles of Bull Run and Shiloh, and was placed in command of the Army of the Tennessee (1863) and of the military division of the Mississippi with a force of 100,000. In 1864 there occurred the famous 300-mile march across Georgia to the sea. In 1865 his second march, through the Carolinas, culminated in the defeat of Johnston, which led directly to the termination of the war.

Sherrington, Sir Charles Scott, O.M., G.B.E., F.R.S., M.D., D.Sc. (1857–1952), one of the greatest of British scientists, and a leading authority on the physiology of the nervous system, whose research work over many years led to great advances in the surgery of the brain. Pres. of the British Association 1920, and of the Royal Society, 1920–25. Awarded Nobel Prize for Medicine, 1932.

Shirley, James (1596–1666), was an eminent dramatist and poet, imbued with the Elizabethan traditions. He and his wife are said to have died from shock after the Great Fire.

Shostakovich, Dmitry Dmitryevich (b. 1906), one of the most celebrated of present-day Russian composers. His music is complex, profound, and deeply significant of the Soviet age in which he lives. His works include operas, ballets, symphonies, chamber music, and music for films.

Sibelius, Jean Julian Christian (1865–1957), Finnish composer, generally acknowledged as the greatest of the century. Works include seven symphonies, violin concerto, several tone poems, about 200 pianoforte compositions and songs.

Sickert, (Walter) Richard (1860–1942), British painter and etcher; became President of Royal Society of British Artists, 1928.

Siddons, Sarah (1755–1831), the daughter of Roger Kemble, a theatrical manager. The greatest tragic actress of her time.

Sidgwick, Henry (1838–1900), Professor of Moral Philosophy at Cambridge, and besides being an eminent educationist in the broader sense, devoted himself with special success to the cause of women's education, Newnham and Girton being largely the outcome of his efforts.

Sidney, Sir Philip (1554–86), statesman, poet and soldier; was one of Queen Elizabeth's favourites, and a man of singular ability and bravery. While living in temporary retirement he composed his famous *Arcadia*, but did not allow it to be published in his lifetime. He did not lack for literary fame, however, his *Apology for Poetry* and *Defence of Poesy*, as well as numerous miscellaneous pieces all distinguished for their beauty of expression and tender sentiment, having won much favour, especially in the circle of the Court. In 1586 he was given a command in the Netherlands and was killed at Zutphen

Siemens, Sir William, F.R.S. (1823–83), a German born scientist and inventor, chiefly in the field of heat and electricity. Constructed many overland and submarine telegraphs. Brother of Werner v. Siemens, founder of the famous firm of Siemens-Halske.

Sienkiewicz, Henryk (1846–1916), famous Polish novelist; Nobel prizewinner, 1905 (*Quo Vadis*)

Sikorski, Wladyslaw (1881–1943), Polish general and statesman; Prime Minister during second world war.

Simpson, Sir James Young, Bt., F.R.S. (1811–70) the discoverer of the utility of chloroform as an anæsthetic, was a native of Scotland, and was a most accomplished experimental surgeon.

Sinclair, Upton (b. 1878), American novelist whose documentary novel *The Jungle* about the Chicago slaughteryards caused a sensation in 1906. Made a bold bid for election as Democratic candidate for the Governorship of California in 1934, but was defeated.

Singer, Isaac Meritt (1811–75), American mechanical engineer who devoted himself to the improvement of the early forms of the sewing-machine and patented a single-thread and chain-stitch machine.

Sisley, Alfred (1839–1899), French Impressionist painter of English origin. Painted with great delicacy and sensitivity, landscapes, villages, trees, and rivers. Influenced by Corot and Manet.

Sitwell, Edith (Louisa), D.B.E. (b. 1887), English poet whose works include *Bucolic Comedies*, *Gold Coast Customs* and *Collected Poems*. Her two brothers are **Osbert** (b. 1892), a well-known poet and novelist, and **Sacheverell** (b. 1900), a poet and critic.

Slim, Field-Marshal Sir William J., K.G., G.C.B., G.C.M.G., G.C.V.O., G.B.E., D.S.O., M.C. (b. 1891), Gov.-Gen. of Australia 1953–59. In 1943 took command of the 14th Army in Burma, later becoming commander of the Allied Land Forces, S.E.A.C., and then Commandant of the Imperial Defence College. In 1947 joined the Railway Executive, but left a year later to succeed Lord Montgomery as Chief of the Imperial General Staff (1948–52).

Sloane, Sir Hans, Bt., F.R.S. (1660–1753), was born in County Down, Ireland, but settled in London, and became famed as a physician and naturalist. For some years he held the office of President of the Royal College of Physicians, and was elected President of the Royal Society in succession to Sir Isaac Newton. His Library of 50,000 vols., and treasures in natural history and MSS., worth from £50,000 to £80,000, were offered by his will to, and bought by the nation for £20,000, and with that nucleus the British Museum was founded.

Slowacki, Julius (1809–49), Polish romantic poet. He was a revolutionary, lived in exile and died in Paris. His tragedies include *Kordian*, *Belladyna* and *Lilli Weneda*.

Smeaton, John (1724–92), who rebuilt Eddystone Lighthouse, which had been burned down; he

subsequently constructed many important works in connection with harbours and canals. He was also the inventor of an improved blowing apparatus for iron-smelting.

Smetana, Bedřich (1824–84), Czech composer, creator of a national style. He was principal conductor of the Prague National Theatre, for which he wrote most of his operas, including *The Bartered Bride* and *The Kiss*. Best known of his other compositions are the cycle of symphonic poems *My Country* and the string quartets *From My Life*. He became totally deaf in 1874, suffered a mental breakdown, and died in an asylum.

Smiles, Dr. Samuel (1812–1904), was in early life a medical practitioner; achieved wide popularity by his *Self Help*, a book that has had an enormous sale.

Smith, Adam, F.R.S. (1723–90), the father of the science of political economy. Author of *Theory of Moral Sentiments* and *Wealth of Nations*, which immediately obtained the admiration of the leading men of the day, and secured him the friendship of Gibbons, Hume, Burke, Reynolds, and Dugald Stewart.

Smith, Sir Grafton Elliot, M.A., Litt.D., D.Sc., F.R.S. (1871–1937), Australian anatomist and archaeologist who was successively Professor of Anatomy in the University of Manchester, in the Egyptian Government School of Medicine, Cairo, in University College, London, and from 1933 until his death in Jan. 1937 Fullerian Professor of Physiology at the Royal Institution. He conducted brilliant researches on the structure of the mammallian brain, and stood in the front rank of comparative anatomists. His works include *The Royal Mummies* (1912), *Tutankhamen* (1923), *The Evolution of Man* (1924), and the *Diffusion of Culture* (1933).

Smith, Captain John (1580–1631), the noted seafarer and adventurer who in 1605 was the leading spirit of an expedition to Virginia, and founded Jamestown.

Smith, Joseph (1805–44), founder of Mormonism, son of a Vermont farmer. Claimed to have been granted revelation of the *Book of Mormon*, which came to be held as equal in authority and as a necessary supplement to the Scriptures. Smith, who was murdered, was not a polygamist; Brigham Young, who succeeded him, was. *See* Mormonism. Gen. Inf.

Smith, Sydney (1771–1845), an Anglican divine, who enjoyed a great reputation as a wit and writer. Founder of and contributor to the *Edinburgh Review* and author of *Peter Plymley's Letters*, supporting Catholic Emancipation.

Smollett, Tobias George (1721–71), a famous English novelist and humorist, whose *Roderick Random*, *Peregrine Pickle*, *Count Fathom* and *Humphrey Clinker* abound in fun and genial characterisation, while their pictures of sea-life are inimitable.

Smuts, Field-Marshal Rt. Hon. Jan Christiaan, O.M., C.H., K.C. (1870–1950), South African soldier and statesman, one of the dominating political figures of our century. Born in Cape Colony, studied at Cambridge University, and called to the Bar. Was an outstanding Boer commando leader during the South African War, but afterwards worked for friendship with the British and took office in Botha's Government when the Union was set up in 1910. In the first world war joined the Imperial War Cabinet. As Prime Minister, 1912–24, helped to launch the League of Nations, and more recently was associated with the United Nations. Prime Minister, Foreign Minister and Minister of Defence from 1939 to 1948 when he was defeated at the General Election by the Nationalists under Dr. Malan. He was a keen botanist; Pres. of British Association, 1931. His book *Holism and Evolution*, published in 1926, was widely discussed in the scientific world.

Smyth, Dame Ethel Mary (1858–1944), English composer, the daughter of a general, and a militant suffragette. She studied in Germany, where her most important opera *The Wreckers* was first produced. She also wrote chamber music, a comic opera *The Boatswain's Mate*, and a *Mass in D*.

Snyders, Frans (1597–1657), a great Flemish still-life and animal painter who studied under Breughel.

Soane, Sir John, R.A. (1753–1837), an eminent architect who designed numerous public buildings. By his will he left his museum, library, pictures, etc., for the use of the public, and the house in which he lived at Lincoln's Inn Fields still constitutes the Sir John Soane Museum.

Sobieski, John III. (1624–96), King of Poland from 1674, and heroic defender of his country from Cossacks, Tartars, and Turks.

Socinus, Lælius (1525–62), an Italian Protestant thinker and anti-Trinitarian, founder with his nephew Faustus Socinus (1539–1604), of the Socinian system of theology.

Socrates (470–399 B.C.), Greek philosopher and great intellectual leader, was the son of a sculptor and for some time followed that calling himself, but, having other ambitions, joined the army, and was present at the battle of Potidæa, and also at the battle of Delium, saving the life of Alcibiades in the first, and of Xenophon in the second. Returning to Athens he devoted himself to study and began to exhort the people on public questions and the conduct of life. Socrates wrote nothing himself, but we know of his teachings through the writings of his pupils Xenophon and Plato. In 399 B.C. he was charged with impiety and with corrupting the morals of the young, found guilty, and sentenced to death, events immortalised in Plato's *Apology*, *Crito*, and *Phaedo*.

Soddy, Frederick, M.A., LL.D., F.R.S. (1877–1956), Prof. of Inorganic and Physical Chemistry, Univ. of Oxford, 1919–36. Nobel Laureate in Chemistry 1921. The foundation of the isotope theory was laid by him in Glasgow about 1912 before the physicists became prominent in that field.

Solon (638–558 B.C.), was one of the Seven Sages of Greece, and became an eminent legislator, after having made a reputation as a poet. Solon's Laws were so highly esteemed that they were adopted by the Romans in the Twelve Tables.

Solyman (1490–1566), the celebrated Ottoman Sultan known as "the Magnificent," who won fame as a conqueror, law-giver, administrator, and patron of learning.

Somerset, 1st Duke of (1506–52), was Protector of England in the early part of the reign of Edward VI., but was deposed from power, tried for felony, and executed. A liberal and tolerant ruler who opposed enclosures and pursued a moderate religious policy.

Sophocles (495–406 B.C.), the famous Athenian dramatist who enjoyed the highest popularity at Athens, and in a contest with Æschylus was crowned the victor. Of the 100-odd plays of Sophocles only seven have survived: *Antigone*, *Electra*, *Œdipus*, *Ajax*, *Trachiniæ*, *Philoctetes*, and *Œdipus at Colonus*.

Soult, Marshal Nicolas Jean de Dieu, Duke of Dalmatia (1769–1851), was one of Napoleon's favourite and most capable generals, distinguishing himself in the Swiss and Italian campaigns, and also in the Peninsular War, where he was Wellington's bravest opponent.

Sousa, John Philip (1854–1932), American bandmaster and composer of numerous stirring marches. His father was Portuguese and his mother German.

Soustelle, Jacques, D. ès. L. (b. 1912), French scientist and controversial figure in French politics. As leader of the U.N.R. (Union for a New Republic) he planned and carried through the revolution which brought General de Gaulle back to power in 1958. Dismissed from Government, Feb. 1960.

Southey, Robert (1774–1843), poet and author. In 1803 he went to live near Keswick to be near Coleridge where he resided until his death. In 1813 he was made Poet Laureate. In poetry he was overshadowed by the greater genius of Byron and Shelley, but in prose he was eminently successful, his *Life of Nelson*, his *Doctor*, *Commonplace Book*, and other works being as strong and vigorous as his verse was tame.

Southwell, Robert (1561–95), a famous Jesuit and religious poet of Elizabethan times. Beatified in 1929.

Spaak, Paul-Henri (b. 1899), Belgian statesman; first President of the U.N. General Assembly in 1946 and of the Assembly of the Council of Europe during its first session in 1949. Sec. Gen. of NATO, 1957–.

Spaatz, General Carl Andrew (b. 1891), American soldier who held high commands in Europe, North Africa, and the Pacific, 1942–46.

Spartacus, a Thracian who became a Roman slave and gladiator in Capua, and headed an insurrection in Italy in 73 B.C. The slaves he raised routed several Roman armies, but he was eventually defeated by Crassus in 71 B.C. and slain.

Speke, Capt. John Hanning (1827–64), was the discoverer, along with Lt.-Col. J. A. Grant, of the Kagera, the main source of the White Nile, in 1862. In 1856 he discovered Lake Tanganyika and in 1858 Victoria Nyanza.

Spencer, Herbert (1820–1903), was the son of a Derby schoolmaster. For some time followed the profession of civil engineer. His first book was published in 1851, under the title of *Social Statics*, when he was filling the position of sub-editor of the *Economist*. In 1855 his *Principles of Psychology* appeared, in which he seems to have anticipated Darwin's theory of Evolution. The *System of Synthetic Philosophy* began to appear in 1860, and the last of its ten volumes was issued in 1896.

Spencer, Sir Stanley, C.B.E., R.A. (1891–1959), British artist whose work shows great visionary and spiritual power. His paintings include the Resurrection pictures and the Cookham Regatta series.

Spenser, Edmund (1552–99), was born in London, educated at Cambridge, and early attracted notice by his poetic writings. After the publication of his *Shepheardе's Calendar*, he was made known to Queen Elizabeth, and in 1580 received the appointment of Secretary to the Lord Deputy of Ireland, and in the division of confiscated lands that afterwards took place, Spenser received Kilcolman Castle and 3,000 acres of land. Here he wrote his *Faerie Queene*. In 1598 a rebellion broke out, and Spenser's castle was burned to the ground. He then returned to London, and there died.

Spinoza, Baruch or Benedict (1632–77), one of the greatest of modern philosophers, was born at Amsterdam, the son of a Portuguese Jew who had settled there as a merchant. He had a sceptical turn of mind and having expounded philosophical doctrines antagonistic to Judaism, was excommunicated by the rabbis as a heretic. He owed much to Descartes and in 1663 published his work on the Cartesian philosophy. The attainment of truth was his one object in life. Indifferent to money, he spent his life in study and earned his living as a lens grinder. His writings have had an extensive and enduring influence though during his lifetime some of his works, including his *Ethics*, were not allowed to be published.

Spofforth, Reginald (1770–1827), a writer of glees, including *Hail, Smiling Morn*.

Spurgeon, Rev. Charles Haddon (1834–92), a renowned Baptist who preached at The Tabernacle, near the Elephant and Castle, London, from 1861 until his death.

Squire, Sir John Collings (b. 1884), Englishman of letters. He engaged in journalism, and edited the *New Statesman* 1913–18, and was the founder and editor of the *London Mercury*, 1919–34, with which his name is inseparably connected. A prolific writer, he published among other works *Grub Street Nights*, *Steps to Parnassus*, *Collected Parodies*, *American and other Poems*, *Outside Eden*, also many volumes of collected criticism.

Staël, Madame de (Anne Louise Germaine Necker, Baronne de Staël-Holstein) (1766–1817), the daughter of Necker, the famous Finance Minister under Louis XVI., was married to Baron de Staël (Swedish Minister) at twenty. She was a brilliant woman, deeply imbued with philosophical sentiments. Two years after her marriage she made a considerable impression by her *Letters on Rousseau*, and was regarded as in sympathy with the Revolution. Later on, however, she was in disfavour, first with the Revolutionary leaders, and then with Napoleon, and was in turn exiled by both and during this time wrote *Corinne* and other able works.

Stalin, Generalissimo Joseph Vissarionovich (Djugashvili) (1879–1953), Soviet statesman who for nearly thirty years was leader of the Russian people. Studied for the priesthood at the Tiflis theological seminary. From the age of 17 was an active revolutionary and took important part in the civil war after 1917. After the death of Lenin became the outstanding figure in Russia and his aim to make Russia a great industrial power was carried into effect by modernizing agriculture on socialist lines and by a series of five-year plans, the first of which was introduced in 1929. Assumed military leadership against the German invasion, June 1941. Attended the Allied war conferences at Teheran, Yalta, and Potsdam. The denunciation of Stalin and the "personality cult" by M. Khruschev at the Soviet Communist Party Congress in Feb. 1956 has led to profound and far-reaching political consequences in other Communist countries.

Stanford, Sir Charles Villiers, Mus. D. (1852–1924), Professor of Music at Cambridge University, and Professor of Composition and Orchestral Playing in the Royal College of Music. An organist and conductor of remarkable ability, and a composer of much fine instrumental choral, operatic, and other music.

Stanley, Sir Henry Morton, G.C.B., (1841–1904), English explorer, after an adventurous early career during which he fought for the Confederates in the American Civil War, joined the *New York Herald* as a correspondent in 1867 and was commissioned by Gordon Bennett to search for Livingstone. In 1871 he discovered the great missionary at Ujiji and with him explored the northern end of Lake Tanganyika. After further exploration he founded the Congo Free State in 1879. Among his books were *How I found Livingstone*, *Through the Dark Continent*, *In Darkest Africa*, and an *Autobiography*.

Steele, Sir Richard (1672–1729), b. in Dublin, founder of *The Tatler*, which made a great hit his friend Addison contributing many papers Two years later he and Addison were associated in *The Spectator*, Addison, however, being the leading contributor; the *Guardian* was another of Steele's ventures. He sat in Parliament for some time, and was knighted by George I.

Steer, Philip Wilson, O. M. (1860–1942), was the most distinguished of British landscape painters, and a fine portraitist.

Stefansson, Vilhjalmur (b. 1879), a famous Arctic explorer, born in Manitoba of Icelandic parents. Took part in the Anglo-American (1908–12) and Canadian (1913–18) Arctic expeditions.

Stein, Sir Aurel, K.C.I.E. (1862–1943), was a famous British archæologist who conducted expeditions, chiefly to Chinese Turkestan, resulting in priceless additions to the British Museum and the Delhi Central Indian Museum. Explored Baluchistan, 1926–28, and South Iran, 1932–33. Was Superintendent of Archæological Survey, North-West Frontier Circle, India 1910–29.

Stendhal, pseudonym of the French novelist, Marie Henri Beyle (1783–1842); *Le Rouge et le Noir*, *La Chartreuse de Parme*.

Stephen (1105–54) was King of England from 1135 to his death, usurping the crown that belonged to Matilda, the daughter of Henry I.

Stephen Sir Leslie, K.C.B. (1832–1904), an eminent writer, critic and biographer. Edited the *Cornhill Magazine* (1871–82), and the *Dictionary of National Biography* (1882–91). He was the father of Mrs. Virginia Woolf.

Stephenson, George (1781–1848), was born at Wylam, near Newcastle, and up to 1804 was mainly engaged in ordinary colliery occupations. In 1804, however, an engagement as brakesman at Killingworth colliery brought him in touch with the working of Watt's steam engine, and his first efforts in invention were in improving one of those engines, showing so much ability that he was offered an engine-wright's position at Killingham, which he held for some time. Then it was that he began to think seriously of producing a locomotive engine, and managed to construct an engine that would draw coal trucks at the rate of four miles an hour. In 1821, when the Stockton and Darlington Railway was undertaken, he was appointed engineer, and when the railway was opened in 1825, as a line for the transport of coal only, Stephenson won his first great triumph, by putting a locomotive on the line that was able to draw a train of thirty-eight carriages, laden with goods and passengers, at a rate of twelve miles an hour. George Stephen-

son, subsequently, assisted by his son Robert, constructed the Liverpool and Manchester line, and after that the railway era commenced.

Stephenson, Robert, F.R.S. (1803–59), the only son of George Stephenson, attained great eminence as a civil engineer, constructing numerous important railways and bridges, being designer and contractor for the High Level Bridge at Newcastle, the Menai and Conway Tubular Bridges, the Victoria Bridge across the St. Lawrence at Montreal, and two notable bridges over the Nile.

Sterne, Laurence (1713–68), one of Britain's greatest humorists. His great work *Tristram Shandy*, the first two volumes of which were published in 1759, and the last in 1767, was so unique in character and so sparkling with wit and high spirits that, despite a certain coarseness, it made him famous. He also wrote *The Sentimental Journey*, and published some volumes of sermons.

Stevenson, Robert, F.R.S.E. (1772–1850), a native of Glasgow, and famed as a builder of lighthouses, including that on Bell Rock. He also invented the "flashing" system of throwing light at sea.

Stevenson, Robert Louis (1850–94), was the Scottish author of a remarkable series of essays, stories, and poems, including *Travels with a Donkey*, *Virginibus Puerisque*, *Treasure Island*, *Kidnapped*, *Dr. Jekyll and Mr. Hyde*, and *A Child's Garden of Verses*. He always suffered from delicate health and travelled extensively, finally settling in Samoa with his Californian wife, formerly Mrs. Osbourne. His literary influence was considerable, particularly on the generation which followed him.

Stinnes, Hugo (1870–1924), German industrialist who built up a huge coal-mining, iron and steel, and transport business, and also developed a large shipping concern. His group controlled the greater part of Germany's coal, iron and steel supply. In 1920 he entered the Reichstag, and later became a newspaper proprietor.

Stirling, Elizabeth (1819–95), English organist whose recitals in London exercised much influence and made Bach's music more widely known. She wrote the part-song "All among the barley."

Stoker Bram (Abraham) (1847–1912), b. in Ireland, author of *Dracula* and *Personal Reminiscences Of Henry Irving*, which records his association with the actor in managing the Lyceum Theatre.

Stokes, Sir George Gabriel, LL.D., F.R.S. (1819–1903), a distinguished Irish mathematician and physicist who became Lucasian Professor of Mathematics at Cambridge, 1849; Secretary of the Royal Society 1854–85 (President 1885–90) and was President of the British Association, 1869. To him is due the modern theory of viscous fluids, while in optics his theory of diffraction opened up hitherto unexplored fields of research.

Stopes, Marie Carmichael, D.Sc., Ph.D., F.L.S., F.R.L.S. (1880–1958), woman scientist who published many works on birth control.

Stowe, Harriet Elizabeth Beecher (1811–96), authoress of *Uncle Tom's Cabin* which exposed the horrors of slavery and did much to advance the cause of abolition.

Strachey, Rt. Hon. Evelyn John St. Loe (b. 1901), Labour M.P. for Dundee West. Writer of lucid and vigorous books on socialist economics which include *The Coming Struggle for Power* (1932), and *The End of Empire* (1959).

Stradivari, Antonio (1644–1730), an Italian maker of violins, first in his art in the world of all time.

Strafford, Thomas Wentworth, Earl of (1593–1641), the distinguished statesman, sent by Charles I. to Ireland as Lord Deputy in 1631. Was the founder of the Irish linen manufacture. He obtained the name of "Thorough" by his sweeping measures for asserting the King's authority, but was ultimately impeached on a variety of charges, found guilty, and executed.

Strauss, David Friedrich (1808–74), German theological writer, who made a great stir in the religious world by his *Life of Jesus*, published in 1835, which attempted to prove that the evangelical history mainly rested on a series of myths.

Strauss. Family of Viennese musicians. **Johann Strauss** (1804–49), "the elder," was a composer of dance music who with Joseph Lanner established the Viennese waltz tradition. His son, **Johann Strauss** (1825–99), "the younger," although not so good a violinist or conductor as his father, is the more famous as the composer of over 400 waltzes, which include *The Blue Danube* and *Tales from the Vienna Woods*. Two of his brothers **Joseph Strauss** (1827–70) and **Eduard Strauss** (1835–1916) were also composers and conductors.

Strauss, Richard (1864–1949), German composer and conductor, the son of a horn player in the opera orchestra at Munich. He succeeded von Bülow as court musical director at Meiningen. Among his compositions which are widely acclaimed are the operas *Salome*, *Elektra*, and *Der Rosenkavalier*, the symphonic poems *Don Juan*, *Till Eulenspiegel*, and *Don Quixote*, and many songs of great lyrical beauty.

Stravinsky, Igor (b. 1882), Russian composer and conductor, pupil of Rimsky-Korsakov. His early ballets *The Fire Bird* and *Petrushka* (regarded by some as his greatest work) were commissioned by Diaghilev and are representative of his early, romantic style. *Pulcinella*, *Apollon musagète*, *Persephone*, and the opera *Oedipus Rex* are later works in his neo-classical style. Younger composers have been much influenced by his music. He became a French citizen in 1934, and a U.S. citizen in 1945.

Strindberg, Johan August (1849–1912), Swedish writer of intense creative energy. His work is subjective and reflects his personal conflicts. He married three times but never happily. He produced some fifty-five plays as well as novels, stories, poems, and critical essays. *Lucky Peter*, *Gustav Adolf*, *Till Damascus*, *The Father*, *Miss Julie* are some of his plays.

Strong, Leonard Alfred George (1896–1958), poet, novelist, short story writer, and critic. Author, among other books, of *Dublin Days*, *The Brothers*, and *The Last Enemy*, and with Cecil D. Lewis editor of *A New Anthology of Modern Verse*.

Stuart, Arabella (1575–1615), daughter of the Earl of Lennox and cousin of James I., whose next heir she was both to the English and Scottish thrones. In 1610 she married William Seymour, afterwards Earl of Hertford and Duke of Somerset, and thereby incurring the king's displeasure, she was incarcerated in the Tower of London, where she died insane.

Suckling, Sir John (1609–42), wit, courtier, and poet; served under Gustavus Adolphus and in Charles I's first Scottish war (1639). Being concerned in a plot to rescue the Earl of Strafford from the Tower, he fled to France, where he may have killed himself. He wrote poems, ballads, songs, and prose work and is said to have invented cribbage.

Sudermann, Hermann (1857–1928), German dramatist, poet and novelist. His brilliant novel, *Frau Sorge* (1887), translated into English as *Dame Care* (1892), reached its 125th edition in 1912. From 1890 he produced a succession of realistic plays and novels.

Sukarno, Achmed (b. 1901), President of Indonesia since 1945.

Sullivan, Sir Arthur Seymour, C.V.O. (1842–1900), gifted composer, gained his first musical experiences as choir-boy at the Chapel Royal, and later studied at Leipzig. He composed oratorios but at the same time cultivated a lighter vein with pronounced success. Became famous for the light operas written in collaboration with W. S. Gilbert, which include *Trial by Jury*, *The Sorcerer*, *H.M.S. Pinafore*, *Pirates of Penzance*, *Patience*, *The Mikado*, *The Yeomen of the Guard*, *The Gondoliers*.

Sully, Maximilien de Béthune, Duc de (1560–1641), a French Protestant statesman, a friend and companion of Henry of Navarre. His *Memoirs* made notable reading.

Sun Yat Sen, Dr. (1867–1925), the founder and first President of the Chinese Republic, 1912, resigning almost immediately in favour of Yuan Shih Kai. Was the first graduate of medicine at Hongkong, 1891. Founded in 1905 the China Revolutionary League in Europe and Japan, and played a large part in the revolution of 1911, being elected President of the Southern provinces by the Nanking Convention in 1912.

Sutro, Alfred (1863–1933), author and dramatist.

His most successful plays were *The Walls of Jericho* (1904) and *John Glayde's Honour* (1907).

Swedenborg, Emanuel (1689–1772), Swedish philosopher, scientist, mystic. In later life he announced that Divine authority had been given him to explain natural and spiritual evidences. He published in quick succession *Arcana Coelestia*, *The Apocalypse Revealed*, *Four Preliminary Doctrines*, and *The True Christian Religion*. He also claimed that his soul had been permitted to travel into hell, purgatory and heaven. His works became the scriptures of the sect named Swedenborgians.

Sweelinck, Jan Pieterszoon (1562–1621), famous Dutch organist and composer of sacred music. In his fugues he was the first to make independent use of the pedals, and thus prepared the way for Bach.

Swift, Jonathan Dean (1667–1745), was born at Dublin, educated at Trinity College at the expense of an uncle, became secretary to Sir William Temple, and looked for political preferment, but it did not come. Entering the Church, he was made Dean of St. Patrick's in 1713. Getting entangled in political controversy, and changing his views from the Whig to the Tory side, he lost favour with the popular party, but consoled himself with a devotion to literature, which he greatly enriched by some powerful satires, poems and discourses. *Gulliver's Travels*, *A Tale of a Tub* and *The Battle of the Books* are among the best-known works. His romantic attachment to "Stella" (Hester Johnson, whom he is believed to have married privately) and "Vanessa" (Esther Vanhomrigh), and their devotion to him, are familiar stories.

Swinburne, Algernon Charles (1837–1909), was educated at Oxford, and in the early 'sixties of last century gave to the world a number of poems of singular poetic beauty and musical charm, which procured him a high rank among English poets. Swinburne's most famous productions include *Atalanta in Calydon*, *Songs before Sunrise*, *Bothwell*, and *Mary Stuart*. Perhaps the best of his writings is his essay on William Blake.

Swithin, St. (*circa* 800–862), Bishop of Winchester in 852, and on the translation of his remains to a shrine in the interior of the cathedral from the graveyard, fixed for July 15th, 971, violent rain intervened, and, it is said, continued for forty days; hence the superstition as to rain upon St. Swithin's Day.

Symonds, John Addington (1840–93), acquired fame as a poet and writer on *The Renaissance Period in Italy*.

Synge, John Millington (1871–1909), Irish poet and playwright. His best known work, *The Playboy of The Western World*, met with a hostile reception when first produced in Dublin in 1907, but English audiences were at once enthusiastic.

Szigeti, Joseph (b. 1892), famous Hungarian violinist, who made his début in 1905, toured through Europe and settled for some years in England. He made an immense reputation on the Continent, and was Prof. at the Geneva Conservatorium, 1917–24.

Szymanowski, Karol (1833–1937), Polish composer and director of the Conservatoire at Warsaw.

T

Tacitus, Caius Cornelius (55–*circa* 120). His chief claim to remembrance is that he was one of the ablest of Roman historians, and left behind him a number of works; among them a life of Agricola and his *Annales*, which have formed the ground-work of much that has since been written on the period he covered.

Tacitus, Marcus Claudius (205–276), the Roman Emperor who succeeded Aurelian in A.D. 275. His short reign was wise and marked by moderation.

Taft, Wm. Howard (1857–1930), Chief Justice United States 1921–30. President of the United States 1908–12.

Tagore, Rabindranath (1861–1941), a Bengal poet who won the Nobel Literature Prize in 1913.

Talbot, William Henry Fox, F.R.S. (1800–1877), English scientist who first discovered the principles of photography in 1833. Inventor of the calotype or Talbot-type process of which modern photography is a development.

Talleyrand-Périgord, Charles Maurice de (1754–1838), French politician and diplomat, led a mission to England in 1792 and was Foreign Minister from 1797 until 1807. He represented France at the Congress of Vienna.

Tallis, Thomas (*c.* 1510–85), a distinguished musician, who was, as organist, attached to the Chapel Royal under Henry VIII., Edward VI., Mary, and Elizabeth, and was the composer of some of the finest of our Church music.

Tamerlane, or Timûr the Tartar (1335–1405), descendant of a follower of Jenghiz Khan, and founder of the Mogul Dynasty in India. He succeeded as chief of the Berlas Turks in 1361, and in turn conquered Turkestan, Persia, and Syria. He was a masterful warrior, and a terrible butcher, the scourge of the East in his day, and, after establishing himself in India, died whilst preparing for the invasion of China. His familiar name is a corruption of Timûr-lenk = "Timur the Lame."

Tannhäuser, a mythical German minnesinger of the 13th century, who belonged, according to the legend handled so romantically in Wagner's opera, to the Salzburg family of Tanhusen, and was the beloved of Lisaura.

Tarkington, (Newton) Booth (1869–1946), a leading American novelist, author of a wide variety of books, of which probably the best known is *Monsieur Beaucaire*, a sentimental romance, the dramatic version, in which he collaborated achieving a great success.

Tarquin Superbus (or "**the Proud**"), the last King of Rome. Was banished 510 B.C. After his deposition came the Consuls.

Tarquin the Elder, 5th King of Rome, succeeded Ancius Mastius 615 B.C., reformed the laws, embellished the city, and was assassinated.

Tartini, Giuseppe (1692–1770), Italian violinist. He discovered the "third sound" resulting from two notes sounded together, a scientific explanation of which was later given by Helmholtz. His best-known sonata is *The Devil's Trill* written after a dream in which the devil played to him.

Tasman, Abel Janszoon (*circa* 1602–59), a famous Dutch navigator; in 1642 he discovered the island of Tasmania and New Zealand shortly thereafter.

Tassigny, Jean de Lattre de, Marshal of France, Hon. G.C.B. (1890–1952), outstanding commander of the Free French Movement in Second World War; High Commissioner and C.-in-C. Indo-China, 1950–52. C.-in-C. Land Forces, Western Europe, 1948–50.

Tasso, Torquato (1544–95), was one of the great Italian poets of the 16th century.

Tauber, Richard (1893–1948), Austrian tenor, sang Mozart and German Lieder impeccably; made first appearance in England, 1931, in Lehar's *The Land of Smiles* which brought him world-wide fame.

Taylor, Brook, LL.D., F.R.S. (1685–1731), an English mathematician of high attainments, who solved the problem of the centre of oscillation, and is best known as the discoverer of "Taylor's theorem."

Taylor, Jeremy (1613–67), an English divine of great influence. The most famous of his works was his *Holy Living and Holy Dying*.

Tchaikovsky, Peter Ilich (1840–93), Russian composer. His music is melodious and intensely emotional and he excelled in several branches of composition. Amongst his works are ten operas, including *Eugene Onegin* and *The Queen of Spades* (both from stories by Pushkin), six symphonies, including the *Little Russian* and the magnificent *Pathétique*, his last completed work, ballets, including *Swan Lake*, *The Sleeping Beauty*, and *The Nutcracker*, the fantasies *Romeo and Juliet* and *Francesca da Rimini*, the piano concerto in B flat minor, the violin concerto in D, and numerous songs.

Tedder, Marshal of the R.A.F., Arthur William, 1st Baron, G.C.B., B.A. (b. 1890), was Deputy Supreme Commander under Eisenhower for the invasion of Europe, Chief of the Air Staff, 1946–48; Chairman, Western Europe Chiefs of

Staff committee, 1948–50; Vice-Chairman of the Governors of the B.B.C., 1952–54; Chancellor Univ. of Cambridge, 1950.

Telford, Thomas (1757–1834), was a Scottish working stone-mason who became a great engineer and attained special fame as a builder of bridges, the Menai Suspension Bridge being, perhaps, his greatest work. He constructed the Ellesmere Canal, made many hundreds of miles of difficult mountain roads, was chief engineer of the Caledonian Canal, and altogether did an immense amount of public work.

Tell, William, a legendary figure in Swiss folk-lore. The story of his having been compelled by order of the imperial governor, Gessler, to shoot an apple from the head of his own son and his dramatic revenge is regarded as a legendary feat which has its origins in Teutonic myth. The Swiss hero of the Uri, however, played a great part in freeing his country from the Austrian yoke in the early part of the 14th century.

Temple, Most Rev. Frederick (1821–1902), a famous Anglican Churchman who became Headmaster of Rugby in 1858; in 1860 attained notoriety as the author of the first of the much-controverted *Essays and Reviews*, advocated the disestablishment of the Irish Church in 1868, was appointed Bishop of Exeter in 1869, translated to London in 1885, and in 1890 was raised to the Primacy. He made a strong Archbishop, and dominated the Church with his vigorous personality.

Temple, Most Rev. William, P.C., D.Litt., D.D. (1881–1944), one of the outstanding Christian leaders of his time and the son of Frederick Temple, was Archbishop of Canterbury, 1942–44, after being Headmaster of Repton, 1910–14, Bishop of Manchester, 1921–29, and Archbishop of York, 1929–42. His influence was felt among Christians of all denominations, and he strove for the unity of the Churches.

Temple, Rt. Hon. Sir William, Bt. (1628–99), English statesman and author; was Ambassador to The Hague in Charles II.'s time, and is understood to have been instrumental in bringing about the marriage between William of Orange and the Princess Mary. William III. twice offered him the position of Secretary of State, but he declined the honour, spending the years of his retirement at Moor Park (where Swift served him for a time as private secretary). Married **Dorothy Osborne** (1627–95), the letter-writer.

Templer, Field-Marshal Sir Gerald Walter Robert, G.C.B., G.C.M.G. K.B.E., D.S.O. (b. 1898), Chief of the Imperial General Staff, 1955–58, formerly High Commissioner and Director of Operations in Malaya.

Templewood, Samuel John Gurney Hoare, 1st Viscount, P.C., G.C.S.I., G.B.E., C.M.G. (1880–1959), Conservative politician; Sec. of State for Air, 1922–29; Sec. of State for India, 1931–35; Foreign Sec., June–Dec. 1935; Home Sec., 1937–39; Special Ambassador to Spain, 1940–44.

Teniers, David (the younger) (1610–94), was born at Antwerp, and his paintings of the old rustic Flemish life are unsurpassed in their humour and fidelity. He died at Brussels. His father, **David Teniers** the elder (1582–1649), was also one of the leading landscape painters of the time.

Tenniel, Sir John (1820–1914), for over fifty years leading artist of *Punch*, illustrated numerous books, including *Alice in Wonderland*.

Tennyson, Alfred Lord (1809–92), was Poet Laureate from 1850 to his death. Born at Somersby, in Lincolnshire, he showed poetic gifts while quite young, and in 1827, joined his brother Charles in the publication of *Poems by Two Brothers*. In 1847 he published *The Princess*; in 1850 *In Memoriam*, a poem of great beauty and depth of thought, in which he enshrined his affection for the memory of his dead friend Arthur Hallam; and in 1855 *Maud* appeared. His other works include *The Idylls of the Kings*, *Enoch Arden*, *Queen Mary*, *Harold*, and *Becket*.

Terence, Publius Terentius Afer (*c.* 184–159 B.C.), a Latin poet and dramatist, an African (Berber), who rose from the position of a slave to that of one of the most honoured men in Rome.

Teresa, St., or Theresa (1515–82), a Spanish saint and author, born at Avila, entered the Carmelite order in 1534, established a reformed order in 1562, became famous for her ascetic life and mystic visions, and died at Alba de Liste. Her religious writings include *The Way of Perfection* and *The Castle of the Soul*. She was canonised by Pope Gregory XV.

Terry, Dame Ellen, G.B.E. (**Mrs. James Carew**) (1848–1928), one of the most distinguished of English actresses. Played Shakespeare with Sir Henry Irving at the Lyceum and later appeared in plays of Bernard Shaw, who was her friend.

Tertullian, Quintus (*circa* 150–230), a Father and writer of the Latin Church. His chief work was his *Apologeticus*, a defence of Christianity.

Tetrazzini, Luisa (1871–1940), was an Italian prima donna who sprang into sudden prominence in 1907 by her wonderful singing at Covent Garden. She was hailed as a second Patti, and achieved a brilliant success.

Tetzel, John (*c.* 1460–1519), the German Dominican monk and Inquisitor, the scandal of whose sale of indulgences roused Luther to publish his memorable ninety-five theses at Wittenberg in 1517, and led up to the Reformation.

Thackeray, William Makepeace (1811–63), English novelist, author of *Vanity Fair*, *Pendennis*, *Esmond*, *The Newcomes*, *The Virginians*, *Philip* and *Lovel the Widower*. He edited the *Cornhill Magazine* from the first number, January, 1860, for a few years his most notable contributions being his *Roundabout Papers*. His *Yellowplush Papers* and *The Book of Snobs* (republished from *Punch*) were widely read and admired; and the lectures he delivered in America on *The Four Georges* were pungently powerful.

Thales of Miletus (*c.* 624–565 B.C.), a geometer, astronomer, and philosopher, and one of the seven wise men of ancient Greece. The earliest of the Ionian philosophers, he created a sensation by the pre-calculation and prediction of an eclipse of the sun, which took place 585 B.C. and he looked upon water as the basis of all material things.

Themistocles (*c.* 514–449 B.C.), Athenian soldier and statesman. By fortifying the harbour of Piræus as the port of Athens, by the remission of taxes on aliens, and by the creation of the Athenian navy, he established Athenian prosperity and made possible the later Athenian empire. Defeated the Persian fleet at Salamis in 480 B.C.

Theocritus (285–247 B.C.), one of the great Greek poets. Thirty *Idylls* have come down to us and a number of *Epigrams*.

Theodoric the Great (455–526), a celebrated King of the East Goths, born at Pannonia. In mediæval German romance he is known as "Dietrich von Bern," and had a reputation for good government, akin to that ascribed in England to King Alfred. He was the founder of the Gothic Kingdom of Italy.

Theodosius the Great (346–95) was Roman Emperor of the East for nearly twenty years. He gained victories over the Goths, and the year before his death became sole Emperor. Noted in ecclesiastical history for his conversion to Christianity, and for his submission to the penance imposed by St. Ambrose.

Theophrastus (*c.* 372–287 B.C.), succeeded Aristotle as President of the Lyceum at Athens. His *History of Plants* and his *Moral Characters* are the best known of his writings.

Thibaud, Jacques (b. 1880), famous French violinist.

Thierry, Jacques Nicolas Augustin (1795–1856), a distinguished French historian, known by his *History of the Norman Conquest*.

Thiers, Louis Adolphe (1797–1887), a French statesman and man of letters, author of *History of the French Revolution*.

Thomas, Dylan (1914–53), Welsh poet whose *Eighteen Poems* (1934) brought him instant recognition as an original and gifted artist. Other works include *Twenty-five Poems* (1936), *Deaths and Entrances* (1945), *Under Milk Wood*, a play for voices.

Thomson, James (1834–82), a Scottish poet who wrote *The City of Dreadful Night*.

Thomson, Sir (John) Arthur (1861–1933), was a well-known biologist.

Thomson, Sir Joseph (John), O.M., D.Sc., F.R.S. 1856–1940), physicist and mathematician;

Master of Trinity College, Cambridge, 1918–40; Cavendish Prof. of Experimental Physics, Cambridge, 1884–1919. Awarded Nobel Prize in 1906 for his work on conduction of electricity through gases; also discovered the electron. Wrote learnedly on electricity, magnetism, radio-activity, etc. His son, **Sir George Paget Thomson,** (b. 1892) F.R.S., is also a physicist and Nobel Prizeman; Master of Corpus Christi College, Cambridge.

Thoreau, Henry David (1817–62) was a natural philosopher and nature-worshipper, who forsook trade and devoted himself to a primitive kind of existence in the American woods. He was the friend of, and for a time lived with, Emerson, but in 1845 adopted his career of solitude, and pursued those studies of nature which afterwards gained him a high reputation. His *Walden, or Life in the Woods*, is a unique book.

Thorez, Maurice (b. 1900), Secretary General of the French Communist Party.

Thorndike, Dame Sybil, D.B.E., LL.D. (b. 1885), a celebrated British actress. She had a great success in *Macbeth*, also in G.B. Shaw's *St. Joan* and in several Greek tragedies. Wife of Sir Lewis Casson, the actor.

Thornycroft, Sir William Hamo, R.A. (1850–1925), English sculptor whose works include the Gladstone Memorial, the statue of General Gordon in Trafalgar Square, of Queen Alexandra in the Royal Exchange, Lord Granville in the Houses of Parliament, Cromwell at Westminster, and John Bright in Rochdale.

Thorpe, Sir (Thomas) Edward, C.B., Ph.D., D.Sc., F.R.S. (1845–1925), a noted English chemist. His chief research work was done on paraffin hydrocarbons, and the derivatives of fluorine and phosphorus. Was the author of a standard *Dictionary of Applied Chemistry* and a *History of Chemistry*.

Thorwaldsen, Bertel (1770–1844), a famous Danish sculptor.

Thucydides (*c.* 460–399 B.C.), the first scientific historian, was an Athenian and took part in the Peloponnesian War, about which he wrote his *History*. Attempted an impartial account, weighing the testimony of eye-witnesses and keeping to carefully verified facts. The *History* is a graphic narrative, but Thucydides was not merely a chronicler; he saw the general significance of particular events and wished to pass on the political lessons of the past to the future. The speeches which he put into the mouths of the various actors reveal the political ideas and climate of opinion of contemporary Greece, and include the famous Funeral Oration of Pericles.

Tiberius, Claudius (42 B.C.–A.D. 37), the second Emperor of Rome, had an evil reputation but was an able ruler and successful soldier. Spent his later years in Capri.

Tillett, Benjamin (1860–1943), M.P. for North Salford 1917–24 and again 1929–31, came into prominence in the great dock strike of 1889. He was the organiser and secretary of the Dockers' Union; for several years alderman of the L.C.C.; and an active labour leader. Chairman of the General Council T.U.C. 1928–29.

Tillotson, John (1630–94), a celebrated preacher at Lincoln's Inn, "Popery" and "Atheism" being the main objects of his attacks: in 1691 became Archbishop of Canterbury.

Tindal, Matthew (*c.* 1653–1733), noted English Deist.

Tintoretto (1518–94), Venetian painter whose aim it was to unite the colouring of Titian with the drawing of Michelangelo. He is among the most original and decorative of artists whose numerous paintings, mostly of religious subjects, were executed with great speed, some of them on enormous canvasses. His real name was Jacopo Robusti, and he was called Il Tintoretto (little dyer) after his father's trade. Three of his six children were painters.

Titian, or **Tiziano Vecelli** (1477–1576), one of the greatest of painters. He studied under the Bellinis, and made his first essays in painting for the public in conjunction with Giorgione, whom he soon surpassed. In 1511 he was at Padua, where he painted some notable frescoes; in 1512 he was back in Venice, with a studio on the Grand Canal, employed on important commissions. From this time forward he was in great demand, and exercised his marvellous powers almost to the end of his life, dying of the plague at ninety-nine.

Titiens (or **Tietjens**), **Teresa** (1831–77), a famous German operatic prima donna and concert-room singer.

Tito, Marshal (Josif Broz) (b. 1892), Prime Minister of the Federal People's Republic of Yugoslavia since 1945. Leader of the partisan forces which successfully fought against German occupation. President National Liberation Committee, 1943.

Titus (40–81), the Roman Emperor, and son of Vespasian. Attained great renown by his successful part in the Jewish war which terminated in the capture and destruction of Jerusalem: he was deemed a profligate and a tyrant, but no sooner was he in sole power than he exerted himself to the utmost to please the people, completed the Colosseum, gave plenty of exhibitions, built splendid baths, and otherwise made himself popular.

Tizard, Sir Henry Thomas, G.C.B., F.R.S. (1885–1959), scientist and administrator; Pres. British Association, 1948. Played important part in the higher scientific direction of the second world war and as Chair. Advisory Council on Scientific Policy, 1947–52.

Tocqueville, Alexis, Comte de (1805–59), author of *De La Démocratie en Amérique* and *De L'Ancien Régime*, which set out nineteenth-century liberal ideas.

Todd, Sir Alexander Robertus, D.Sc., F.R.S. (b. 1907), Prof. of Organic Chemistry at Cambridge, 1944– ; Chair. Advisory Council on Scientific Policy, 1952– ; Won Nobel Prize in 1952.

Tolstoy, Count Leo Nikolayevitch (1828–1910), was the most distinguished personality in modern Russian literature. Born of a good family, he was for a time in the army, but was so greatly moved by the trials and sufferings of the people that, out of pure sympathy of heart, he was impelled "to take up his pen and write." At twenty-four he published his *Childhood*, and in 1854, while in camp in the Crimea, wrote his *Tales from Sebastopol*, which procured him considerable literary fame. Later on he was a persistent advocate of progressive ideas, and, before the Emancipation Act for freeing all Russian serfs was enforced, he himself had given the serfs on his own estate their freedom. In 1862 he married, and settled down to a quiet country life, shortly afterwards publishing his *War and Peace* and *Anna Karenina*. In his latter years Tolstoy developed a sort of religious mysticism. Among his later works are *The Power of Darkness*, *The Kreutzer Sonata*, *The Cossacks*, *Ressurrection*, and *The End of the Age*.

Tooke, John Horne (1736–1812), English politician and pamphleteer, was a supporter of Wilkes and later Pitt. His tracts advocated reform. After the French Revolution was tried for high treason, but was acquitted.

Toole, John Lawrence (1832–1906), for half a century a popular English comedian.

Torquemada, Tomas de (1420–98), the chief officer of the Spanish Inquisition.

Torricelli, Evangelista (1608–47), Galileo's pupil. He invented the barometer and improved both the microscope and the telescope.

Toscanini, Arturo (1867–1957), famous Italian conductor, La Scala Theatre, Milan, 1898–1908 and 1920–29; at the Metropolitan Opera House, New York, 1908–15; and of the Philharmonic Symphony Society of New York, 1926–36. Returned to Milan in 1946 after a ten-year exile.

Toulouse-Lautrec, Henri de (1864–1901), French painter, whose pictures portray with stark realism certain aspects of Parisian life in the nineties.

Tovey, Sir Donald Francis (1875–1940), pianist and composer who for 25 years held the chair of music at the University of Edinburgh. As a child he showed remarkable talent, both as a pianist and in understanding the art of music. He graduated at Oxford with classical honours. Outstanding among his many writings is *Essays in Musical Analysis*, and his compositions include chamber music, a piano concerto, and an opera *The Bride of Dionysus*.

Toynbee, Arnold (1852–83), after graduating at Oxford, devoted himself to practical philanthropy and social reform. From his self-deny-

ing efforts sprang the settlement in East London —Toynbee Hall.

Toynbee, Arnold Joseph, C.H., Hon.D.Litt. (Oxford, Cambridge, and Birmingham) (b. 1889), eminent scholar and historian, nephew of above. Dir. of Studies Royal Inst. of Int. Affairs, 1925–55. Major work *A Study of History* (10 vols.) was completed in 1954.

Trajan (*circa* 52–117) was Roman Emperor from 98 to his death. His rule was enlightened, and he was esteemed by his people.

Tree, Sir Herbert Beerbohm (1852–1917), the London actor-manager who scored successes at the Haymarket and His Majesty's Theatre.

Trenchard, Marshal of the R.A.F., Viscount, G.C.B., O.M., G.C.V.O., D.S.O. (1873–1956), Chief of Air Staff, 1918–29; Chief Commissioner of Police, 1931–35; often known as the father of the Air Force and largely responsible for the establishment of the R.A.F. College at Cranwell and the Hendon Police College.

Trent, 1st Baron, of Nottingham (Jesse Boot) (1850–1931), founder of Boots Cash Chemists, Ltd.; a great benefactor of Nottingham, especially of the University of Nottingham.

Trevelyan, George Macaulay, O.M., C.B.E. (b. 1876), English historian, son of Sir George Otto Trevelyan and great nephew of Thomas Babbington Macaulay. Regius Professor of Modern History at Cambridge 1927–40; Master of Trinity College, 1940. Chancellor of Durham University, 1949. His chief works are: *History of England*; a trilogy of books on *Garibaldi*; *England under the Stuarts*; *England under Queen Anne*; *Grey of Fallodon*; *English Social History*; *An Autobiography and other Essays*.

Trevelyan, Rt. Hon. Sir George Otto, 1st Bt., O.M. (1838–1928), Liberal statesman and historian. Became Chief Secretary for Ireland in 1882, and was later Secretary of State for Scotland. Wrote a biography of his uncle, Lord Macaulay, which was highly praised. Father of Professor G. M. Trevelyan.

Trevithick, Richard (1771–1833), a Cornish mine-manager's son, who invented the road-locomotive, putting upon the highway on Christmas Eve, 1801, the first steam-propelled vehicle for passengers.

Trollope, Anthony (1815–81), author of many novels. His Barchester series depicts a number of scenes of higher clerical life with great fidelity and success.

Trotsky, Leon, name assumed by Lev Davidovich Bronstein (1879–1940), one of the leaders of the Bolshevist revolution. War Minister of the Bolshevist Government and its leading representative at the Brest-Litovsk conference of 1917–18. He differed from the Communist Party on policy and was dismissed from office in 1925. In 1929 took up exile in Mexico where he was assassinated.

Truman, Harry S. (b. 1884), President of the United States, 1945–52. Inherited the Presidency on the death of Roosevelt in 1945 and won the Pres. election in 1948. He took the historic decision to enter Korea in 1950, dismissed Gen. MacArthur in 1951, and will perhaps best be remembered for his "Point Four" programme of raising levels of living in backward, and underdeveloped countries.

Tulsi Das (1532–1623), mediæval poet of India whose great masterpiece *Rām-Charit-Mānas* (popularly known as the *Rāmayana* and based on the Sanskrit epic of Vālmiki) is venerated by all Hindus just as the Bible is in the West.

Turenne, Henri de la Tour d'Auvergne, Vicomte de (1611–75), a famous French commander and Marshal of France, who was highly successful in the Thirty Years' War.

Turgenev, Ivan Serveyvich (1818–83), was a friend of Gogol and Tolstoy, and a famous Russian novelist and short-story writer. His works were frequently satirical and directed against the oppression of the peasants by the nobles. Was the inventor of the term "nihilist" to describe the Russian anarchist movement.

Turner, Joseph Mallord William, R.A. (1775–1851), was the son of a London barber, but while quite a child showed the possession of artistic genius. In 1789, after some miscellaneous schooling, he entered the Royal Academy classes, and soon began to make headway. Of his larger pictures may be mentioned *The Sun Rising through Vapour*, *Crossing the Brook*, *Dido Building Carthage*, *The Fighting Téméraire*, and *Calais Pier*. Ruskin, in his *Modern Painters*, wrote with great eloquence and critical insight regarding Turner's work, and brought about a fuller appreciation of his genius. Turner never married, and took little interest in anything outside his art. He left the oil paintings and drawings he had preserved to the National Gallery.

Tussaud, Madame Marie (1760–1850), a Swiss who while practising the art of modelling wax in Paris at the time of the French Revolution, made her escape to England and set up a small exhibition of wax figures in the Strand, later carried on by her son, grandson and great-grandson at Baker Street and in 1884 transferred to Marylebone Road.

Tut-ankh-amen (*circa* 1350 B.C.), an Egyptian Pharaoh of the 18th dynasty, whose tomb was discovered by Howard Carter in 1922, with the mummy and gold sarcophagus intact. The magnificence of the objects found aroused world-wide interest.

Twain Mark. (*See* **Clemens, Samuel L.**)

Tweedsmuir, John Buchan, 1st Baron, C.H. (1875–1940), Gov.-Gen. of Canada 1935–40, journalist, politician, and author, wrote numerous biographies, historical novels, and adventure stories, including *Montrose*, *The Path of the King*, *Greenmantle*, and *Sick-Heart River*, and an autobiography *Memory Hold the Door*. Under the pen name "O. Douglas" his sister, Anna (d. 1948), published some charming tales of domestic life.

Tyler, Wat (d. 1381), the leader of the peasants' revolt of Richard II.'s time against the iniquitous poll-tax. Over 100,000 peasants followed Tyler into London in June 1381, and the king met them in Smithfield and made promises of redress that were never fulfilled. It was at this meeting that Sir William Walworth, Lord Mayor of London, stabbed Tyler with a dagger, and afterwards handed him over to his followers to kill outright.

Tyndale, William (*c.* 1492–1536), was educated at Oxford, and conceived a strong desire to be the medium of presenting the Bible to his country-men in their own language. He completed the translation of the New Testament at Wittenburg, where he was associated with Luther. This version was first published at Antwerp, and then found its way to England, where it was publicly burnt at St. Paul's Cross. Tyndale afterwards was associated with Miles Coverdale in a translation of the Old Testament, but only completed the Pentateuch and the book of Jonah. Antwerp was Tyndale's retreat during this later period, and in 1535 he was arrested for heresy and put to death by strangling and burning.

Tyndall, Prof. John, F.R.S. (1820–93), was an eminent scientist. His books on light, sound, and heat are well-known text-books.

U

Ulanova, Galina (b. 1910), Russian ballet dancer, made her début in 1928 and is the world's greatest living exponent of the art. She danced in Florence in 1951 and in London in 1956.

Undset, Sigrid (1882–1949), Norwegian novelist, daughter of a distinguished Norwegian antiquary, from whom she derived her knowledge of life in ancient and mediaeval Norway. Her first success came with *Jenny* (1911), and the great works based on mediaeval history, *Kristin Lavransdatter* (1920–22) and *Olav Audunsson* (1925–27), won for her the 1928 Nobel Prize for Literature.

Unwin, Sir Raymond (1863–1940), English architect and expert on Town Planning, who became known as the architect of the first garden city at Letchworth, and of the Hampstead Garden Suburb.

Ursula, St., is said to have been an English princess, who with 11,000 virgins set out on a pilgrimage, but compelled by a fierce storm to take refuge in Cologne, was there put to death with her following by an army of Huns.

Usher or Ussher, James (1581–1656), Irish prelate and scholar, one of the most distinguished

theologians of his day. He worked out a system of dates setting the creation at 4004 B.C.

V

Valentine, St., was a Christian martyr of the reign of the Emperor Claudius II (d. 270 A.D.). His festival was commemorated on February 14 before Gregory the Great's time. The custom of sending valentines had its origin in a heathen practice associated with the worship of Juno about this date in the calendar, and had no connection with the saint.

Vanbrugh, Sir John (1664–1726), was a prominent architect as well as a successful dramatist.

Vancouver, George (1758–98), a British navigator who served under Captain Cook and later explored the Gulf of Georgia and the Straits of San Juan de Fuca, as also the shores of Vancouver Island.

Vanderbilt, Cornelius (1794–1877), a noted American merchant and railway speculator who accumulated a fortune of twenty millions sterling. His son William Henry Vanderbilt (1821–85) inherited and added to it.

Van Dyck (or **Vandyke**), **Sir Anthony** (1599–1641), was born at Antwerp, and after studying under Rubens went to Italy and there made a name as a portrait painter. In 1629 he came to England on the invitation of Charles I., but remained only a short time; in 1631 Charles prevailed upon him to return, made him a knight, granted him an annuity, and he became the Society painter of the day.

Vane, Sir Henry (1613–62), was a prominent statesman and diplomatist. At the Restoration he was arrested as an enemy of the State and ultimately beheaded on Tower Hill.

Van Gogh, Vincent (1853–1890), Dutch painter of some of the most colourful pictures ever created. With passionate intensity of feeling he painted without pause whatever he found around him—landscapes, still-lifes, portraits; his was a truly personal art. His life was one of pain, sorrow and often despair and in the end he committed suicide.

Van Loon, Hendrik Willem (1882–1944), Dutch-American historian, born in Rotterdam, who became famous in 1922 with the publication of *The Story of Mankind*, a picture history-book originally intended for children.

Vauban, Marshal Sebastien le Prestre de (1633–1707), a renowned French military engineer who introduced great improvements in methods of fortification, conducted fifty-three sieges, and took part in 140 battles.

Vaughan Williams, Ralph, O.M., M.A., D. Mus. (1872–1958), English composer. After Charterhouse and Cambridge he studied music in Berlin under Max Bruch and, later in Paris, under Ravel. He wrote nine symphonies besides a number of choral and orchestral works including *Sancta Civitas* and *Benedicite*, *Magnificat*, *Four Tudor Portraits*, *Dona Nobis Pacem*, operas including *Hugh the Drover*, *Riders to the Sea*, ballets, chamber music and songs. He showed great interest in folk tunes.

Velasquez, Diego (1465–1523), a Spanish soldier and companion of Columbus, sent to conquer Cuba. Velasquez founded Santiago and Havana.

Velazquez, Diego Rodriguez de Silvay (1599–1660), a famous Spanish painter, whose pictures rank among the finest in Spanish art.

Venizelos, Eleutherios (1864–1936), the Greek patriot and statesman, suffered many vicissitudes of fortune during his career. A Cretan by birth, he became Prime Minister of Greece for the first time in 1910, and again on several subsequent occasions, but died in exile. Best known probably for his activity during the Balkan wars, his finally successful attempts to bring his country into the first world war on the side of the Entente Powers, and his ambitions in Asia Minor. At the post-war conferences in 1919 he exercised more influence than anyone else outside the "Big Four."

Verdi, Giuseppe (1813–1901), Italian composer, foremost figure in 19th-century opera. Early works include *Nabucco*, *Ernani*, *I Due Foscani*, and *Macbeth*. A middle period is represented by *Rigoletto*, *Il Trovatore*, *La Traviata*, *Un Ballo in Maschera*, and *Don Carlo*. To the last and greatest period of his life belong *Aida*, *Otello*, and his last opera *Falstaff*, produced when he was 80. In his 85th year he composed his 'Ave Maria' and 'Stabat Mater.'

Verlaine, Paul (1844–1896), French poet, also well known for his memoirs and confessions; died in great poverty and degradation in Paris.

Vermeer, Jan (1632–75), Dutch painter and the greatest of all the "Little Masters." Jan Vermeer of Delft, as he was frequently referred to, was born in Delft, and obtained considerable recognition in his lifetime, but strangely his existence was entirely overlooked after his death, and until 1860 his paintings were attributed to other Dutch painters. *Lady at the Virginals* is in the National Gallery.

Verne, Jules (1828–1905), was one of the most popular authors of wonder-stories in Europe. The best-known of his numerous works are *Five Weeks in a Balloon*, *Twenty Thousand Leagues Under the Sea*, *Round the World in Eighty Days*.

Vernier, Pierre (1580–1637), inventor of the small sliding scale which enables readings on a graduated scale to be taken to a fraction of a division.

Veronese, Paul, or Paolo Cagliari (1528–88), a celebrated Italian painter of religious subjects His *Marriage Feast at Cana in Galilee*, *The Feast in the House of Simon*, and *The Presentation of the Family of Darius to Alexander*, are paintings of world-wide celebrity, while his *Adoration of the Magi*, in our National Gallery is a grand work.

Veronica, St., a legendary woman of Jerusalem who was said to have handed to Christ her kerchief on His way to Calvary. The old belief was that the Redeemer wiped His brow therewith leaving on the handkerchief a miraculous impression of His face, the so-called "Veronicon." The Saint is commemorated on February 4th.

Verwoerd, Dr. Hendrik Frensch (b. 1901), succeeded J. G. Strydom as Prime Minister of South Africa in 1958. Prof. of Psychology at Stellenbosch Univ., 1928–50.

Vespasian (Titus Flavius Vespasinus) (9–79 A.D.) was Roman Emperor during the last nine years of his life. At one time he commanded the Roman army of occupation in Britain.

Vespucci, Amerigo (1451–1512), Florentine merchant and navigator, who settled in Spain as commercial agent of the house of Medici. He made several voyages across the Atlantic and, according to his own accounts, which are disputed by many authorities, reached the American continent on June 16, 1497. A German geographer paid him the tribute of giving the name America to what is now known as South America in a map he published in 1507.

Victor Emmanuel II. (1820–78) was King of Sardinia from 1849 to 1861, became King of Italy, according the the Proclamation of the Sardinian Senate; but it was not until 1870, when the unification of Italy was fully secured, that the title came to have its true significance.

Victoria (1819–1901), Queen of Great Britain and Ireland and Empress of India, was daughter of the Duke of Kent, and came to the throne in 1837 on the death of her uncle, William IV. In 1840 she married Prince Albert of Saxe-Coburg-Gotha, who died in 1861. Lord Melbourne was Prime Minister at the date of the Queen's accession, and for a number of years the country lived through troublesome times, the Corn Law and Chartist agitations being at times very threatening, but a more settled condition of things supervened, and for the remainder of the long and illustrious Victorian reign there was no serious home unrest. The Jubilee of Queen Victoria's accession was celebrated in 1887, and the Diamond Jubilee 10 years later.

Villeneuvre, Pierre Charles Baptiste Silvestre (1763–1806), the French naval commander who was opposed to Nelson at Trafalgar and captured along with his ship, the *Bucentaure*.

Villon, François (1431–*c.* 1485), French poet who lived at a turbulent time in French history at the close of the Hundred Years War. His extant works consist of *Le Lais* (or *Petit Testament*) and *Grand Testament*, masterpieces of French mediæval verse.

Virgil (Publius Vergilius Maro) (70–19 B.C.), the great Roman epic poet, was born near Mantua, and cultivated a farm in the adjacent village of

Andes. He proceeded to Rome in his thirtieth year to obtain redress for the occupation of his lands by the military. Became known to Octavian and Mæcenas, and, having had his demand satisfied, began the writing of his *Eclogues*. *The Georgics* followed: his most famous work, the *Æneid*, comprised twelve books dealing with the story of the wanderings of Æneas after the destruction of Troy.

Vitus, St., Roman Catholic saint and martyr, who lived in the 4th century. It used to be the custom to dance before his shrine on this festival day, June 15th, in the belief that good health was thereby ensured for the next twelvemonth. The nervous ailment, St. Vitus' dance, derives its name from this practice.

Volta, Alessandro (1745–1827), Italian physicist, professor at Como and Pavia. Working on the results of Galvani, he found that the essential thing in producing an electric current was contact of dissimilar metals. He invented the voltaic pile, the first instrument for producing an electric current, and thereby laid the foundation of electrochemistry.

Voltaire, François-Marie Arouet de (1694–1778), one of the greatest of French philosophers and writers. His first essays offended the authorities, and he lived in London for a couple of years (1726–28), and there wrote some of his dramas. Returning to France he published his *Philosophical Letters*, which aroused the enmity of the priesthood. At this juncture, the Marquise du Châtelet offered him the asylum of her castle of Cirey, and for the next fifteen years he made this his home, writing there his *Discourses on Man*, *Essay on the Morals and Spirit of Nations*, *Age of Louis XIV.*, &c. From 1750–53 he lived in Berlin, on the invitation of Frederick the Great.

Vondel, Joost van den (1587–1679), the greatest of the Dutch poets. Most of his dramas are on biblical subjects, and the two most famous are *Jephtha* and *Lucifer*.

Voroshilov, Marshal of the Soviet Union Klimentiy Efremovich (b. 1881), President of the Supreme Soviet of the U.S.S.R. since Stalin's death in 1953; commander of the Leningrad defences in 1941.

Vyshinsky, Andrei Yanuarievich (1883–1954), Russian jurist and diplomat; conducted the prosecution of the Moscow treason trials, 1936–38; represented Russian interests abroad and at U.N.

W

Wade, George (1668–1748), military engineer who after the Jacobite rebellion of 1715 commanded the royal forces in Scotland and constructed the great military roads through the Highlands, some of which have continued to be the main lines of communication. Promoted to Field-Marshal in 1743 and in 1744 George II made him Commander-in-Chief in England. In the last Jacobite rising of 1745 his army was the first to be evaded by the Young Pretender, Charles Edward, on his famous march south.

Wagner, Richard (1813–83), German composer, born at Leipzig. He achieved a new type of musical expression in his operas by the complete union of music and drama, and his influence on later composers was immense. He made use of the *leitmotif* principle and was his own librettist. His originality and modernism aroused a good deal of opposition, and he was exiled for some years. But he was supported by many loyal friends, including Liszt, the young King Ludwig of Bavaria, and the philosopher Nietzsche. He began the music of the *Ring des Nibelungen* in 1853, finishing it a quarter of a century later. It was not until 1876 that the whole of this great drama (Rheingold, Valkyrie, Siegfried, Götterdämmerung) was performed at Bayreuth under the conductor Hans Richter. Other operas include *The Flying Dutchman*, *Rienzi*, *Tannhäuser*, *Lohengrin*, *Tristan und Isolde*, *Die Meistersinger von Nürnberg*, *Parsifal*, a religious drama. He married Liszt's daughter Cosima, formerly wife of his friend Hans von Bülow.

Waley, Arthur, C.H., C.B.E., M.A. (b. 1889), orientalist, well known for his translations of Chinese and Japanese poetry and prose, being the first to bring the literature of those countries to the western world.

Walker, George (1618–90), the hero of the siege of Londonderry, in 1688, who kept the besiegers at bay for 105 days.

Wallace, Alfred Russel, O.M., F.R.S., LL.D. (1823–1913), celebrated naturalist, a native of Usk, attracted much notice as far back as 1853 by his book *Travels on the Amazon*, detailing experiences in that region. In 1858, while down with illness in the Moluccas, the idea of the evolution theory occurred to him, and curious to say, he drafted his first notes upon it and sent them to Darwin in England while the latter was on the eve of publishing his own exposition of the theory, the result being the reading of a joint paper on the subject to the Linnean Society. The coincidence was fully acknowledged by Darwin. There are differences, however, between the points of view of the two thinkers.

Wallace, Edgar (1875–1932), English novelist and playwright, famous for his detective thrillers. A man of enormous and unflagging energy, he published some 150 crime novels (of which as many as five million were sold in a year) 14 plays, film scenarios, dramatic criticism and a daily racing article.

Wallace, Sir Richard, Bt. (1818–90), son of the Marquis of Hertford, and inheritor from him of a famous collection of pictures and other works of art to which he himself added largely. This was bequeathed to the nation by his widow along with Hertford House and now forms one of the most important exhibitions in London.

Wallace, Sir William (*circa* 1270–1305), the great Scottish patriot and chieftain who led the Scottish armies against Edward I., and for a time the English were kept completely in check. Later, Edward defeated him at Falkirk, and finally in 1304 he was captured, taken to London, condemned for treason, executed at Smithfield.

Wallenstein, Albrecht von (1583–1634), German soldier and statesman during the Thirty Years' War. An able administrator of his own estates, he sought the unity of Germany, but was distrusted and eventually assassinated.

Waller, Edmund (1606–87), was one of the most graceful of English poets, who tuned his lyre to suit both the Cromwellians when they were a power, and Charles II, when his turn came.

Walpole Horace, 4th Earl of Orford (1717–97), younger son of Sir Robert Walpole. He was a member of Parliament from 1741 to 1768, when he retired to his favourite house at Strawberry Hill (" a little Gothic castle ") and devoted himself to the writing of books and the accumulation of works of art. His letters give a graphic picture of Georgian England.

Walpole, Sir Hugh Seymour C.B.E., (1884—1941), a well-known British novelist, whose novels include *Fortitude*, *The Dark Forest*, *Jeremy*, and *Mr. Traill*.

Walpole, Sir Robert, K.G.(**1st Earl of Orford**) (1676-1745), great 18th-century Whig statesman. He sat in the House of Commons for over forty years, and was Prime Minister for the record period of twenty-one years. Although he enriched himself at the public expense, he was a great financial statesman, and his management of the national debt, encouragement of trade and industry, and his mercantilist colonial policy made England materially very prosperous.

Walter, Bruno (b. 1876), a noted conductor of German birth and American citizenship, associated especially with the opera in many different cities.

Walter, John (1776–1847), son of the founder of *The Times* and known as the second John Walter. Was the leading spirit of *The Times* from 1803 to 1847, and it was his efforts that made the journal the greatest newspaper in the world.

Walton, Izaak (1593–1683), one of the most lovable of English writers, the famous author of *The Compleat Angler, or the Contemplative Man's Recreation*. Also published lives of Donne, Hooker and George Herbert.

Walton, Sir William Turner (b. 1902), English composer, whose works include concertos for string instruments, a symphony, and coronation march, *Crown Imperial*, and an oratorio, *Belshazzar's Feast*.

Warbeck, Perkin (1474–99), a Pretender to the English Crown. The son of a Tournai Jew, he claimed to be Richard, Duke of York, supposed to have been murdered in the Tower, and therefore entitled to the throne of England in preference to its then occupant, Henry VII. The Duchess of Burgundy and Charles VIII. of France and James IV. of Scotland gave him their countenance. Warbeck was enabled in 1497 to appear in England at the head of a force of 7,000 men, but was easily defeated, tried for treason and hanged at Tyburn.

Warwick, Richard Neville, Earl of (*circa* 1428–71). "The King Maker," was the leader of the York party in the Wars of the Roses. At the battle of Northampton he made Henry VI. captive, and afterwards proclaimed Edward, Earl of March, king under the title of Edward IV. Then, when Edward showed a disposition to resent Warwick's protection, the latter drove Edward from the country and once more placed Henry VI. on the throne. He lost his life at the battle of Barnet.

Washington, Booker Taliaferro (1858–1915), a famous negro educationist who was Principal of Tuskegee Institute, Alabama, the first and greatest Institute for negro education, from 1881 until his death. He was a tireless worker for a better understanding between negroes and whites. Wrote several books, including his autobiography, *Up from Slavery*.

Washington, George (1732–99), was of English descent, and was living on his American estate at Mount Vernon when the dispute between the British home government and the colonists broke out. He became one of the leaders of the local opposition, and later was elected to the first Congress at Philadelphia. The following year, 1775, saw him Commander-in-Chief of the American army, and from that time to the end of the struggle in 1783 he was trusted and adored by the people, and on the founding of the Republic became its first President in 1789. He served a second term of office from 1793 onwards, and refused election for a third time.

Watson, John Broadus (b. 1878), American psychologist of international fame who formulated the theory known as Behavourism, of which he became the leading exponent. It substantiates the work of the late Professor Pavlov.

Watson-Watt, Sir Robert, F.R.S. (b. 1892), British physicist and engineer, chief of team of scientists engaged in radio location research which resulted in every aircraft and ship being equipped with radar aids enabling them to detect, locate, and shadow enemy craft with great accuracy during the Second World War.

Watt, James, F.R.S., F.R.S.E. (1736–1819). Born at Greenock, this genius was originally a mathematical instrument maker, and being brought into touch with mechanical problems, conceived the idea of the modern, that is, high-pressure steam-engine. Watt took out his first patent in 1769; the engine, however, was used only for mining operations until 1785, when it was applied to a cotton factory, Watt being greatly aided in his developments of the engine by the business ability of his partner, Matthew Boulton.

Watteau, Jean Antoine (1684–1721), a French landscape painter of transcendent ability, and especially great in *genre*. His shepherds and shepherdesses, rustic dance and fête scenes were wonderful for their harmonious brilliancy of coloration. His *chef-d'œuvre* is the *Embarkation for the Isle of Cytherus*, in the Louvre.

Watts, George Frederick, O.M., R.A. (1817–1904), occupied a unique place in English art. His works are numerous; among them may be mentioned *Love and Death*, *Hope* and *The Angel of Death*. He bequeathed to the nation a large number of his finest pictures. His portraits of Swinburne, Carlyle, Cardinal Manning, Browning, and Tennyson are especially fine.

Watts, Isaac (1674–1748), a great English hymn-writer; author of *O God, our help in ages past*.

Watts-Dunton, Walter Theodore (1836–1914), a prominent critic and close friend of Swinburne. Published *The Coming of Love* in 1897, and *Aylwin* in 1898.

Waugh, Evelyn Arthur St. John (b. 1903), English satirical writer, author of *Vile Bodies*, *Scott-King's Modern Europe*, *Brideshead Revisited* and *Life of Edmund Campion*, for which he was awarded the Hawthornden prize in 1936. His brother, **Alec Waugh** (b. 1898), is also a successful writer, the author of *The Loom of Youth*, *So Lovers Dream*, and *His Second War*.

Wavell, Field Marshal Earl, P.C., G.C.B., G.C.S.I., G.C.I.E., C.M.G., M.C. (1883–1950), Viceroy of India 1943–47; Com.-in-Chief India 1941–43; Com.-in-Chief British Forces in Middle East 1939–41; previously Southern Command 1938–39 and of troops in Palestine 1937–39. Described as one of the cleverest generals in the British Army, his strategy against the Italians in the winter campaign of 1940–41 was brilliantly successful.

Webb, Sir Aston, G.C.V.O., C.B., R.A. (1849–1930), President of the Royal Academy, 1919–24, one of our foremost architects, and the designer of the general scheme of the Victoria Memorial in front of Buckingham Palace, the new Birmingham University, the Britannia Naval College at Dartmouth and other fine structures.

Webb, Matthew (1848–83), in 1875 swam the English Channel in twenty-two hours, and was drowned eight years later in an attempt to swim through the Niagara rapids.

Webb, Rt. Hon. Sidney James, O.M. (1859–1947), eminent Socialist, one of the founders of the Fabian Society in 1884. Sec. of State for the Colonies 1929–31, and for the Dominions, 1929–30. Pres. of Board of Trade in first Labour Government, 1924. His wife Beatrice, equally with himself, was a great investigator and writer on political and economic affairs. Among their books were *History of Trade Unionism*, *English Local Government* and *Soviet Communism*. He founded (1913) and edited (till 1922) the *New Statesman*. Raised to the Peerage, 1929, as **Lord Passfield.**

Weber, Carl Maria Friedrich Ernst von (1786–1826), German composer, who is usually looked upon as the founder of the German national opera and of the German romantic movement, which found its complete musical expression in Wagner. His fame rests principally on his three great operas *Der Freischütz*, *Euryanthe*, and *Oberon*, the last being written for Covent Garden. He was an able pianist, conductor, and musical director as well as composer. He died in London after the performance of *Oberon*, and his body was taken back to Dresden in 1844.

Webster, Daniel (1782–1852), an American, who, as statesman, lawyer, and orator, exerted enormous influence on American constitutional ideas and practice. Served twice as Secretary of State and in 1842 negotiated the Ashburton Treaty which settled the Maine–Canada boundary.

Webster, Noah (1758–1843), the American lexicographer and grammarian. Author of the *Dictionary of the English Language*, and works on literary and political themes.

Wedgwood, Josiah, F.R.S. (1730–95), was the most famous of English potters. He was born at Burslem, served an apprenticeship that carried him through all the branches of the trade, and in 1759 was able to set up in business for himself with money he had saved. He persevered through failure after failure, and in a few years produced such an improved form of ware that it came into great demand. He engaged Flaxman to make classical designs for him, and his pottery became the fashion, and led to a great extension of the Staffordshire earthenware industry.

Weill, Kurt (1900–50), German composer of satirical, surrealist operas, including *Die Dreigroschenoper* (librettist Bert Brecht), and musical comedies, including *Lady in the Dark*, and *One Touch of Venus*. He left Germany in 1933 for France and went to the United States in 1935.

Weingartner, Paul Felix von (1863–1942), Austrian conductor and composer, studied at Leipzig and with Liszt. Established himself as a brilliant conductor, held several appointments in Germany, succeeded Mahler at the Vienna State Opera, and became head of the Conservatory of Music at Basle. His compositions include six symphonies, several operas, and some chamber music.

Weismann, August (1834–1914), a distinguished German biologist who was Prof. of Zoology at

Freiburg, 1866–1912. His great work was done in the field of evolution, especially on the question of individual variability. He is particularly remembered for his theory that heredity is a question of the continuity of the germ-plasm and that acquired characteristics cannot be transmitted to descendants.

Weizmann, Chaim, D.Sc., LL.D., Ph.D. (1874–1952), Zionist leader, became provisional President of Israel in May 1948, and was elected first President in 1949. Distinguished microbiologist and organic chemist.

Wellesley, Richard Colley Wellesley, Marquess, K.G., P.C., K.P. (1760–1842) was Pitt's famous governor general of India, the son of the Earl of Mornington, the first professor of music at Trinity College, Dublin, and elder brother of the Duke of Wellington.

Wellington, Arthur Wellesley, 1st Duke of, K.G., P.C., G.C.B. (1769–1852), was the most famous British general of the 19th century. He distinguished himself in India and conducted successfully the Peninsular War. In 1814 he was British Ambassador at Paris. Then came Napoleon's escape from Elba, the short and sharp campaign which terminated at Waterloo, and the final overthrow of Napoleon. Wellington became the most prominent man in the Empire. From 1828 to 1830 he was Prime Minister. From 1842 to his death he was Commander-in-Chief. His funeral at St. Paul's was one of the great pageants of last century.

Wells, Herbert George, D.Sc. London (1866–1946), distinguished English novelist whose work, whether romantic as in *Kipps* and *The History of Mr. Polly*, or scientific as in *The Outline of History*, gained him a world-wide reputation. Social, political and educational problems are treated with breadth of vision and are clearly analysed in his books. Among his later books are *A Short History of Mankind*, *Work, Wealth and Happiness of Mankind*, *The Shape of Things to Come*, *The Fate of Homo Sapiens*.

Wesley, Charles (1708–88), brother of John Wesley, and the poet of Methodism. Wrote a large number of hymns of enduring merit.

Wesley, John (1703–91), the founder of the great religious communion of the people called "Methodists," and the son of a clergyman of the Anglican church. Taking orders himself, in 1735, he went to Georgia as a missioner and allied himself with the Moravians, but later he abandoned all ecclesiastical traditions, and established, on a wonderfully well-devised basis, the connexion called by his name. His own open-air preaching was powerful in the extreme, his energy and depth of purpose inspiring, and his organising ability exceptional. He accomplished a great work of religious revivification, taking the world as his parish; and profound as was his conviction of his high calling as an Evangelist, John Wesley "builded better than he knew" in rearing the denominational edifice which is the monument of his faith and vigour.

West, Rebecca, D.B.E. (Mrs. Cicily I. Andrews) (b. 1892) novelist, critic and journalist. Her critical works include *Henry James*, 1916; *The Strange Necessity*, 1928; and *Particular Graces*, 1933. Among her novels are *The Return of the Soldier*, 1918, *The Judge*, 1922, *Harriet Hume*, 1924, and *The Fountain Overflows*, 1957; *Black Lamb and Grey Falcon* (a travel book and commentary on Yugoslavia) 1942.

Westermarck, Edward Alexander, Ph.D. (1862–1939), a distinguished Finnish scientist who was Professor of Sociology at the University of London, 1907–30. Born at Helsingfors, he made an international reputation with the monumental *History of Human Marriage*, written in English and published in 1891. His *Origin and Development of the Moral Ideas*, 1906–8, was followed by many other works, including *A Short History of Marriage*, 1926; *Ethical Relativity*, 1932; and *The Oedipus Complex* and other essays on sex.

Westinghouse, George (1846–1914), American engineer who built the dynamos for Niagara Falls, and in 1865 invented the compressed air brake known by his name and developed a compressed air system of railway signalling.

Westmacott, Sir Richard, R.A. (1775–1856), a great English sculptor who studied under Canova at Rome, and succeeded Flaxman as Professor at the Royal Academy. He executed many fine monuments in Westminster Abbey, at St. Paul's Cathedral, and elsewhere, including the statue of Achilles in Hyde Park and the pediment of the British Museum.

Wharton, Edith (Jones) (1862–1937), American novelist whose *House of Mirth* (1905) brought her fame as a social satirist. Her work was greatly influenced by her friend Henry James, and most of her fifty-four volumes were written after she was thirty-five.

Whately, Archbishop Richard (1787–1863), was for over thirty years Archbishop of Dublin, and achieved a high reputation as a writer on theology and philosophy. His treatises on *Rhetoric* and *Logic* are among the most notable books of their class.

Wheatstone, Sir Charles, F.R.S. (1802–75), was an eminent English electrician and scientist, whose experiments in association with Mr. W. F. Cooke resulted in the first application in this country of the principle of the electric telegraph. The stereoscope was also one of his inventions. He was Professor of Natural Philosophy to King's College, London, for many years.

Wheeler, Sir Charles, K.C.V.O., C.B.E., P.R.A., F.R.B.S. (b. 1892), British sculptor; P.R.A., 1956.

Whistler, James Abbott McNeill (1834–1903), was an original artist, writer, and wit, who first came to Europe from America in 1857, and made a name as an etcher both in Paris and in London. His studies of Thames scenery are especially fine. When he began to exhibit pictures in oils he greatly puzzled the critics, some of whom discovered in his "nocturnes" and other studies an impressionist of surpassing genius, while others, including Mr. Ruskin, who described one of the "nocturnes" at the Grosvenor Gallery as a "pot of paint flung in the public face," looked upon them as mere audacious eccentricities. The finest of his oil paintings are the portrait of his mother, and that of Carlyle. He brought an action against Ruskin for the criticism referred to, but only obtained a verdict of one farthing damages without costs.

White, Field-Marshal Sir George Stuart, V.C., G.C.B., O.M., G.C.M.G., G.C.I.E., G.C.V.O. (1835–1912), the heroic defender of Ladysmith in the South African War and a soldier who achieved renown at many points of a long military career.

Whitefield, George (1714–70), was for a time associated with John Wesley at Oxford in the propagation of Methodism and attracted great attention by his gifts as a preacher. He was Wesley's most powerful champion; but in 1741, differing from Wesley on a point of doctrine he left the Methodists, and thenceforward simply preached as an evangelist, allying himself with no sect, but expounding Calvinistic doctrines with fervour and eloquence.

Whitgift, John (1530–1604), a gifted Anglican prelate. Persecuted the Puritans, and was one of the authors of the famous *Lambeth Articles*. Was Archbishop of Canterbury 1583–1604.

Whitman, Walt (1819–92) was an original figure in the world of American authorship, and produced many works of striking poetic merit. He served in the Civil War, and his vigorous humanity, as expressed in his writings, made him a distinguished personality. His works include *Leaves of Grass*, *Drum Taps*, and *Democratic Views*.

Whittier, John Greenleaf (1807–92), America's Quaker poet, was the son of a New England farmer, and for a time followed the trade of a shoemaker. After some experience in journalism, he published his first book of poems, *Legends of New England* (1831). His best-known volumes are: *Lays of My Home* (1843), *Voices of Freedom* (1846), *Songs of Labour* (1850), and *National Lyrics* (1865).

Whittington, Richard (*circa* (1358–1423). The son of a Gloucestershire knight who was outlawed. Richard went up to be apprenticed in London and there found fortune and fame eventually as a merchant. Four times Mayor of London and representative of the City in Parliament he was a great man in his time, engaging in many profitable and honourable enterprises. Richard was well styled "the model merchant of the Middle Ages," and he did marry his

master's daughter, and no doubt drew some sort of inspiration from the bells of Bow.

Whittle, Air Commodore Sir Frank, K.B.E., C.B. (b. 1907), pioneer in the field of jet propulsion. The first flights of Gloster jet-propelled aeroplanes with Whittle engine took place in May 1941.

Whymper, Edward, F.R.S.E. (1840–1911), a wood-engraver and artist; also one of the best-known Alpine climbers, and the first to reach the summit of the Matterhorn. Author of books on mountaineering in various countries.

Wiggin, Kate Douglas (Mrs. George C. Riggs) (1856–1923), an American novelist of quaint charm and humour. Author of *Rebecca of Sunnybrook Farm*.

Wilberforce, William (1759–1833), was the son of a Hull merchant. He was educated at Cambridge, and entered Parliament in 1780. In 1789 made the first of his many proposals in the House of Commons for the abolition of the slave trade, but it was not until 1807 that the Act embodying these proposals was carried.

Wilcox, Mrs. Ella Wheeler, a popular American poetess (1855–1919). Writer of sentimental verse.

Wilde, Oscar Fingall O'Flahertie Wills (1856–1900), Irish author and dramatist. The son of Sir William Wilde, a well-known Dublin surgeon, was the leader of the cult of æstheticism, of art for art's sake. His works included poems, fairy-tales and short stories. He is best known, however, for his brilliantly witty comedies, *Lady Windermere's Fan*, *A Woman of No Importance*, *The Ideal Husband* and *The Importance of Being Earnest*.

Wilder, Thornton Niven (b. 1897), American author and playwright. Among his books are *The Bridge of San Luis Rey* and the *Ides of March*.

Wilkes, John (1727–97), was a forcible, daring, and original Whig politician, who championed the cause of the people with great vigour, and was for a time exceedingly popular. For a violent attack on the Government in his paper *The North Briton*, he was committed to the Tower, but obtained release on the ground that he was a member of Parliament. He was later expelled from the House and fled to France, returning in 1768, and elected M.P. for Middlesex. A fresh prosecution, however, and a fresh expulsion took place, and three times he was expelled and as often re-elected. A great agitation ensued, and so high was he in favour among the people, that he was made alderman, then sheriff, then Lord Mayor of London. In the end his opponents gave way, the orders against him were withdrawn, and from 1779 he was Chamberlain of the City of London.

Wilkie, Sir David, R.A. (1785–1841), was an eminent painter of popular subjects, mostly of rural life.

Willcocks, Sir William, K.C.M.G. (1852–1932), a British engineer, born in India, who in 1898 planned the great Aswan Dam, which he completed in 1902. In 1911 he undertook for Turkey a vast scheme for irrigating some 31 million acres in Mesopotamia.

Willett, William (1856–1915), an English builder, noted for his long and tireless advocacy of the Daylight Saving scheme, which, however, he did not live to see put into effect. It was adopted as a war-time measure in the year following his death. (*See* Summer Time, Gen. Inf.)

William I. (1027–87), the "Conqueror," Duke of Normandy, claimed the English throne as legally appointed successor to Edward the Confessor and, at the Battle of Hastings in 1066, defeated Harold II. who was killed. The new king crushed Saxon resistance in the North and West, transferred most of the land to his Norman followers, and drew England into closer relations with the Continent. Maintaining many old institutions such as the shire-court and the fyrd (a non-feudal army), William governed firmly, and was supported by the Church, especially by Lanfranc, Abp. of Canterbury. In 1085 he ordered the Domesday Survey (*q.v.*).

William I. of Prussia (1797–1888), the maker of modern Germany, succeeded to the throne of Prussia in 1861. It fell to him to have the control of his country during a period of mighty transition and development, with Bismarck as his chief minister. The war with Austria rendered him highly popular, and when in 1870 the war with France was entered upon the whole German people rallied round him, and after a series of brilliant achievements by his army he was proclaimed German Emperor on the 18th of January, 1871.

William II. (1056–1100), the Conqueror's son, surnamed "Rufus," King of England from 1087 to his death. Was in constant conflict with his barons, lived a life of wanton pleasure, was oppressive to his subjects, and was shot (by accident or design) while hunting in the New Forest.

William II., the Kaiser (1859–1941), King of Prussia and German Emperor 1888 until he abdicated Nov. 9, 1918, and fled to Holland, where he was subsequently interned in the castle of Doorn, living there in complete retirement until his death in June, 1941. Educated at Cassel and Bonn, afterwards entered the army and took a keen interest in military affairs. Succeeded his father, the Emperor Frederick, in 1888. His reign was marked by a strong militarism and an intense ambition to secure the dominance of Germany in the Councils of Europe —an ambition which by unscrupulous action and utter disregard of treaty obligations brought about the war of 1914–18. To him was due the introduction of a system of war savagery which greatly increased the horrors of warfare and must leave an indelible stain upon his name. Visited England in 1907, was present at King Edward VII's funeral in 1910, and in 1911 at the unveiling of the memorial to Queen Victoria.

William III. (1650–1702), King of England, Scotland, and Ireland (1689–1702), son of William II of Orange (1626–50) and Mary (1631–60), daughter of Charles I. He married Mary, eldest daughter of the Duke of York (later James II) while Stadtholder of Holland. As captain-general of the Dutch forces he was successful against the French, and in 1688, when James had abdicated and fled the country, William was invited to succeed him and he and Mary afterwards became joint King and Queen. Later he was at war with France, and suffered defeats, but ultimately effected an honourable peace by the Treaty of Ryswick in 1697.

William IV of England (1765–1837) was the third son of George III., and ascended the throne in 1830 in succession to his brother, George IV. He had seen some sea service, and was flatteringly styled the "Sailor King." He showed little of kingly capacity, he was genial and pleasure-loving, and placed no obstacles in the way of government, so was, after a sort, popular. In the early part of his reign (1832) the first great Reform Bill was passed.

William the Silent (1533–84), Prince of Orange, made many attempts to secure a peaceful settlement of Netherlands' disputes with Philip II, but became the leader of the ensuing Revolt and was assassinated. He established the independence and Protestant character of the Northern Netherlands, where literary, artistic, colonising, and commercial activity flourished in the following century.

Williams, Sir George (1821–1905), the founder of The Young Men's Christian Association.

Williams, (George) Emlyn (b. 1905), Welsh actor-playwright, and producer, who has had great success in numerous plays and films, and latterly in his readings from Dickens and Dylan Thomas. Author of *Night Must Fall*, *The Corn is Green*, and *The Light of Heart*.

Wilson, Richard, R.A. (1714–82), a landscape and portrait painter. Was the pioneer of modern landscape painting.

Wilson, (Thomas) Woodrow (1856–1924), President of the United States 1913–21. Was Governor of New Jersey, 1912–13. In 1916 secured from the Kaiser a promise to abandon the more inhuman forms of submarine warfare, and, on their resumption in 1917, broke off official relations with Germany and proclaimed a state of war. Entered into the conflict with the utmost vigour, bringing the full military and financial resources of the Republic into play against Germany. Was a great factor in the winning of victory and in the concluding of a just peace. Largely responsible for the setting up of the League of Nations, which was foreshadowed in his famous Fourteen Points.

Wingate, Major-Gen. Orde Charles, D.S.O. (1903–44), was the renowned and daring leader of the Chindit forces engaged behind the Japanese lines in Burma during the second world war. Killed in an air crash.

Winifred, St., the 7th-century patron saint of virgins, a Welsh maiden, who, importuned by Prince Caradoc, treated him with scorn, and he had her beheaded.

Wiseman, Nicholas Patrick Stephen, Cardinal (1802–65), the first R.C. Archbishop of Westminster, created Cardinal. Much of his life was spent in the reorganisation and development of the Roman Catholic Church in Great Britain. He was one of the three great R.C. prelates of the nineteenth century, the other two being Manning and Newman.

Wolf, Friedrich August (1759–1824), a great German scholar, regarded by some as the founder of scientific classical philology.

Wolf, Hugo (1860–1903), Austrian song-writer. In his settings of over 300 German lyrics, including many of Mörike and Goethe, he achieved complete union of poetry and music.

Wolfe, General James (1727–59), commanded the British forces in Canada at the siege of Quebec, where he won a brilliant victory, which cost him his own life.

Wolsey, Cardinal Thomas (1471–1530), was the son of an Ipswich butcher. Showing ability, he was sent to Oxford to be educated, later on entering the Church, where he gradually rose to a position of eminence, and was entrusted with several diplomatic missions. He was especially favoured by the King, Henry VIII., and secured rapid preferment under that monarch, being in turn Bishop of Lincoln, and Archbishop of York. He was subsequently made Cardinal and became Henry's Chancellor. For a number of years he was supreme, and by his diplomacy did much to strengthen the kingly power. But when Wolsey was unable, though willing enough, to obtain the papal sanction for Henry's divorce of Catherine, he fell into disfavour, and his decline was rapid indeed. From being a great personage, with a princely entourage, he was humbled, persecuted, and harried, and died at Leicester Abbey a broken, dejected man.

Wood, Sir Henry Joseph, C.H. (1869–1944), was the most popular English musical conductor of his day. He introduced many works and composers previously unknown to the British public and greatly stimulated and encouraged interest in classical music. His long association with the Promenade Concerts began in 1895 at the Queen's Hall, and after it was destroyed in an air raid in 1941 the concerts continued at the Albert Hall and are now named after him. He composed songs and cantatas, and his arrangement of sea shanties ends every series of Promenade Concerts.

Woodville, Elizabeth (1437–91), wife of Sir John Grey. After her first husband's death she made a secret marriage with Edward IV., and became the mother of Edward V., and his brother Prince, both of whom were put to death in the Tower by order of Richard III. She was also mother to Elizabeth, Queen of Henry VII.

Woolf, Mrs. (Adeline) Virginia (1882–1941), English novelist and essayist, daughter of Sir Leslie Stephen and wife of Leonard Woolf, writer and publisher. Together they formed the Hogarth Press. Among her best known works are *To the Lighthouse*, *Mrs. Dalloway*, *The Waves*, *The Years*, *A Room of One's Own*, *Orlando*.

Woolley, Richard van der Riet, Sc.D., F.R.S. (b. 1906), succeeded Sir Harold Spencer Jones as Astronomer Royal at the Royal Greenwich Observatory in 1956; formerly Commonwealth Astronomer and Director of the Commonwealth Observatory at Canberra.

Wootton, Barbara Frances, Baroness, M.A., L.H.D., J.P. (b. 1897). Prof. of Social Studies, Univ. of London, 1948–52. Her book *Social Science and Social Pathology* (1959) examines the state of our knowledge about social pathology, with particular emphasis on criminology and social work. Created a life peeress in 1958.

Wordsworth, William (1770–1850), the chief of the "Lake Poets," and one of the most inspired of all British bards, was a native of Cockermouth, and was educated at Hawkshead and St. John's College, Cambridge. In association with Coleridge he issued a volume of *Lyrical Ballads* in 1793. The following year saw him settled at Grasmere, and there and at Rydal Mount he passed the rest of his days. In 1802 he married Mary Hutchinson, his cousin, and the two, with the poet's sister Dorothy, formed an ideally poetic household. Here he carried out his creed of "plain living and high thinking," and produced at intervals some of the purest and noblest poetry in the language. As an interpreter of Nature in her many moods he stands unrivalled. Succeeded to the Poet Laureateship on the death of Southey in 1843.

Wotton, William (1666–1727), a scholar of marvellous precocity, who was entered at Cambridge University in his twelfth year, took his B.A. a year later, then knowing twelve languages, and was Fellow of St. John's at nineteen. Wotton became a clergyman of some distinction, and is best remembered as an author by his *Reflections upon Ancient and Modern Literature*.

Wren, Sir Christopher, F.R.S. (1632–1723), the most famous English architect of his time. He did not quite have all his own way with the tremendous thirty-five years' task he accepted in undertaking the reconstruction of St. Paul's after the Fire, but he produced a masterpiece of which Britain may well be proud. Chelsea and Greenwich Hospitals, and a number of London's finest churches were also his work.

Wright, Sir Almroth (Edward), K.C.B., C.B., M.D., F.R.S. (1861–1947), discovered the system of anti-typhoid inoculation, the method of therapeutic inoculation for bacterial infections (vaccinotherapy), and methods of measuring the protective substances in human blood.

Wright, Orville (1871–1948), American airman who, with his brother Wilbur (1867–1912), began gliding experiments on the sand dunes at Kitty Hawk, North Carolina. To the glider they built they added a petrol engine, and on 17th Dec., 1903, they made four flights, the longest being 852 ft. These flights were the first in which a man had been carried from the ground on flight by a power-driven aeroplane.

Wyatt, James, R.A. (1746–1813), a celebrated architect in his day. He built Fonthill Abbey for Beckford and the Royal Military Academy at Woolwich. Pres. of R.A. 1805–6.

Wyatt, Sir Thomas (1503–42), was the first writer of English sonnets, and a poet who did much to develop the earlier forms of verse. He was also a distinguished diplomatist.

Wyatt, Sir Thomas ("The Younger") (*c.* 1520–54); joined with the Duke of Suffolk in favour of Lady Jane Grey and against Queen Mary, son of the last-mentioned. Led the men of Kent in rebellion on London in 1554, but was captured and executed.

Wycherley, William (1640–1715), the Restoration dramatist, was for many years in high favour at Court. His genius for comedy writing was remarkable and readily adapted itself to the Restoration atmosphere; thus while he provided wit and intrigue and plot and characterisation in plenty and of great merit, the taint of the time was over it all. His plays include *The Country Wife*, *Love in a Wood*, and *The Plain Dealer*. He lived recklessly, was generally in pecuniary difficulties, and marrying the Dowager Countess of Drogheda late in life, placed himself in bondage to a highly jealous woman.

Wyclif, John (*c.* 1324–84), born in Yorkshire, educated at Oxford, and one of the most eminent ecclesiastics of his time. He adopted principles many of which became general at the Reformation, and brought down upon himself the bitter enmity of the Roman Catholic leaders, and would probably have been put to death but for the protection of John of Gaunt. While in comparative retirement as Rector of Lutterworth, in Leicestershire, he finished his translation of the Bible.

Wykeham, William of (1324–1404), was Bishop of Winchester from 1366 to his death, and from 1367 to 1371 Lord Chancellor. He was a man of great learning and an excellent preacher, and wielded great influence. He founded New College, Oxford, in 1379 and Winchester College in 1387.

Wyllie, William Lionel, R.A. (1851–1931), an English marine painter who excelled in the

draughtsmanship of seafaring craft of all kinds, and also won a high reputation as a water-colourist and etcher. His picture, *The Thames Below London Bridge*, was bought by the Chantrey Bequest. Among his other well-known works are *The Battle of Trafalgar*, and *The Port of London*.

Wyspianski, Stanislav (1869–1907), great Polish poet, dramatist and painter.

X

Xavier, St. Francis (1506–1552), the apostle of the Indies, was the follower of Ignatius de Loyola, and devoted his life to missionary work in the East. He was canonised in 1622.

Xenophon (444–359 B.C.), the Athenian general and follower of Socrates. His chief works are *Anabasis Hellenica*, and *Cyropœdia*.

Xerxes (*circa* 519–465 B.C.), King of Persia, was the son of the first Darius and a great commander. In 481 B.C. he started on his famous expedition against Greece when, according to Herodotus, he had a combined army and navy of over two and a half million men. He defeated the Spartans at Thermopylae, but his fleet was overcome at Salamis. He reigned from 485 to 465 B.C. and met his death by assassination.

Ximenes de Cismeros, Francisco (1436–1517), Spanish statesman and Cardinal who reformed the Franciscan Order to a great extent, and in 1502 began to direct the preparation of a polyglot bible, the *Complutensian*, which greatly influenced subsequent versions. In 1506 was made Regent for Queen Juana, and raised to the cardinalate in 1507. Personally conducted a military campaign in Africa in 1509, and afterwards became Inquisitor-General, and in 1516, Regent of Castile, but in the following year was dismissed by the Emperor Charles V.

Y

Yeats, William Butler (1865–1939), Irish lyric poet and dramatist and major figure in the Irish literary revival of the 20th century. With Lady Gregory and others founded the Abbey Theatre in Dublin, for which he wrote many plays. Interested in mysticism and the occult. Member of the Irish Senate, 1922–28; awarded Nobel Prize in Literature in 1923. Some of his best work was written in his later years in *The Tower* (1928) and *Last Poems* (1940). Plays include *Cathleen Ni Houlihan* (1902), *The Hour Glass* (1904), *Deidre* (1907).

Yonge, Charlotte Mary (1823–1901), author of over 120 novels, school books, and other works, including *The Heir of Redclyffe*, *The Daisy Chain*, *The Dove in the Eagle's Nest*, and *The History of Christian Names*.

Young, Brigham (1801–77), Mormon leader, and head of the Latter Day Saints of Salt Lake City. At his death he had seventeen wives.

Young, Francis Brett (1884–1954), British novelist. His books include *My Brother Jonathan* and *Doctor Bradley Remembers*.

Young, James, F.R.S. (1811–83), a Glasgow chemist who discovered the method of distilling oil from shale, and founded the mineral oil industry of Scotland, which led to the development of petroleum concerns.

Young, Thomas (1773–1829), one of the most versatile geniuses in history, descended from a Quaker family of Somerset. Studied languages, medicine, and held the Professorship of Physics at the Royal Institution. In 1804 elected Foreign Secretary of the Royal Society. He was very successful in deciphering Egyptian hieroglyphics and was the first to translate the inscription on the Rosetta Stone. Famous for his share in establishing the undulatory theory of light and for his work on physiological optics.

Younghusband, Lt.-Col. Sir Francis Edward, K.C.S.I., K.C.I.E. (1863–1942), soldier, explorer and writer. Wrote many works on the East. Headed the British Mission to Tibet, 1903–04. Was *Times* correspondent with the Chitral expedition. Pres. of Royal Geographical Soc., 1919–22.

Ypres, 1st Earl of, P.C., K.P., G.C.B., O.M., G.C.V.O., K.C.M.G. (1852–1925), entered Navy in 1866, afterwards passing into Army in 1874, making his mark as a Cavalry officer in the Egyptian campaign of 1884; served in South African War with brilliant success. C.-in-C. British Forces in France, 1914–15; C.-in-C. Home Forces, 1915–18; Lord Lieut. of Ireland, 1918–21.

Ysayë, Eugène (1858–1929), Belgian violinist and conductor, noted chiefly for his playing of the works of Bach and César Franck.

Yukawa, Hideki (b. 1907), Japanese physicist, who received the 1949 Nobel Prize for predicting the existence of the meson. Prof. of Physics at Kyoto Univ. since 1939.

Z

Zadkiel (the angel of Jupiter in Jewish rabbinical lore) was the name assumed by **Lilly** (1602–81) the astrologer, and also by **Richard James Morrison** (1794–1874), Hebrew scholar and amateur astronomer, in the almanack known as Zadkiel's Almanack and first issued in 1831.

Zaharoff, Sir Basil, G.C.B., G.B.E. (1849–1936), was an influential Greek banker and financier who became an armaments magnate, supplying the Allies in the first world war.

Zamenhof, Ludwig Lazarus (1859–1917), Polish linguist who was by profession an oculist, but gained fame as the inventor of Esperanto.

Zapotocky, Antonin (b. 1884), Pres. of Czechoslovakia since 1953; Prime Min., 1948–53; formerly trade union official.

Zeno of Citium (*c.* 340–264 B.C.) was a Greek philosopher who founded the Stoic system.

Zeppelin, Ferdinand, Count von (1838–1917), inventor of the huge dirigible airship bearing his name. His first ascent was in 1900. He organised a Zeppelin service for the German army in the war of 1914–18, but their extreme vulnerability militated severely against their usefulness.

Zeromski, Stefan (1864–1925), great Polish novelist, poet and playwright.

Zhukov, Marshal of the Soviet Union Grigory Konstantinovich (b. 1895), led the defence of Moscow and Leningrad during second world war; served on Allied Control Commission in Germany; C.-in-C. Land Forces and Deputy Minister of Armed Forces of Soviet Union, 1946–55; succeeded Marshal Bulganin as Defence Minister, 1955–57.

Zhukovsky, Vasily Andreyevich (1783–1852), Russian poet whose original work had very important influence on Russian literature.

Zola, Emile Edouard Charles Antoine (1840–1902), was the son of an Italian engineer, and came before the public as a novelist in 1867 with *Thérèse Raquin*. He then conceived the idea of a series of novels which should depict the history of a Second Empire family in various realistic phases, and began the series with *La Fortune des Rougons*, in 1871. In 1877 he made a higher success by *L'Assommoir*. From that time every novel he published had an immense sale.

Zorn, Anders Leonhard (1860–1920), was a noted Swedish painter, etcher and sculptor.

Zoroaster, the Greek form of the name of the Persian prophet, Zarathustra, who lived about the seventh century B.C. He was a monotheist, believing in a good and holy God whom he called Ahura Mazda. Many of his teachings were absorbed by the ancient Persian religion which survives today among the Parsees in India.

Zoshchenko, Mikhail (1895–1958), Russian writer whose humorous short stories, satirising the Soviet way of life, were wildly popular throughout Russia in the 1920s. Several have been translated and published in England.

Zosimus (fl. *c.* A.D. 300), the first known alchemist. He lived in Alexandria.

Zuccarelli, Francesco (1702–88), a very celebrated Italian artist, who came to England, succeeded, made a handsome fortune, and was one of the first members of the Royal Academy.

Zwingli, Ulrich (1484–1531), was one of the ablest of the Swiss Reformation leaders.

Zwirner, Ernst Friedrich (1802–61), an eminent Silesian architect. Restored Cologne Cathedral.

A Citizen's Guide

This Section explains how local and central government works and describes recent trends and problems. It tells the story of the British Commonwealth and of the United Nations, traces the growth of European Organisations, explains some of the recent changes in Africa and describes the American Constitution. Four controversial issues of the day have been selected for background study—the younger generation, the Wolfenden Report on homosexuality, capital punishment and world population. The Section concludes with a useful list of voluntary societies.

TABLE OF CONTENTS

A Citizen's Guide

A GUIDE TO LOCAL GOVERNMENT.

What is Local Government?—Local Government is concerned with the domestic duties of a community as distinct from national questions like defence or taxes which must be decided by Central Government. Beyond Central Government innumerable tasks remain for the elected Local Authorities.

The main subjects on which local authorities exercise powers are:—

Allotments.
Approved Schools and Remand Homes.
Art Galleries and Museums.
Baths and Washhouses.
Bridges.
Burial Grounds.
Car Parks.
Cemeteries and Cremation.
Child Care.
Civil Defence.
Community Centres.
Coroners.
Diseases of Animals.
Education.
Entertainment.
Fire Brigades.
Food and Drugs.
Footpaths.
Health Services and Mental Health.
Highways, including cleansing and lighting.
Housing.
Libraries.
Licensing Theatres, Cinemas, etc.
Local taxation—Road Fund and other licensing.
Markets, Abattoirs, and Cold Stores.
Milk and Dairies.
National Parks and Access to the Countryside.
Notification of Diseases.
Parks and Recreation Grounds.
Police.
Rate collection.
Refuse Collection and Disposal.
Registration of Births, Marriages, and Deaths.
Sewage and Sewage Disposal.
Shop Acts.
Small Dwellings Acquisition.
Smallholdings.
Town and Country Planning.
Water Supply.
Weights and Measures.
Welfare.

What Local Government is there in a Village?—Three bodies share the Local Government in a village:—

(1) A Parish Council of between five and fifteen members is elected in all rural parishes where the population is over 300. A Parish Meeting is an assembly of all the Local Government electors of the parish, and it meets every March. Where there are more than 200 electors they may set up a Parish Council; if there are more than 300, they must do so. Where there is no Parish Council the Parish Meeting assembles twice a year.

(2) Second, there is the *Rural District Council* taking in its area a group of adjacent parishes.

(3) Third, there is the *County Council*. The Parish Council deals with the purely local matters we have described. The Rural District Council takes the medium-sized problems like housing and housing conditions and sanitary services. The County Council takes the major services, like education, police, roads.

Value of the General Parish Meeting.—In the great majority of rural parishes little or no use has been made of the General Parish Meeting. But the meeting offers the electors of the parish an opportunity to review all those various matters which closely affect their general welfare. For adequate guidance on this subject enquiry should be made to the National Association of Parish Councils. 26 Bedford Square London. W.C.1. The Secretary, Mr. C. Arnold-Baker is the author of *Parish Administration* (Methuen: 42*s*.), which is a treatise on the administration of rural parishes. It contains a good deal of practical advice and information. It also contains all the relevant Acts of Parliament so that answers can be found to new questions. It is designed for use not only by professional experts but also by the laymen who form the vast majority of the 63,000 Parish Councillors and Parish Clerks.

The Local Government in a Small Town.—Here Local Government is shared by two authorities. the Urban District Council and the County Council, the major services going to the County authority.

The Local Government in a Medium-sized Town.—Here, too, we find only two authorities, the Borough Council and the County Council. The Borough Council is very similar to the urban District Council mentioned in the preceding paragraph, but the chairman of the Borough Council is a Mayor. Not all areas looked after by an Urban District Council are small. There are five with a population of over 100,000. On the other hand, not all areas with a Borough Council are medium sized, many of them having less than 5,000. A town becomes a borough by obtaining a Royal Charter, and the borough becomes a corporate body with a Mayor, Aldermen, and Burgesses (or Citizens).

The Local Government in a Large-sized Town.—In the largest towns there is only one body. The County Council plays no part, and the Local Authority is the County Borough Council. Thus Leicester is a County Borough independent of the Leicestershire County Council. Certain towns have retained their status because of their historic standing, examples being Oxford and Canterbury. There are eighty-three County Borough Councils in England and Wales. A County Borough may also be a City (which is a title of honour conferred upon a town by the Crown), but it may not be. It may have a Lord Mayor, but not necessarily.

The Administrative County.—In England and Wales sixty-two administrative counties, covered by County Councils, have been created. The number exceeds the number of geographical counties because the division for Local Government purposes has been made on grounds of convenience. For example, Sussex is split into the two Administrative Counties of East Sussex and West Sussex.

How Does London Run its Government?—Owing partly to its size and density of population London has its own special form of government. There are no County Borough Councils within the Administrative County of London, and responsibility is divided among the London County Council, the City Corporation, and the Metropolitan Boroughs. The county is divided into twenty-eight metropolitan boroughs, each having a Borough Council. The City of London Corporation is rich in tradition, and it has remained untouched by the general law relating to Local Government. Its functions are small compared to its prestige.

Local Authorities in Scotland.—These consist of County Councils, Burgh Councils, and District Councils. The County Councils have powers and duties similar to those in England and Wales. Burgh Councils are of three kinds (Royal, Parliamentary, and Police Burghs). The Royal Burghs (holding rights directly from the Crown) and Parliamentary Burghs (created by the Reform Act, 1882) correspond generally to County Boroughs in England and Wales, but they are not entirely independent of the County Councils. The Police Burghs correspond generally to the Urban

Districts and Non-county Boroughs in England. The town councils of Burghs consist of Provost, Bailies, and Councillors, corresponding to the Mayor, Aldermen, and Councillors of English Councils. The District Councils broadly correspond to English Rural District Councils. Central control of Scottish Local Authorities is exercised by the Secretary of State for Scotland, the Department of Health for Scotland, the Scottish Education Department, and other Scottish Departments.

Local Authorities in Northern Ireland.—These comprise six Administrative Counties (Antrim, Armagh, Down, Fermanagh, Londonderry, and Tyrone); two County Boroughs (Belfast and Londonderry); three Boroughs; and a number of Urban and Rural Districts.

Who Run Local Government?—We have seen that, excluding the area of the London County Council there are seven different types of local authority:—

Parish Meeting.
Parish Council.
Rural District.
Urban District.
Borough.
County Borough.
County.

Except for the first they consist of representatives elected by the citizens, who ultimately control them. The whole of the members of a Parish Council retire every third year. But in Rural and Urban District Councils and Borough Councils it is the normal practice for one-third of the councillors to retire each year and some continuity of experience is thus assured.

Besides Councillors there is another group of members called Aldermen in Borough Councils, County Borough Councils, and County Councils. They are elected, not by the public but by the Council itself, forming a fixed percentage of the total membership of the Council.

How does Local Government Get its Powers?—A Local Authority may do only those things which it has been empowered to do by Act of Parliament. There are three kinds of such Acts: General, Adoptive, and Local Acts. A General Act may require a Local Authority to do something, or it may permit it to do something if the authority so wishes. Thus Parliament having decided that the minimum school-leaving age is to be fifteen, Local Authorities must see that that rule is carried out: they cannot choose some other school-leaving age. Sometimes the Act lays a duty on the public and requires the Local Authority to see that it is carried out, examples being the Shop Acts fixing hours of shopkeepers.

An Adoptive Act is one which confers power to do something if the Local Authority wish to adopt the provisions of the Act, an example being the Public Libraries Act.

The third kind of Act, the Local Act, confers special powers upon a particular Local Authority to which the Act refers, *e.g.*, the widening of roads, or the establishment of a municipal theatre.

Where does the Money come from?—The services provided by Local Authorities in England and Wales cost about £1,100 million a year; and the main resources are rates and government grants. About £490 million of the money spent by Local Authorities comes from the rates, and nearly £600 million a year is paid by the Exchequer. It has been the practice for the larger part of the Government's share to be paid in the form of specific grants, most of which are calculated on a percentage basis. A percentage grant is one which is made as a fixed percentage of expenditure on some approved object. More than £250 million is paid out for education, as 60 per cent of the agreed cost of the work which is undertaken. Each authority is treated individually. The decision by the Government in 1958 to consolidate twelve of the percentage grants into a general or block grant is dealt with in a later paragraph dealing with the new Act.

How does Central Government Supervise Local Government?—Local Authorities, in providing services (for example, a Police Force) required by Act of Parliament, are in effect carrying out local administration of a national service. Therefore a Government Department is held responsible for seeing that the Local Authorities carry out their local duties. As regards police, the department is the Home Office; for education, the Ministry of Education; for town and country planning, the Ministry of Housing and Local Government. The Ministry of Housing and Local Government has a general concern for Local Government as a whole.

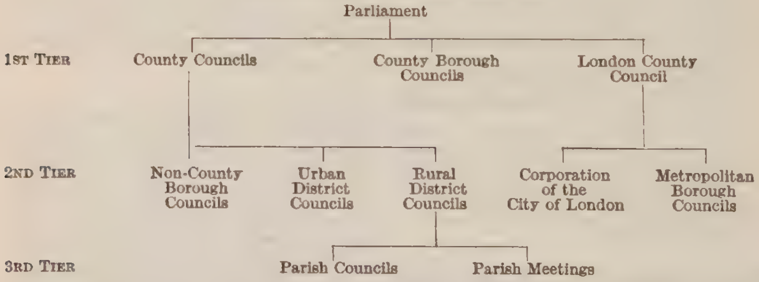
The tendency is for Central Government to lay down broad principles and advice to the Local Authorities, but it is the latter who know local circumstances.

The Trend towards Central Administration.—The country as a whole has taken repsonsibility for running certain services which have been administered locally, or has exercised closer control. Thus hospitals were transferred to Regional Boards under the National Health Service Act. Further examples are the removal of responsibility for trunk roads from local highway authorities and the ownership of civil airfields. Other services which have been transferred from Local Authorities are:—

Gas to Gas Boards.
Electricity to Electricity Boards.
Valuations for rating to Central Government.
River pollution to River Boards.
Outdoor relief of poor to National Assistance Boards.

The Roberts Committee on Public Libraries proposes legislation to ease the transfer of libraries from district to county councils.

Local Government in England and Wales



The Local Government Act 1958.—An attempt at reform was made by the establishment of a Boundary Commission under an Act of 1945. Another attempt at reform was opened in 1956 by the Government's proposal to set up two Local Government Commissions, one for England and one for Wales. Three White Papers were published, the first (1956) dealt with areas and status of Local Authorities, the second (May 1957) with functions of county and district councils, and the third (July 1957) with finance. These proposals were embodied in an Act, the three main objects of which were:—

(1) to increase the financial independence of local authorities by strengthening the rating system and reducing their dependence on percentage grants;
(2) to provide machinery and procedure for reviewing and improving the structure of local government to meet modern conditions;
(3) to give to the larger county district councils a greater share of responsibility for the health, welfare, and education services.

The Main Provisions of the New Act.—To carry out these objects the Act made the following provisions:—

1. Replacement by a general grant of a number of separate grants made for specific services. The largest to be absorbed are those for education, health, fire, and child care.
2. Rerating of industry from 25 per cent. of net annual value (the present level) to 50 per cent.
3. Creation of two Commissions, one for England and one for Wales, to review the areas of counties and county boroughs, and to consider claims for extensions and also claims by large non-county boroughs or urban districts that they ought to be county boroughs. (A population of 100,000 will be regarded as establishing a presumption of adequate size.)
4. Selection of five big provincial conurbations (in England) for special review by the Commission.
5. Reviews of districts and parishes, outside these five areas, by county councils.
6. Delegation of certain health, welfare, and education functions by county councils to the larger district councils.

Reviews of Local Government Areas.—In the White Paper on the Areas and Status of Local Authorities the Government stated that there was "no convincing case for radically reshaping the existing form of local government." What was needed was overhaul and improvements to bring it up to date. The Government considered in particular that—

(1) new or altered machinery was required for reviewing areas and status;
(2) there should be provision for creating county boroughs where appropriate;
(3) the pattern of local government in conurbations (densely populated areas each comprising a large number of authorities) should be examined for better handling of common problems; and
(4) the number of unduly small county districts should be reduced.

County Borough.—At present an essential qualification by a borough seeking promotion to county borough status is that the population of the borough must be at least 75,000. The new Act raised that minimum qualification to 100,000 with certain qualifications.

Special Review Area.—The five "special review areas" which under the 1958 Act are each to be examined as a unit are: West Midlands, Merseyside, West Yorkshire, Tyneside, and South-East Lancashire.

Greater London.—For the time being the Act is suspended as regards Greater London, which is being reviewed by a Royal Commission.

The First Areas to be Reviewed.—The first areas to be reviewed, commencing in March 1959 were the East and West Midlands, and this included the West Midlands Special Review Area. The Local Government Commission announced that their aim, as required by the new Act, was to make local government more effective and convenient. They had power, accordingly, to make far-reaching proposals. They can propose the creation of new county boroughs and the demotion of existing ones, the extension of county boroughs, the amalgamation of counties and alterations of their boundaries. Inside the special review areas they can also propose changes in districts and the creation of a new kind of local-government structure—a "continuous" county with a special distribution of functions. The Commission, later in 1959, announced that they would review next the Tyneside and West Yorkshire Special Review Areas and the south-west of England. At the third stage they would review the north-west of the country, and finally turn to Lincolnshire and East Anglia, the south-eastern and the southern counties.

Royal Commission on the Government of London.—Among those who gave evidence was a group from the London School of Economics. It considered that a more extensive area should have been taken, including the green belt and much of the territory beyond it which was covered by Sir Patrick Abercrombie's Greater London plan. Their main conclusion was that there is an overwhelmingly strong case for a directly elected Greater London Council to perform certain essential functions which demand comprehensive treatment. They also thought that second-tier authorities, within the area of the Greater London Council must be large enough to provide a wide range of services efficiently and economically, and that authorities with populations of less than 300,000 in Inner London and 200,000 in Outer London would be too small. At this point two alternative schemes were proposed.

Second-tier Organisations for Greater London.—Under one proposed scheme the Greater London area would be divided into twenty-five Greater London boroughs with populations of the order of a quarter to half a million. Under the other scheme Greater London would be divided radially into six "London Counties" with populations of the order of a million to a million and three-quarters, with a small Central London authority. Each London county would be subdivided into parishes with populations of 10,000–50,000, whose councils would provide amenities and air grievances.

The Block or General Grant.—The Act of 1958 provided that from April 1959 county and county borough councils should receive a new general grant in place of a number of existing specific grants, including those payable for education, health, fire services, and child care. The level of the grants absorbed was about £300 million, and the grant will be distributed on a formula which takes into account population, number of schoolchildren, old people, density of population, and other factors. About 87½ per cent. of the grants is made up by the old education grant.

The Controversy about the Block Grant and Education.—The principal argument put forward by the Government in favour of the Block Grant was that local councillors would regain initiative which they have lost, since percentage grants mean interference. On the other hand, it was argued that block grants have an inherent tendency to make authorities spend less and that if they do spend less it will inevitably mean less on education. For the Government, Ministers of Education have declared their intention to see to it that education does not suffer. The change was, however,

opposed by the National Union of Teachers, the Association of Education Committees, the education committee of the W.E.A., the T.U.C., and other bodies.

Recent Changes.—At the end of 1959 county district councils with a population of 60,000 or more were entitled to claim delegation from county councils of important planning functions; and in special cases the Minister of Housing and Local Government can require similar delegation to a district council with less than 60,000 population. The principal functions subject to delegation concern applications for planning permission, orders for preserving trees, and the control of outdoor advertising.

The Organisation of the Police Force.—In 1959, after two or three cases which had disturbed public opinion, the Home Secretary ordered an inquiry into the recruitment and organisation of the police force and the relations between the police and Government, and between police and public. The existing organisation of police forces is complicated. The 126 police forces in England and Wales are:—

1. County forces, under a Joint Standing Committee (half the members from the county council and half Justices of the Peace).
2. Borough forces, under Watch Committees, elected by the borough councils.
3. Combined forces covering more than one county or borough, under a body representing the constituent areas.
4. The Metropolitan Police Force, covering a 15-mile radius from Charing Cross, under the control of the Home Secretary.
5. The City of London force, under a committee of the Common Council.

Entertainments and Museums.—It is not widely known that since 1948 certain Local Authorities are empowered to take steps for the provision of a theatre, concert hall, dance hall, and other premises suitable for giving entertainment. Outside London the Local Authorities so empowered are County Boroughs and County Districts. Their expenditure for the provision of entertainment, which includes maintaining a band or orchestra, is limited to the product of a sixpenny rate, plus receipts from charge for admission, etc. Much better use needs to be made of this power if the low cultural quality of life in provincial cities is to be raised. Another element in cultural life which needs encouragement is the provision of museums. The value of a museum as a stimulus to general interest and education is only being slowly realised, and a large number of towns are devoid of anything in the nature of a museum. But both urban and rural authorities are free to establish museums and maintain them. Although museums add the name of the county to their title, scarcely any County Council supports a museum.

County Archive Offices.—Up to a fairly recent date county archives were neglected save for the care devoted to them by private societies or individuals. Counties have now been invited to institute a County Archives Institute. Where this has been done, invaluable historical records, which were rapidly disappearing, have received the care which they deserve to have in any good community.

New Towns.—A change in the government of the new towns was made by the New Towns Act, 1959. Under that Act when the New Towns Development Corporations are wound up their assets and liabilities will be transferred to a new body, to be known as the Commission of the New Towns, instead of to the Local Authorities as stipulated in an Act of 1946. The Local Authorities will remain responsible for schools, roads, lighting, and refuse disposal, but the Commission may assist in providing amenities, water supply, and sewerage. The Commission's houses will be exempt from rent control.

The Professions in Local Government.—A new trend in local government is that the work of the professional person is becoming more important, in some people's eyes, than that of the politician or councillor. The work of local government is largely planned and operated by doctors, engineers, lawyers, teachers, and so on. Another trend is the introduction into local government of the managerial methods of business (known as O. & M., Organisation and Method) already introduced into Government Departments and public corporations. Will these methods tend, by their emphasis on financial efficiency, to lead to the creation of bigger authorities?

A Vision of Community.—What, if anything, is likely to infuse new life into local government, which has played so important a part in English life? Will local bodies be able to play a new, imaginative rôle as community builders, providing finer opportunities of life in the community—making the arts accessible to larger ranges of people, and housing them handsomely? In modern society human relations within the family have been stimulated by the building society, the motor-car, the television, and domestic machinery. The Press, the radio, and television deal with national and world events. In this pattern, local public life is neglected. But the decay in local initiative and in a sense of community is extremely serious.

The International Municipal Exchange Scheme.—The Council of Europe had devised a scheme to promote exchanges between county and borough councillors and local-government officers throughout Europe. It enables those responsible for local government to broaden their knowledge of the institutions and administrative methods of other countries. A Yearbook on the subject is issued by the Council of Europe, Strasbourg, France. The councillor or local-government official desirous of visiting a given municipality writes to the Mayor and receives the name and address of his host. The opposite number in the foreign country undertakes to explain to his guests the local administrative methods and to make their stay profitable. The Council also hold, from time to time, a European Conference of Local Authorities, at which delegates attend representing, not Parliaments, but municipal authorities.

OUTLINE OF CENTRAL GOVERNMENT.

What is Democracy?—Democracy is a form of Government in which the supreme powers of Government are vested in the whole body of citizens. It thus differs from an autocracy, in which these powers are vested in one person, from an oligarchy (powers vested in a few people), and from an aristocracy (powers vested in a privileged class). This country, the United States, the Scandinavian countries, and most of the Dominions are among the examples of a democracy. The classification of Governments into monarchy (a form of government with a King or Queen at the head) and republic (which has no King or Queen but a President) cuts across the division of Governments into those which are democratic and those which are not. For example, the United States is a democracy, but not a monarchy. In this Guide we try to explain how democracy works in Great Britain; the essential methods whereby the people control the Government; and the way Government itself works (including Parliament, the Civil Service, Local Government, and the Judiciary).

Essentials of Democracy.—The fundamental way in which the mass of citizens control the Government is a combination of methods, namely universal suffrage, the rule of the majority, and the right to oppose the Government. Under the first of these three principles all citizens, male or female, over the age of twenty-one have the right to elect their own member of Parliament and to vote in local elections. Although we may sometimes take universal suffrage for granted, it came

only in 1928, and is the culmination of slow growth. Under the second principle the majority has the right to rule, subject to the safeguards we shall describe later and subject especially—and this is the third principle—to the right of the minority to oppose. This consideration is vital to a democracy and opposition is so essentially a part of the British Constitution that the Leader of the Opposition is paid a salary by the Government. The idea of opposition entails the existence of parties, dealt with later.

What is the British Constitution?—The statement that our Constitution is an unwritten one means that there is no single document called a Constitution. In this respect this country is unique. Democracy is preserved by the ordinary law, by the political organisation of the people, by custom, and by rights which depend upon the capacity of the people to preserve them.

Government of the People.—The supreme law-making body is Parliament (a word which originally meant a talk). Parliament has grown from the original principle that in important matters such as making the laws the monarch ought not to act without counsel and consent, and it now consists of two Houses, the House of Lords, composed of lords spiritual and temporal, and the House of Commons representing the commoners.

House of Commons.—The principal share of parliamentary business is conducted in the Commons. Its business is divided into three branches: legislative, financial, and critical.

Composition of the House of Commons.—Its members consist of 630 citizens of the United Kingdom and Northern Ireland, who receive a salary. Women are eligible for membership. Adult citizens of both sexes have the right to vote at general elections subject to certain qualifications. The Speaker or chairman is elected by a free vote of the House from among the members. As Speaker he presides over debates with impartiality and safeguards the rights of members. He is the link between the House and the Crown. The life of a Parliament is limited to five years, although, on the advice of the Prime Minister, the Queen may dissolve Parliament and issue a proclamation calling for election of a new Parliament. Parliament is adjourned from day to day while in session. At the end of the session it is prorogued. At the expiry of its life it is dissolved.

Legislation.—Legislation is the work of making laws. The law of this country consists of common law, statute law, and equity. One may describe the common law as that based on custom and usage as declared and expounded by judges. Statute law is the law made by Parliament, enshrined in Acts of Parliament or statutes of the realm. Parliament is thus concerned with the making of statute law. The classification of law is explained in another part of this section and in the Section **The Law of England.**

How Laws are Made.—Any member of the House of Commons may present a Bill after giving formal notice, but the principal Bills are those introduced by the Government based upon its programme as outlined in the Queen's Speech. The Bill has to pass three Readings before it is agreed by the Commons. The First Reading is a formality. The House gets down to discussion at the Second Reading, when general principles as distinct from details are discussed. If these principles are approved, the Bill passes its Second Reading and is then referred to a Committee. This Committee is a Committee of the whole House, with the Chairman of Committees presiding in place of the Speaker (a proceeding adopted for the more important Bills) or it may be a Committee composed of a lesser number of members divided between the parties on relative strength in the House itself. Finance Bills and other money Bills go to a committee of the whole House. In Committee the Bill is examined clause by clause. After the committee stage follows the report stage. The House (with the Speaker) considers the Bill as reported to it by the Committee and considers whether further changes should be made. Where the House reports to itself this stage is a formality. The final stage in the Commons is the Third Reading (when only verbal alterations are allowed) and the House considers the Bill as a whole and whether it should or should not become law. The Bill, having passed through all its stages in the House of Commons, is sent to the Lords, who may reject or amend it. The Lords cannot require the Commons to agree to amendments; nor can they delay a Bill indefinitely. They have no power in respect of money bills or bills dealing with the duration of Parliament; and since the passing of the Parliament Act, 1949, any other Bill which has been passed by the House of Commons in two successive sessions may be presented for Royal Assent without the consent of the Lords, provided that a year has elapsed between the date of the Second Reading of the Bill in the Commons and the date on which it is finally passed in that House.

Money Functions of the Commons.—We return to the Commons and its second function (and one of its earliest in history) to provide the State with money. The Government cannot raise money by taxation (or in any other way) or spend money without the authority of Parliament; and this power of authority belongs exclusively to the Commons. The House can vote money only on the demand and on the responsibility of a minister of the Crown.

Critical Functions of the Commons.—Parliament itself does not govern. The Queen's ministers are responsible for government and parliamentary government means that Parliament ensures that those ministers represent and have the confidence of the party which possesses a majority in the House; and further, that it controls the action of ministers by questions and criticisms. Any member may propose a motion of condemnation of any member or department of the Government, and such a motion would become a vote of want of confidence if it were made by the leader of the opposition.

The House of Lords is the oldest second chamber in the world and the most hereditary in its character. The Lord High Chancellor presides. The House of Lords has two sets of functions, legislative and judicial. It is a party to legislation within the limits imposed by the Parliament Acts of 1911 and 1949, and these limits are explained above. They are based on the fundamental principle that the function of the Lords, which is a non-representative assembly, is not to thwart the will of the people, but to ensure that that will is precisely and reasonably interpreted. The judicial functions of the House of Lords sprang from the fact that it is the highest Court of Appeal for the United Kingdom. Only the nine Law Lords and those peers who have held judicial appointments hear these appeals, which are presided over by the Lord Chancellor. These decisions are final and become part of Common Law. Proposals for reform of the House of Lords are discussed in a later paragraph.

A Separate House of Lords for Scotland.—In 1960 the independent Bow Group of the Conservative Party suggested a separate House of Lords for Scotland to give that country an Assembly where Scottish views could be aired. Five years earlier the Royal Commission on Scottish Affairs had considered—but rejected—the idea that the Scottish Standing Committee of the House of Commons should sit in Edinburgh instead of London. The Committee, however, can scarcely be regarded as a vigorous one.

The Queen.—We have seen that the Central Government is vested in the High Court of Parliament or The Queen in Parliament, consist-

ing of the Queen and the two Houses. The Queen's tenure of the Crown holds for life (unless she abdicates), it is hereditary, and it is held by statutory right. The Queen is a constitutional monarch; she takes an oath at her Coronation to rule according to the laws and customs of the people. She is the link binding the United Kingdom with the independent countries of the Commonwealth (where she is represented by a resident Governor-General). The Queen is the fount of honour and justice in the realm. She is head of the Forces, which are governed by "Queen's Regulations." She is also head of the Executive, that is all the work of the State is enacted in the name and under the authority of the Crown. Her assent is necessary before a Bill becomes an Act of Parliament.

The Parties.—We have said that the right of a minority to oppose is an essential of democracy, and this idea means that political parties are allowed to function. The party system implies a government party (which has the largest number of candidates) and an opposition known as Her Majesty's Opposition (the leader of which receives a salary). The party system emerged in the latter half of the seventeenth century as Parliament gained the right to be the law-making body. The original division was between Tories and Whigs, the former representing broadly country interests and emerging from the Cavaliers and the latter broadly representing new interests and having their origin in the Roundheads. Thus of the three main political parties today, we may say that the Conservative Party's line of growth is from Cavalier to Tory, to Unionist and to Conservative; the Liberal Party's growth is from Roundhead to Whig and now Liberal; while the Labour Party is the youngest of the three. The Conservative Party advocates private ownership of land and the means of life and is inclined to take a cautious attitude to reform. The Liberal Party strongly advocates free trade and also supports private enterprise, but initiates and supports reform. The Labour Party distrusts exclusive reliance upon private enterprise and looks to State action or nationalisation to bring about a better distribution of wealth.

The Executive.—We must now turn from law-making by Parliament to the carrying out of the law. The work of applying the law and securing obedience is called the executive work of the Government. The Executive comprises five bodies; the Queen, the Privy Council, the Cabinet, the Government Departments or Departments of State and the Civil Service. The Queen as the Head of the State is the nominal head of the executive.

The Privy Council is the Queen's own Council, consisting of over 300 distinguished men drawn from all walks of life. Its function is to give private advice to the Queen. From it have sprung many organs of the constitution. For example, the Judiciary or courts of justice have grown from the Queen's Council sitting as a Court of Justice, and today the Judicial Committee of the Privy Council is a body of distinguished lawyers acting as a Court of Appeal from courts of the Commonwealth. Many of our Government Departments have grown from Committees of the Privy Council.

The Cabinet was originally a committee of the Privy Council. It consists of the principal Ministers of the Crown, and is responsible for deciding the policy of the Government on all matters affecting the country, whether on foreign or home affairs. It has also complete control of the Government Departments. It is thus the central link in the whole machine of government. The Cabinet is responsible for the individual actions of its members. This follows from the requirement that a Minister's policy must be in agreement with Cabinet policy. Thus the Government have a common policy and act as one man. This is the meaning of the phrase "Ministerial responsibility."

The Prime Minister.—The office of Prime Minister, like the existence of the Cabinet, was not formally mentioned in law until recent times. He is the link between Cabinet and Queen. It is he who decides when to advise the Queen to dissolve Parliament. He is leader of the Government party in the House of Commons and gives a lead on policy. A recent writer has pointed out how he Constitution has, after long evolution, divided the functions of leadership and vested them in two personages—a Prime Minister who is temporary and removable by the will of the electorate, and the Queen, who, by contrast, embodies the principle of continuity. In recent years the office of Prime Minister has steadily increased in importance, and the holder bears a growing resemblance to the President of the United States.

The Government Departments.—The Departments are divided into six groups; the Defence Services, the Taxing Departments, the Social Services, the Post Office, Productive Departments, and others.

Defence Services and their Supply.—These consist of the *Admiralty*, the *War Office*, the *Air Ministry*, the *Ministry of Defence*, and the *Ministry of Aviation*.

The Taxing Departments consists of the *Inland Revenue*, which assesses and collects Income Tax, and the *Customs and Excise*, which collects taxes on certain goods when imported into this country and certain commodities produced in this country (*e.g.*, beer, liquors), and taxes certain transactions (*e.g.*, purchase tax) or activities (entertainment tax).

The Social Services.—Into this important group we may put the following:—

National Assistance Board conducts the administration of national assistance and non-contributory old-age pensions.

Ministry of Pensions and National Insurance operates pensions for death or disablement in war (including civilians) and the care of disabled and war orphans; and it also operates the National Insurance Acts and Family Allowances.

Ministry of Labour and National Service operates the Employment Exchange, the Appointments Department, Unemployment Insurance, Resettlement, Training of the Disabled, Factory Inspection, and Training Centres.

Ministry of Education.

Ministry of Housing and Local Government deals with housing and new towns, planning and control of the use of land.

Ministry of Health administers the National Health Service.

The Post Office employs more staff than any other department, and works the posts, telegraphs, telephones, and the Savings Bank. Through its 20,000 Post Offices it does a large number of tasks, such as paying out pensions and family allowances, and issuing wireless and television licences.

Productive Departments.—A number of other Departments produce essential and useful products, for example the *Ministry of Works*, which supplies building material.

Other Departments.—There still remains some forty or more other Departments. The most important offices are:—

Treasury controls national finance and manages the Civil Service.

Foreign Office.

Ministry of Agriculture, Fisheries and Food.

Colonial Office manages relations with Colonies, protectorates, protected states, and trusted territories.

Commonwealth Relations Office deals with

affairs relating to self-governing member countries of the Commonwealth and with the Central African Federation.

Ministry of Power.

Home Office, responsible for Police, Prisons, Aliens, Children, National Fire Service, etc.

Board of Trade.

Ministry of Transport.

Ministry of Aviation.—Aviation was given its own Ministry by the new Conservative Government in 1959. It took most of the functions of the Ministry of Supply (which was abolished), and these functions included guided-missile research. The civil-aviation functions were taken from the Ministry of Transport, which was thus left to concentrate on a roads programme.

A Minister of Science and Technology.—One of the changes introduced by the Conservative Government in the autumn of 1959 was the assignment of responsibility for science to the Lord Privy Seal. That Minister became in fact, though not formally in name, Minister of Science and Technology. This responsibility includes atomic energy. Hitherto civil science had been run by two offices—one under the Lord President of the Council and the other, the Atomic Energy Office, under the Prime Minister and deputed to the Paymaster General. The two offices were combined under the Lord Privy Seal, and an Atomic Energy Office ceased to exist as such.

Possible Amalgamation of Colonial Office and Commonwealth Relations Office.—These two offices were formed out of the Colonial Office in 1925. But the field of the Colonial Office is rapidly shrinking and that of the C.R.O. correspondingly grows as countries in the Commonwealth emerge into self-government. It is seen, however, that countries do not change their natures and needs so rapidly as their formal status, and continue for some time to look to Whitehall for many services they previously enjoyed as Colonies. It is, therefore, being urged that it might soon be time to reunite the two Departments with a three-fold function; a diplomatic one (now the C.R.O.'s) for full Commonwealth members; an administrative one (now the Colonial Office's) for the dependencies; and a technical and advisory service available to countries of any standing.

The Civil Service consists of all employees in the Government Departments. They are employed by "The Crown," and their salaries are authorised annually by Parliament. The employees of Public Corporations (like the National Coal Board) are not Civil Servants, nor are those employed by Local Authorities. The Civil Service (leaving out the postal workers) is divided broadly into five classes: the Administrative; the Executive; the Professional, Scientific, and Technical; the Clerical; and the Messengers, Cleaners, etc.

Changes in the Scope of Government.—During the present century the field in which the Government operates has widened considerably. Fifty years ago the Government was concerned mainly with the maintenance of order, external defence, and foreign relations. Now it is directly concerned in economic affairs, participating in industry and commerce, organising development and investment, and promoting scientific research. A good deal of the State's activities is conducted through public corporations. The increasing impact of science has been reflected in the organisation and promotion of research by the Government. The much wider sphere of Government activity has resulted in there being six times more non-industrial Civil Servants than in 1914, and three times more than in 1935. These figures exclude the Post Office.

The Grievance Man: a Novel Scandinavian Device.—A method of dealing with miscarriage of justice as between private individuals and Government Departments has been in practice in Sweden for a long time. A Parliamentary Commissioner watches over both military and civil affairs. More recently the system has been adopted by Finland and Denmark and it is due to be incorporated in the Norwegian Constitution. The Danish "Grievance Man" is elected by Parliament to investigate complaints; and in so doing he has access to hospitals, mental homes, barracks, and prisons. Every person in Government service (including Ministers) is obliged to supply him with any documents or information for which he asks. He cannot, of course, reverse a Government Department order, but he can recommend to Parliament that a minister should be called to account. In 1958 the all-party organisation of lawyers, known as "Justice," began an examination as to how far the Scandinavian experience can be applied in this country.

Election Results from 1900 to 1959 have been:—

	Cons. & supporters.	Lib.	Lab.	Irish	Others
1900	402	184	2	82	—
1906	157	379	51	83	—
1910 (Jan.)	273	275	40	82	—
1910 (Dec.)	272	272	42	84	—
1918	526	28	63	73	17
1922	347	118	142	—	8
1923	261	155	191	—	8
1924	413	40	151	—	11
1929	260	59	287	—	9
1931	521	37	52	—	5
1935	431	21	158	—	5
1945	212	12	398	—	18
1950	298	9	315	—	3
1951	321	6	295	—	3
1955	344	6	277	—	3
1959	365	6	258	—	1

Some Anomalies of the 1959 General Election Results.—The Conservatives polled more votes than in 1955, but fewer in relation to the increased total of votes cast. In 1955 the Government got the support of 49·8 per cent. of the voters, and it had a majority of 60 seats in the House of Commons; in 1959 they received 49·4 per cent. of the votes, but the majority rose to 100 seats. Allowing for that portion of Liberals, Nationalists, etc., who would prefer Conservative to Labour, the Government's support cannot amount to substantially more than half the nation. Yet, under our electoral system, it has a majority so large as to enable it to disregard the wishes of the other half. To elect one Member of Parliament it took 37,693 Conservative votes, or 47,349 Labour votes, or 271,627 Liberal votes. In other words, the average Conservative vote at the 1959 election was worth more than a Labour vote and nearly eight times as much as a Liberal vote. There were 80 members elected with fewer votes than were cast for their two or more opponents (47 Conservatives, 31 Labour, and 2 Liberal). Thus 80 constituencies are represented by someone who the majority may have wished to keep out.

An Analysis of Three Groups of Seats.—It is worth examining what happened in certain groups of constituencies. The result in Bedfordshire County, where there are four separate constituencies, was:—

Conservatives	97,000 votes	4 seats
Labour 76,091 votes	98,068 "	0 seats
Liberal 21,977 votes		0 seats

A still more curious result occurred in Cardiff:—

Conservative	77,042 votes	1 seat
Labour	70,359 votes	2 seats
Others	2,961 votes	0 seats

At Leicester City four Conservative candidates polled 80,774 votes, but only one got in, whereas

three out of the four Labour candidates were successful on total votes of 72,091. There were, of course, similar anomalies elsewhere.

The Case for Electoral Reform.—Of the nearly 28 million votes cast, nearly 12 million were cast for losing candidates. All those 12 million voters had no influence on the composition of the House of Commons. The object of the proposed system called Proportional Representation is to make votes count.

Proportional Representation.—So long as only one member of Parliament is elected at a time, only one body of opinion in each constituency can be represented. Suppose, however, several Members of Parliament were elected together, say the four members for Bedfordshire or the three for a city like Cardiff, the elector could vote by numbering the candidates—1 for the man or woman he thinks the best, 2 for the next best, and so on as far as he pleases. Your vote is thus made to count by being passed on from a candidate it cannot elect to one whom it can elect—exactly as, in a shop, if the thing you want is out of stock, you spend your money instead on the next best thing. If the candidate you have marked "1" has so many votes that he does not need yours, or if he has so few votes that he has no chance of election the Returning Officer passes your vote on to the candidate you have marked "2" and further, if necessary, till it reaches a candidate whom it can help to elect. As, in this way, nearly all the votes are made effective, it follows that the Parliament thus elected must reflect the wishes of nearly all the voters. This is the system of Proportional Representation by the Single Transferable Vote. The Proportional Representation Society, 82 Victoria Street, London, S.W.1, publish explanatory pamphlets on the subject, including details of a model P.R. election, illustrating, exactly, how the single transferable vote works.

Proportional Representation in Other Countries.—Eire, Switzerland, Sweden, and some other countries have used Proportional Representation for more than a generation. They all have stable Governments. P.R. does not necessarily produce coalitions, but it does make them easier to form and to work, if circumstances require. An objection to coalitions under the present British voting system disappears, because there is no need for pacts between the parties in the constituencies. After the election, a coalition can be entered into freely, on the basis of whatever common ground exists between the parties, with public support for the various parties and policies accurately known and represented.

Reform of the House of Lords.—A controversy between the two Houses arose during 1947–48 when it was agreed, on the initiative of the Conservative Opposition, to set up an inter-party Conference to consider whether agreement could not be reached on the future of the House of Lords. The party leaders did agree provisionally on certain proposals. They agreed that the existing constitution of the House of Lords should be modified to ensure that the Second Chamber was complementary to and not a rival of the House of Commons and that there should be no permanent majority for any one political party. On the composition of the new House it was agreed that:—

1. The present hereditary peers would not automatically be qualified to attend and vote.
2. Instead new "Lords of Parliament" would be appointed on grounds of personal distinction or public service. They would be drawn either from the hereditary Peers or commoners who would be created Life Peers. They would be paid and would be disqualified if they neglected or became unable or unfitted to perform their duties.
3. Women should be eligible to take their place in the Lords.
4. Peers who were not Lords of Parliament would be able to vote at elections and be candidates for the House of Commons.

But the Conference broke down on a point on which agreement could not be reached. It concerned the powers which should be vested in any reformed Upper House, and in particular the length of time that would be reasonable for the performance of its functions. A proposal for another informal Conference on the subject was made in 1953, but came to nothing.

The Life Peerages Act, 1958 was the first attempt to fulfil the promise of reform contained in the preamble of the Parliament Act, 1911. The Act provided for the creation of life peers and the introduction of women into the Lords. The first list of life peers in July 1958 comprised four baronesses—the first women members of the House of Lords—and ten barons.

The Privy Council as Second Chamber.—A proposal that the functions of the House of Lords should be taken over by the Privy Council was made by Mr. Anthony Wedgwood Benn in 1957. He thought there was a strong case for a Second Chamber to help the House of Commons, which would otherwise be burdened with work; but he rejected the possibility that a reformed House of Lords might serve this purpose. He advocated that a Second Chamber should be by appointment in preference to any form of direct or indirect election and he argued that the Privy Council fulfils all the conditions required of the Second Chamber.

The Reform of the Commons.—As a result of the 1959 Election it was realised that the old idea of British politics whereby there was a fairly regular swing of the pendulum might be replaced by another—long periods of one-party Government during which a Ministry (backed by the power which the Constitution gives the Executive and by an efficient Civil Service) might rule unchallenged and scarcely criticised. It became vital therefore to revitalise Parliament for its proper rôle as a check to the Executive. Such a process would also give opportunities to Members to give their best abilities to serving the public.

The Proposal for Specialised Standing Committees.—Small committees on special subjects, such as colonial affairs, which would do much of the work now done by committees of the whole House, would enable back benchers to become acknowledged authorities with real influence. This system is a feature of the United States Congress, and is said to be foreign to our system and likely to weaken the power of the Executive. But it is more powerfully urged that such a reform would make the Commons a much more informed and effective critic of Government policy and administration, and that it would encourage a Member of ability to feel that he could serve the country even if he never became a Minister. A number of standing committees sitting simultaneously would enable Parliament to get through business more quickly and thus find more time to debate great issues of defence, foreign affairs, and economics.

Proposals for a More Efficient Commons.—Among further proposals made were:—

1. M.P.s should be given individual offices, secretaries, free travel anywhere on public business, and a salary and pension scheme tied to a Civil Service grade.
2. M.P.s should have good research facilities, thus having sources of information independent of Whitehall.
3. M.P.s with these facilities should put their public duties before all other concerns and be more available to investigate complaints against the Executive and other public authorities.
4. A strong case can be made out for secret voting so that members might vote without fear or risk of expulsion from party and thus from Parliament.
5. Voting to take place only upon important issues; on other matters the dissent of minorities could be recorded.

The Vote at Eighteen?—There appears to have been no inquiry into the general question of the age at which men and women ought for general purposes to be regarded as adult. At what age ought they have the right to vote? At 18 they are liable to compulsory military service. At 18 they pay adult rates of National Insurance, they may bet and drink intoxicants in public-houses, they may drive a car or be in sole control of an aircraft. They are liable to taxation as soon as work begins; and they are treated by the Courts as an adult from 16 years and upwards. They can marry at 16. The question has therefore been asked whether the State, having imposed so many obligations and rights upon young people at the age of eighteen, should not give them the right to vote at that age and not withhold it for another three years. If they are fit to fight for their country are they not also fit to vote? This question is strengthened by the further reflection that if young people were enfranchised the needs of youth would receive more attention and the community would be enriched by their vigour.

LAW AND THE COURTS.

The subject of English law and its sources (comprising Common Law, Case Law, Equity, and Statute Law) is dealt with in the section **The Law of England.**

The System of English Courts.

I. Criminal Courts.—1. *Courts of Petty Sessions.*—At the bottom of the ladder are the Courts of Petty Sessions, which can try minor offences punishable either by fine or imprisonment, with a maximum of six months' imprisonment for one offence and twelve months for two or more. These courts are presided over by not fewer than two local Magistrates, called Justices of the Peace, whose office is honorary, and who are appointed by the Lord Chancellor on the recommendation of the Lord Lieutenant of the County. Some officials, *e.g.*, Mayors during their term of office, are J.P.s *ex officio*. Most J.P.s are laymen, but all Petty-Sessional Courts are assisted by a trained magistrate's clerk, who is usually a solicitor.

These courts also act as courts of preliminary inquiry to determine whether there is a *prima facie* case (*i.e.*, a case that requires to be answered) against an accused which will require his being "indicted" for trial by jury. This they do by taking depositions from witnesses. If they decide that there is no *prima facie* case, the accused is discharged; if that there is such a case, he is committed for trial either to the Quarter Sessions or the Assizes. In many of the bigger towns a barrister known as a "Stipendiary Magistrate" is appointed to act as sole and permanent magistrate, and in London there are a number of such magistrates known as Metropolitan Police Magistrates.

2. *Quarter Sessions.*—These courts have a wide jurisdiction, but cannot try the most serious crimes, *e.g.*, murder, treason, or bigamy. Trial is by jury. The courts are of two kinds. Those which sit for the county are presided over by magistrates for the county; those for boroughs by experienced barristers known as "Recorders." Courts of Quarter Sessions also hear appeals from Petty Sessions.

3. *Courts of Assize.*—England and Wales are divided into a number of circuits of very ancient origin, each comprising a number of Assize towns. One or more judges of the High Court go on each circuit at least three times a year. Their criminal jurisdiction is unlimited, and they also deal with such civil cases as can be conveniently dealt with locally rather than at the High Court of Justice in London. A great many divorce cases are thus disposed of.

The Central Criminal Court, or Old Bailey, as it is popularly known, is the seat of the Assizes for the City and County of London and certain parts of the home counties. Because of the immense population of this area, the Sessions are held once a month, and four courts are held at a time.

4. *The Court of Criminal Appeal.*—This court is situated in the Royal Courts of Justice Building in London and usually consists of two judges of the Queen's Bench and the Lord Chief Justice. Appeals from Quarter Sessions and the Assizes lie to this court, which has powers to quash, reduce, or augment sentences on appeal.

5. *House of Lords.*—An appeal from the Court of Criminal Appeal lies to the House of Lords. This appeal is not, however, of right, and the "fiat" or permission of the Attorney-General must be obtained.

The constitution of the House of Lords as a judicial body is discussed on another page.

II. The Civil Courts.—1. *The County Court.*—There are about 500 County Courts in England and Wales which are grouped into circuits (not the same as the Assize Circuits). A County Court Judge visits each court at least once a month. Broadly speaking, his function is to try civil actions when the amount involved is not over £200, or in some cases £500.

2. *High Court of Justice.*—The High Court of Justice is one of the two branches of the Supreme Court of Judicature, the other being the Court of Appeal, described below. The High Court deals with all civil cases, except those dealt with by the County Courts or by the civil side of the Assizes. Since 1873 it has been divided into three divisions:—

(1) the Queen's Bench Division, which is principally concerned with Common Law cases (*e.g.*, defamation, breach of promise, damages for injuries, or breach of contract);

(2) the Chancery Division, whose functions have already been outlined; and

(3) the Probate, Divorce, and Admiralty Division, whose title is self explanatory.

3. *The Court of Appeal.*—Appeal lies as of right from decisions of the County Court and from the High Court of Justice to this court. Appeals are heard by courts consisting of three appeal judges, at the head of whom is the Master of the Rolls. The court can dismiss an appeal, allow it or make a fresh order as to damages or costs, or order a new trial.

4. *The House of Lords.*—Appeal lies from the Court of Appeal to the House of Lords. In some cases an appeal may be made without leave, in others leave of the Court of Appeal must be obtained. Only the "Law Lords" (or "Lords of Appeal in Ordinary"), who are eminent lawyers and life peers, and certain other high judicial appointees assist when the House of Lords is constituted as a judicial body to hear either civil or criminal appeals. They are presided over by the Lord Chancellor, who is the head of the English Judiciary. While other judges are appointed for life, his appointment is a political one, and he retains office only during the tenure of power of his party. He is, of course, always an eminent lawyer.

Judicial Committee of the Privy Council.—This is a committee of lawyers, drawn from the Privy Councillors, who hear appeals from decisions of colonial and ecclesiastical courts.

Juvenile Courts.—This is a special kind of Magistrates' Court to deal with accused persons under the age of eighteen. The magistrates chosen are specially qualified for the work, and where possible a woman is appointed as one of the three Magistrates who constitute the Court. The Court is held in private away from the ordinary court room. The object of the Juvenile Court is to introduce into the trial a plan to reform the offender by providing for the care and protection which he may need, by removal from undesirable surroundings, and by subsequent education or training. In these objectives the Court has the co-operation of social workers, including Probation Officers.

Probationary Officers are attached to particular Courts, sometimes a Magistrates' or a higher court. Sometimes an offender is not sentenced to punishment, but is released "on probation," that is on

the condition that he behaves well and follows directions given by the Court or by a probation officer. Such an officer is a trained man (or woman) who advises, assists, and befriends people who have been committed to his care by a court of law. The probation officer, by his assessment of the social background of the offender, can advise the court upon the wisdom of putting the offender on probation. The probation officer by his understanding can so befriend an offender as to provide a basis for his rehabilitation. He undertakes the "after care" of those released from prison or Borstal or approved schools, to which juveniles are sent.

Legal Aid.—If your means are small and you have reasonable grounds for taking proceedings in the High Court of Justice or Court of Appeal or (since 1956) in the County Court you can have the free services of a solicitor and, where necessary, of a barrister. A pamphlet explaining in broadest outline the main feature of the scheme for legal aid (under the Legal Aid and Advice Act, 1949) is issued by the Law Society. The Society has set up Area Committees and Local Committees on the subject. You can obtain the address from any County Court, any office of the National Assistance Board or any Citizens' Advice Bureau. Your Local Authority may also be able to give you the address. Full information is contained in a book published by H.M. Stationery Office entitled "Legal Aid under the Legal Aid and Advice Act, 1949." No one should act on the assumption that he is eligible for legal aid until a decision is reached.

Legal Advice.—The Act referred to in the preceding paragraph provided for a system of free legal advice. In 1958 the Government announced its support for a scheme proposed by the Law Society. This scheme would relieve much of the work done by Citizens' Advice Bureaux and Poor Men's Lawyer Centres.

Legal Aid in Criminal Cases.—The system of granting Legal Aid to persons charged with criminal offences is different from that applying to civil cases. Legal Aid in criminal cases originates from the Poor Persons Prisoners Act, 1903, now repealed; and Part II of the Legal Aid and Advice Act, 1949, augments the various Acts which were passed to replace the original 1903 Act and which is the foundation of the present system. In criminal cases a Certificate that a person should have free legal aid is granted at the discretion of the magistrate or Judge of the court where the case is to be held.

Proposed new Legislation.—At the time of going to press (February 1960) a Bill is before Parliament to extend the scope of legal aid to enable many people who cannot now qualify for legal aid and advice under the 1949 Act to do so. Under the new Bill the upper limit of the applicant's disposable income would be raised from £420 to £700 a year.

OUTLINE of the BRITISH COMMONWEALTH.

The Commonwealth is a free association of sovereign, independent States—the United Kingdom, Canada, Australia, New Zealand, South Africa, India, Pakistan, Ceylon, Ghana, and Malaya—together with the Federation of Rhodesia and Nyasaland. Nigeria was due to become the eleventh member upon gaining independence in October 1960. The United Kingdom, Australia, New Zealand, and the Union of South Africa have dependencies for which they are independently responsible. So vast and complex an association has not been easy to define with precision. For a long time the term "British Empire" was used, and the self-governing countries (other than the United Kingdom) were called "Dominions." These terms have now given place to "Commonwealth" or "Commonwealth of Nations" and "Members of the Commonwealth." The last term describes the ten sovereign countries named in the opening of this paragraph. Other parts of the Commonwealth, such as Colonies, while they may be described as "Commonwealth countries" are not *Members* of the Commonwealth.

The Nature of the Commonwealth.—The Commonwealth is not a federation, for there is no central government, defence force, or judiciary, and there are no rigid obligations or commitments between them. Nor is it a contractual association as the United Nations is. Like the United Kingdom itself the Commonwealth of Nations has no written constitution. But all its members have a broad community of interests, and they are bound together by a common sense of ideals and by a common interest in the maintenance of peace, freedom, and security. Although the Commonwealth includes about a quarter of the total population of the world about three-quarters of the Commonwealth's people live in India. The white population of the Commonwealth is only a small fraction of the whole. The diversity is further illustrated in religion, for the Commonwealth includes over 200 million Hindus, 100 million Moslems, and 80 million Christians. The same variety appears in climate and natural resources. But in spite of diversities of race, religion, language, and tradition, members share a common political heritage which has given rise to a broadly common pattern of institutions.

The Common Heritage.—All members have certain important constitutional features in common. They are parliamentary democracies, their laws being made with the consent of a freely elected parliament after discussion there. The government holds office because it has the support of a majority in that parliament. Ministers who must be members of parliament, are collectively responsible for the actions of the executive and must answer in parliament for all governmental administration. These salient constitutional features are similar to those described above in the Outline of Central Government. Lower houses are elected by secret ballot on a basis of adult suffrage, and they have the power of the purse, since they alone can originate or amend financial legislation.

The Sovereign and the Commonwealth.—At the head of each of the parliaments of the Commonwealth—except those of the republics of India and Pakistan—is the Queen, in whose name the administration is carried on. The Queen's legislative power is a formality—she reigns, though she does not rule; but she provides the element of continuity in the administration. The Queen is, therefore, Queen of the United Kingdom, Canada, Australia, New Zealand, South Africa, Ceylon, Ghana, and Malaya, and she is the symbol of their free association in the Commonwealth. India and Pakistan being republics with a President as Head of State, do not owe allegiance to the Queen, but accept her as the symbol of the free association of the member nations of the Commonwealth and as such the Head of the Commonwealth. The Queen has, therefore, in the seven countries named above, a relationship with the individuals comprising each country and also a relationship with the nation as a collective entity. In the case of India and Pakistan, she has only the latter relationship.

The Commonwealth in the World.—The Commonwealth as a whole, including the dependent territories, covers roughly speaking a quarter of the world's land surface and contains about a quarter of its population. The nations vary widely as has been explained, not only in size, background, geographical position, race, religion, language, but also in composition of population, industrial growth, and world importance. It is natural, therefore, that the approach of the different countries to international questions should vary, and on particular occasions they have voted on opposite sides in the United Nations.

Status of Member Nations.—The subordination of the Dominions, as they were then called, to

the United Kingdom had ceased for all practical purposes many years before that fact was embodied in the Statute of Westminster, 1931. The recognition of a situation already existing was made in the following words:—

> It is in accord with the established constitutional position that no law hereafter made by the Parliament of the United Kingdom shall extend to any of the said Dominions as part of the law of that Dominion otherwise than at the request and with the consent of that Dominion.

The United Kingdom Government cannot declare war or make peace for another Member of the Commonwealth of Nations or determine its foreign or fiscal policy. And that is true, of course, of every Member of the Commonwealth of Nations with regard to every other Member. They make their own laws and they decide their own policies. Now that the independence of Members of the Commonwealth is no longer in question there is a growing consciousness of interdependence—the added security and prestige and wider opportunities which flows from association in the Commonwealth.

The Right to Secede.—" The essence of the Commonwealth relation is that it is a free association of nations, with a common purpose, who belong together because they have decided of their own volition to give and to take their fair share in a world-wide partnership." These words were used when the Burma Independence Bill 1947 was being discussed in the House of Lords by Lord Listowel, then Secretary of State for Burma. " We do not regard membership of the Commonwealth," he said " as something to be thrust by force upon a reluctant people, but as a priceless privilege granted only to those who deeply desire it and are conscious of its obligations as well as of its advantages." But the Member states of the Commonwealth do not for the most part think in terms of the right to secede. It is a basic assumption that the Commonwealth is not only a voluntary and friendly but also a lasting friendship, providing the basis for long-term planning. In 1948 Eire declared its separation from the Commonwealth, and Parliament next year passed the Ireland Act 1949, recognising that Eire (to be known henceforward as the Republic of Ireland) had ceased to be a part of the King's dominions, while providing that the Irish Republic should not be regarded as a foreign country.

Defence.—Each Commonwealth nation is responsible for the organisation and training of its own defence force, and its military action is in no way bound by any decision of the United Kingdom. There is, of course, discussion between the Governments on important questions of policy, and considerable practical co-operation by such means as the exchange of training facilities, standardisation of equipment, and combined exercises.

The Colonies.—As stated in the opening passage of this outline, the United Kingdom, in common with other members of the Commonwealth, has certain dependencies which are described as " The Colonies." But this is a loose term, for " the Colonies " are not really all Colonies in the strict sense. What are loosely spoken of as Colonies are properly divided into Colonies, Protectorates, Protected States, Trust Territories etc.

Definitions.—*Colony.*—A territory belonging by settlement, conquest, or annexation to the British Crown.

Protectorate.—A territory not formally annexed, but in respect of which, by treaty, grant, usage, sufferance, and other lawful means Her Majesty has power and jurisdiction.

Protected State.—A territory under a ruler which enjoys Her Majesty's protection, over whose foreign affairs she exercises control, but in respect of whose internal affairs she does not exercise jurisdiction.

Trust Territory.—A territory administered by the United Kingdom Government under the trusteeship system of the United Nations.

Condominium.—A territory over which responsibility is shared by two administering powers.

Leased Territories.—This term applies only to that part of the mainland of China which was in 1898 leased to Great Britain for ninety-nine years and is administered by the Government of Hong Kong.

Responsibility of the British Government.—The British Government is responsible for the affairs of Colonies (properly called Crown Colonies) both internal and external, and for their defence, and their peoples are British subjects. Protectorates are governed in the same way as Colonies, but have not been annexed. The peoples of Protectorates are not British subjects but British-protected persons.

The Countries of the Commonwealth.—At the end of the Gazetteer is a list of all the countries of the Commonwealth showing their land area and recent estimates of population. The list distinguishes between the sovereign members and the British dependent territories, and classifies the latter according to the kind of dependency. Not all the British dependencies come exactly within the definition either of Colony of Protectorate, since, for historical reasons, many come partly under one heading, partly under another.

The Road to Independence.—During 1960 attention was focused on four British African dependencies. First and in the lead for independence was Nigeria, already self-governing and due to achieve independence in October. Next was Tanganyika, where self-government was granted as a step to complete independence at a later date. The other two dependencies, Uganda and Kenya, presented difficulties. Background notes on these four countries, as well as upon the Central African Federation, are offered in the following section " Changes in Africa."

Cyprus.—A settlement was dramatically reached in London in February, 1959, of the problem of Cyprus. Greece, Turkey, and Britain guaranteed the independence of Cyprus and undertook to prohibit, as far as lies within their power, all activity having the object of union of the new Republic of Cyprus with any other state, or the partition of the island. The three Powers made a Treaty of Alliance, to be embodied in a " tripartite headquarters " in Cyprus, the Greeks contributing a contingent of 950 and the Turks one of 650 soldiers. Britain undertook to transfer sovereignty over the island to the new republic on conditions and with the exception of two bases.

The Government of Cyprus.—The agreement also provided for a President (Greek) and a Vice-President (Turkish), a Council of Ministers, a House of Representatives and a Civil Service composed of Greeks and Turks in the ratio of seven to three. The Cypriot Army is to be composed of members of the two communities in the ratio of six to four. There are to be communal chambers for the management of purely communal affairs. The treaties and the new Constitution were due to be brought into effect during 1960.

Malta.—A Round-table Conference on the future of Malta recommended that Malta, if it chooses, should be given representation at Westminster. It suggested that there should be three Maltese representatives and that they should be elected in the same way and under the same laws governing representation as are members of the United Kingdom. A referendum was held in Malta in February 1956. The result was in favour of integration by a large majority, but only just over 60 per cent. voted in the referendum. Thus of the total votes cast approximately 75 per cent. were in favour of integration, although the pro-integration vote was only 45 per cent. of the electorate as a whole. Talks with Malta pro-

ceeded in 1957 on the constitutional and economic principles involved in the closer association recommended by the Round Table Conference. Unfortunately relations deteriorated and in 1958, upon the resignation of the Mintoff Government, the Governor assumed direct responsibility for the administration of the island. At the end of 1958 talks were resumed in London on the constitution. The Nationalist Party claimed Malta's rights to self government and the Malta Labour Party claimed independence. But the discussions led to no agreement on the future constitution of Malta. In 1959 the Government announced that Malta would be ruled through the Governor assisted by a council of about ten members, including Maltese.

The West Indies Federation.—In 1960 the Government of Jamaica said that that country might have to "contract out" and seek independence within the Commonwealth on its own, if agreement on the degree of central control in the West Indies Federation could not be reached with other member territories. In the autumn of 1959, there had been a constitutional conference to work out revisions of the present West Indian federal structure in preparation for the achievement of Dominion status; but strong differences of opinion had developed between Trinidad and Jamaica on the degree of economic control at the federal centre. If, as must be hoped, there were a successful outcome of further talks West Indians might be ready to ask Britain for sovereign status within the Commonwealth in 1961.

The Ever-changing Commonwealth.—There have been three major changes in the evolution of the Commonwealth. First, a multi-racial character was introduced in the conception of the Commonwealth when the Union of South Africa became a self-governing dominion. For the first time an area with a majority of non-British population became a Dominion. The second change was the Statute of Westminster, which recognised the independent sovereign and equal status of the members of the Commonwealth. But the essential European character of the Commonwealth still remained. It was in 1947, when India, Pakistan, and Ceylon elected to remain in the Commonwealth, that it changed its character from a political association of peoples of European stock into a world-wide community without any restrictions of colour or race.

Recent Changes in the Commonwealth.—There have been an increasing number of anomalies. One important change has been the adoption of a policy of neutrality by India. The SEATO arrangements are supported by Pakistan but not by India. Thus defence has already ceased to have an all-over Commonwealth character and is coming to be regional in character. Similar considerations apply to trade. It may not therefor be possible to produce a single joint conclusion on matters of internal policy.

The Defence of Human Rights in the Colonies.—To defend human rights in Britain and the Colonies, a council of British lawyers was established in 1957 under the chairmanship of Sir Hartley Shawcross and consisting of an equal number of members from all three British political parties. The Council is called "Justice," and it announced that it will be primarily concerned with abuses of justice, the substitution of bureaucratic for judicial processes, and the encroachment on the liberties of the individual in those territories for which the British Parliament is responsible.

Commonwealth Scholarships.—A start was made in 1960 under a scheme for creating 500 Commonwealth scholarships and visiting fellowships. The United Kingdom had agreed at the Commonwealth trade and economic conference in Montreal in 1958 to provide the money for half the thousand scholarships proposed. The Commonwealth Scholarship Commission will be responsible for selecting scholars and placing them in British universities and colleges of technology. The scholarships will be open to men and women under thirty-five who have already got their degree or equivalent qualification, and preference will be given to those between twenty-two and twenty-eight years of age. Awards will include the payment of fares, tuition fees, a grant for books and apparatus, a clothing allowance, travelling expenses, a personal maintenance allowance, and a marriage allowance where necessary.

Commonwealth Conference, May 1960.—It was announced that the Prime Minister of the Central African Federation would be present at this Conference but not the Prime Minister of the Federation of the West Indies or the Nigerian Federation.

CHANGES IN AFRICA.

At the end of the Second World War there were only four independent States in Africa. At the beginning of 1960 there were eleven:—

Egypt	Ghana
Sudan	Guinea
Libya	Liberia
Tunisia	Ethiopia
Morocco	Union of South Africa
Cameroon Republic	

By the end of 1960 there may be seventeen independent states in all, when nearly two-thirds of Africa's population of 230 millions will be independent. The further six countries achieving or seeking independence in 1960 are:—

Mali (Federation of Senegal and Fr. Sudan)
Nigeria
Togoland Republic
Somalia
Madagascar

Of the estimated population of 230 millions, 175 millions are Africans with widely different cultures and speaking some thousand different languages. There are about 5½ million Whites and about 50 million in the Arabic North who are Muslims.

Nigeria was due to become an independent sovereign State within the Commonwealth on October 1, 1960, being the eleventh State to win independence within the Commonwealth: the first was Canada in 1867. In December 1959 a general election was held for the House of Representatives which will rule in the first few years of independence. The Northern People's Congress did not have an overall majority, but won most of the seats because it was the party of the Northern Region, which is twice the size of the two other regions of the Federation put together. The National Council of Nigeria and the Cameroons, the party of the Eastern Region (led by Dr. Azikiwe, the East's Prime Minister), came second. The Action Party, led by the Prime Minister of the Western Region, came third. A coalition Government was formed from the two leading parties, but the Cabinet did not contain Dr. Azikiwe, the architect for twenty years or more of Nigerian independence.

Tanganyika was a United Nations trusteeship territory, for which Britain was responsible. The African population is under 9 millions, with 25,000 Europeans and less than four times that number of Asians. In December 1959 the British Government announced constitutional changes which would provide Tanganyika with an African majority in the Legislature and in the Ministerial Council. New elections on a much wider franchise were due to be held in September 1960. The new Legislature will consist of seventy-one elected members, with a few nominated members. Fifty of the seventy-one seats will represent "open" seats, that is to say, the electorate will be predominantly African. Eleven seats will be reserved for the Asian community and ten for the Europeans. This is the first time that power has been transferred in a country having large

minority communities of Asians and Europeans. It is in this respect that the grant of self-government to Tanganyika differs from that to Nigeria, Sierra Leone, and to Ghana (when still the Gold Coast), the three previous African territories to achieve self-government. Mr. Julius Nyerere, who seemed certain of becoming the head of the territory's first African administration, has proved the most successful of the Nationalist leaders in East and Central Africa. The problem before Tanganyika is to overcome the shortage of African professional and technical men, in a country which is economically far more backward than Kenya or even Uganda.

Uganda.—There are only about 4,000 white inhabitants in Uganda, and the quarrel is between Ugandans. In December 1959 the Buganda Lukiiko (or Assembly) announced that while they were not seeking complete independence for Uganda they were asking for as much independence as was possible consistent with a Federal Government for the whole country of Uganda. The smaller kingdoms of Ankole, Bunyoro, and Toro are also concerned about their autonomy.

Kenya.—A constitutional conference met in London in January 1960. The leaders, including Mr. Tom Mboya, of the all-African Kenya Independence Movement made plain their objective—universal suffrage at once, responsible government in 1960, no nominated members, and an African as Chief Minister. It was naturally asked by Kenya's Africans why they should lag behind Tanganyika, who would secure responsible government in 1960. One reason was that Kenya has a larger European element than Tanganyika. An end to the seven years of emergency rule in the Colony was announced just before the London Conference, by which time thousands of prisoners had been released. But there would be a Public Security Act to cover the "twilight" transition period giving the Government powers to control public meetings and to sanction political parties. Africans said they would not consider the emergency over until Jomo Kenyatta, who was to remain under restriction, was freed.

The Central African Federation.—The Federation was formed in October 1953, and comprises the self-governing colony of Southern Rhodesia and the protectorates of Northern Rhodesia and Nyasaland. The formation of the Federation was the object of much controversy in Great Britain. The constitution provided for the continuation of the protectorate status of the two northern territories, Northern Rhodesia and Nyasaland. Within the Federation the three territories retain the same constitutional status as before, except in respect of those matters which have been specially designated as Federal subjects. The ratio of black to white is thirteen to one in Southern Rhodesia, forty-two to one in Northern Rhodesia, and 588 to one in Nyasaland.

The Government of the Federation.—At first the Assembly of the Federation consisted of 35 members (17 from Southern Rhodesia, 11 from Northern Rhodesia, and 7 from Nyasaland). Of these 6 were specially elected Africans (2 from each territory) and there were 3 Europeans (1 from each territory) charged with special responsibility for African interests. This basis was altered in 1957 so that there are 59 members of Assembly, of whom 12 are specially elected Africans and 3 are European members for African interests. This change was declared by the African Affairs Board to be discriminatory against Africans. One of their reasons for this view was that Africans would still control the election of only 4 members in a house enlarged to 59. The African Affairs Board is a Standing Committee of the Federal Assembly and one of its functions is to draw attention to any Bill which discriminates against Africans. But the British Government did not uphold the appeal of the Board, and the change was made. The change was the basis on which an election was held in November 1958.

Review of the Central African Federation Constitution.—The constitution provides that some time between 1960 and 1963 there shall be a conference to review the constitution. The United Federal Party (of which Sir Roy Welensky is the leader) advocates that the Federal Government should then take over the responsibilities now exercised by the Colonial Office in Northern Rhodesia and Nyasaland and that safeguards for African welfare should be the subject of a treaty between the Federation and the United Kingdom. The Dominion Party advocates the declaration of independence after 1960 in defiance of Westminster, excepting the protectorates of Nyasaland and Barotseland (which is the south-western part of Northern Rhodesia), which it would leave under the joint authority of Colonial Office and the Federal Government. The common characteristic of both parties is their attitude to race and the call for white supremacy. The United Federal Party won the general election in November 1958. The African National Congress of Northern Rhodesia and of Nyasaland call for the complete dismemberment of the Federation.

The Monckton Commission was set up by the British Government in 1959 to make a preliminary survey of the constitutional problems of the Federation of Rhodesia and Nyasaland. The Opposition were invited to join it but declined, partly because the terms of reference had not, in their view, been clearly defined to allow it to consider other forms of association as an alternative to federation. They also urged that detainees in Nyasaland, and particularly Dr. Banda, should be released (or brought to trial) in an effort to win the trust of the Africans.

Community of Independent African States.—In November 1958 ex-British Ghana and ex-French Guinea announced that they were to constitute "the nucleus of a Union of West African States," despite the fact that the two countries are geographically separate (as Egypt and Syria are). Before Ghana achieved independence Dr. Nkrumah had envisaged a West African Federation which would include Nigeria, Sierra Leone, and Gambia and several other possible member states. In 1959 Dr. Nkrumah, the Prime Minister of Ghana, and his Guinea counterpart proposed a Constitution for a Union of African States. Their declaration was due to be submitted to the Parliaments of Ghana and Guinea and to all African States which have gained or are in the process of gaining independence It was superseded in July 1959 by an Agreement between Ghana, Guinea, and Liberia to form a Community of Independent African States.

Conference of Independent African States.—A biennial conference of heads of all independent African States, except South Africa, was initiated by Dr. Nkrumah at Accra in 1958. At the same time he launched the All-African People's Organisation, a non-governmental movement of nationalist parties meeting annually. This is not to be confused with the Afro-Asian Solidarity Movement, a non-governmental movement of nationalist parties in Africa, Asia, and the Middle East launched by Nasser in Cairo in 1957.

The Policies Advocated by the White Populations.—To solve the problem of multi-racial societies—in territories with a substantial minority of immigrant communities, mainly whites and Asians—different policies have been put forward by the white population. Four differing policies are apartheid, partnership, non-racialism, and integration. Apartheid, the official policy of the South African Government, keeps races apart in all ways, and is based on white supremacy. Partnership, advocated by the Prime Minister of the Central African Federation, while accepting the principle of political and economic integration, upholds residential segregation and does not contemplate African majority rule at any future time. Non-racialism strongly emphasises the importance of white leadership in Africa but accepts the principle of African majority rule, not in the immediate

but in the distant future. It calls for equal rights for all civilised people and is the policy of the New Kenya Party and liberal groups in Central Africa and South Africa. Continuing further on this liberal path, we reach the policy of Integration, which opposes all forms of racial discrimination. It accepts a common electoral roll with a majority of African voters, although it may not envisage social integration as an immediate objective. It is the policy of South African Liberals.

OUTLINE OF THE UNITED NATIONS.

The Origin of the United Nations.—Great Britain, U.S.A., Russia, and China made the first draft of a new World Peace Organisation in 1944 at Dumbarton Oaks, near Washington. There was a strong resemblance in the Charter to the Covenant of the League of Nations, which had been the international organisation between the two World Wars. But an Economic and Social Council was added to help the Assembly on a wide range of subjects. The right to take action to keep the peace was centralised in a Security Council of eleven.

San Francisco Conference, 1945.—The Dumbarton Oaks plan and the Yalta interpretation on voting in the Security Council thus formed the basis of discussion at the San Francisco meeting of fifty States.

Charter of the United Nations.—The Charter of the United Nations was signed on June 26, 1945. The purposes of the United Nations can be divided into four groups (security, justice, welfare, and human rights) and the nations undertook to carry out four main duties (to settle disputes peacefully, to refrain from treating or using force, to assist in carrying out the Charter, and not to assist an aggressor). The UN affirms faith in the human rights of all without distinction of race, language, sex, or religion.

Membership of the United Nations.—The UN had eighty-two member countries at January 1960. They were:—

Afghanistan
Albania
Argentina
Australia
Austria
Belgium
Bolivia
Brazil
Bulgaria
Burma
Byelorussian S.S.R.
Cambodia
Canada
Ceylon
Chile
China (Taiwan)
Colombia
Costa Rica
Cuba
Czechoslovakia
Denmark
Dominican Republic
Ecuador
Egypt and Syria
El Salvador
Ethiopia
Finland
France
Ghana
Greece
Guatemala
Guinea
Haiti
Honduras
Hungary
Iceland
India
Indonesia
Iran
Iraq
Ireland
Israel
Italy
Japan
Jordan
Laos
Lebanon
Liberia
Libya
Luxembourg
Malaya
Mexico
Morocco
Nepal
Netherlands
New Zealand
Nicaragua
Norway
Pakistan
Panama
Paraguay
Peru
Philippines
Poland
Portugal
Roumania
Saudi Arabia
Spain
Sudan
Sweden
Thailand
Tunisia
Turkey
Ukrainian S.S.R.
Union of South Africa
U.S.S.R.
United Kingdom
United States
Uruguay
Venezuela
Yemen
Yugoslavia

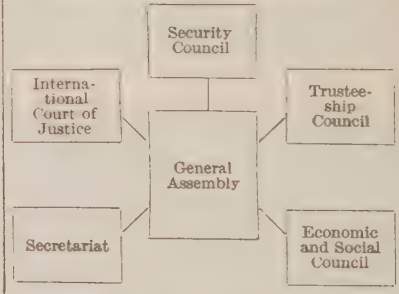
Present and Original Membership.—The classification of the present eighty-two members and of the original fifty-one members is as follows:—

	1945.	1959.
Americas	22	22
Western Europe	8	16
Soviet bloc	6	9
Asian	9	} 30
African	3	
Others	3	5
Total	51	82

Major Organs of the United Nations.—The UN have six major organs: (1) a General Assembly, (2) a Security Council, (3) an Economic and Social Council, (4) a Trusteeship Council, (5) an International Court of Justice, and (6) a Secretariat. It is especially the inclusion of the third body on this list (with all the Commissions and specialised agencies which stem from it) which makes the UN more broad and balanced than the League of Nations.

General Assembly.—The General Assembly occupies a central position in the structure of the UN. But its business is quite distinct from the Security Council. It meets once a year. The Assembly can consider the general principles of co-operation for peace and security and disarmament and regulation of armaments. It can discuss any question concerning peace and security brought before it. It makes recommendations, but any question upon which action is necessary must be referred to the Security Council. The carrying out of its humanitarian work is the function of the new Economic and Social Council (dealt with below) which it elects and supervises. Further, the Assembly controls the purse.

Principal Organs of the United Nations.



The Security Council.—The aims of the UN are wide—from feeding starving peoples to encouraging self-government in backward areas—but it cannot advance towards the noble objectives set out in the Preamble unless peace is maintained. The principal organ to preserve peace and security is the Security Council. It has eleven seats, of which five are permanently occupied by Great Britain, the U.S.A., the U.S.S.R., China, and France. The China which is represented in the UN and on the Security Council is not, however, the Republic of China (or Communist China). It is the régime of Chiang-kai-Shek, who occupies Formosa. The other six are elected for two years by the General Assembly. These six are (1960), Argentina, Italy, Tunisia, Ecuador, and Ceylon; the sixth seat being shared by Poland and Turkey (one year each). The Security Council sits continuously. It has two functions: (1) to promote the peaceful settlement of disputes and (2) to stop aggression. Under the Charter, parties to a dispute have already promised not to use force, and to settle their quarrels peaceably and to refer their dispute to the Security Council if they really cannot reach a peaceful settlement. On its side the Council can call on the parties to settle disputes peacefully, it can investi-

gate any situation likely to cause a breach of the peace, and at any stage it can recommend a solution.

The Veto.—At this point we must deal with the veto, which applies to substantive questions. A decision needs only seven out of eleven votes. Five of the seven votes must be those of the permanent members, namely the United Kingdom, the U.S.A., U.S.S.R., China, and France. In other words if any one of them says " No " to the use of force, even after a full investigation, the Council cannot use force to settle the dispute. Thus when it comes to imposing sanctions for a breach of the peace the assent is required of the Great Powers, and one of them may of course be a party to the dispute. If the Great Powers imposed sanctions on each other it would mean a major war in which the present UN would disappear. Partly in order to overcome the difficulty of the veto the Assembly has set up a Committee to remain in permanent session consisting of one representative of each member. It is known as the Little Assembly, its formal title being the Interim Committee.

The Uniting for Peace Resolution, 1950.—The General Assembly had always been able to discuss matters of peace and security, although it could not make recommendations about them if they were being considered by the Security Council. But in 1950, after the Korean crisis, a new decision was taken by the General Assembly whereby if there were some threat or breach of the peace on which the Security Council was in deadlock, the Assembly, on a vote of seven members of the Security Council, could consider it immediately and make a recommendation about it. This decision, to which Russia and four other countries were opposed, was called the " Uniting for Peace " resolution. By this resolution, too, the Assembly could be called together within twenty-four hours. It was the standing Interim Assembly which considered the Israeli–Egyptian dispute in November 1956.

The Economic and Social Council.—The UN pledged themselves to a broad humanitarian policy of which the following are salient points: to promote higher standards of living; full employment; the conditions of economic and social progress; solutions of international economic, social, health, and other related problems; educational co-operation; universal respect for human rights; and the fundamental freedoms for all. The main business of the Economic and Social Council is to carry out this broad policy. To tackle these huge problems the Council established a number of important commissions and bodies, which fall mainly into the following categories.

Regional Economic Commissions

- Economic Commission for Europe (ECE)
- Economic Commission for Asia and the Far East (ECAFE)
- Economic Commission for Latin America (ECLA)
- Economic Commission for Africa (ECA)

Functional Commissions

- Technical Assistance Board (TAB)
- Transport and Communications
- Fiscal
- Statistics
- Population
- Social
- Human Rights
- Status of Women
- Narcotic Drugs

Special Bodies

- UN Children's Fund (UNICEF)
- Commissioner for Refugees

Intergovernment Agencies (previously called Specialised Agencies).—The agencies are organisations established by intergovernmental agreements, and their activities as a rule are co-ordinated by the Economic and Social Council. The list of the thirteen Agencies are given below.

- International Atomic Energy Agency (IAEA)
- International Labour Organisation (ILO)
- Food and Agriculture Organisation (FAO)
- UN Educational, Scientific and Cultural Organisation (UNESCO)
- World Health Organisation (WHO)
- International Bank for Reconstruction and Development (Bank)
- International Finance Corporation (IFC)
- International Monetary Fund (Fund)
- International Civil Aviation Organisation (ICAO)
- Universal Postal Union (UPU)
- International Telecommunication Union (ITU)
- World Meteorological Organisation (WMO)
- Inter-Governmental Maritime Consultative Committee (IMCO)

Several of these organisations were at work before the UN was set up. One such body is the ILO.

Economic Commissions.—ECE was the first of the great Regional Commissions to be set up under the auspices of the Economic and Social Council, and it was established in 1947 to facilitate concerted action for the reconstruction of Europe. The success of ECE has led to the establishment by the UN of similar Economic Commissions for Asia, for Latin America, the Far East, and Africa. ECE is described further in the section devoted to European Organisations.

Technical Assistance to Under-developed Countries.—One of the most important developments of the last decade has been the creation of a world-wide scheme for the sharing of skills and knowledge between nations. At least half of humanity is ill-fed and illiterate. Only one-quarter of the world's people can expect, on the average, to live beyond the age of thirty-eight. Two-thirds of mankind live in the world's less-developed areas, where hunger, disease, and poverty are a daily lot; and of the eighty-two members of the UN sixty can still be regarded as under-developed. But there is no longer the fatalistic resignation of past ages to such human misery. The achievements and promises of modern technology have stimulated demands the world over for a better life. " It is the first age since the dawn of history," wrote Arnold Toynbee, " in which mankind has dared to believe it practicable to make the benefits of civilisation available to the whole human race." This assistance has been organised by the UN under three schemes, Technical Assistance, the Expanded Programme of Technical Assistance, and the Special United Fund (called SUNFED). These are described below.

Technical Assistance Scheme.—Help is given only at the request of a government, and the skill-sharing operations of the UN are aimed at helping countries to help themselves. Requests cover a vast range of development problems, from fish-breeding to fiscal reform, from handicrafts to housing, from timber-cutting to traffic control. There is hardly a country which has not obtained technical assistance. Nearly every country, regardless of its stage of development, can provide some special knowledge or skill to help some other country improve its living standards. Those who receive aid often provide aid to others. There is therefore not a one-way flow of skills from the more to the less developed countries; but rather a cross-fertilisation of skills on a world-wide scale.

The Expanded Programme (EPTA).—A sign of the value which governments put on the international skill-sharing programmes was the fact that they offered voluntary contributions to pay for an Expanded Programme of Technical Assistance. Hitherto the basic programmes had been met by regular membership dues. In the last nine years eighty-five governments have paid about 250

million dollars. Seven of the intergovernmental agencies (such as the ILO, FAO, and UNESCO) work together under the Technical Assistance Administration to provide the technical help, whether it be paid out of the regular budgets or out of the voluntary contributions of governments in cash or services.

The Special Fund (SUNFED).—In December 1957 the Assembly decided on the establishment of a Special Fund with a special purpose, namely to create more favourable conditions for investment—private and public, national and international—in the less-developed countries. It concentrates on relatively large projects and urgent needs which cannot at present be met by one of the existing UN methods. Up to 1959 thirteen projects had been approved with a budget of nearly 8 million dollars. During the next ten years the net increase in national income in the under-developed countries—allowing for population growth—should be at least 2 per cent., instead of an average of 1 per cent. But even this rate would be too slow—dangerously too slow. The growth of the Expanded Programme is limited by the inadequacy of funds.

Food and Agricultural Organisation.—We can here deal with only some of the specialised agencies. It has been a major concern of FAO to improve the world's food supply and to devise ways of preventing both shortages and surpluses of agricultural commodities. It has taken measures to control pests, infestation of stored grains and animal diseases. Rinderpest, the most serious of livestock diseases, kills over 2 million cattle annually in Africa, Asia, and the Far East. The organisation gives technical assistance to countries wherever such assistance can bring new land under cultivation, improve the yield of land already cultivated, raise levels of consumption, or provide better living conditions in rural areas.

The United Nations Educational, Scientific, and Cultural Organisation hopes to build peace and security by assisting in collaboration between nations through education, science, and culture in order to further universal respect for justice, for the rule of law, and for fundamental human rights. It is trying to wipe out illiteracy and to raise educational standards everywhere. UNESCO, because of its special concern for international understanding, has made suggestions for the teaching of geography and for improving text-books and teaching materials. The organisation has devised projects into, *inter alia*, the methods of political science and the methods which have developed in education, psychology, and in philosophy for changing mental attitudes. A UNESCO Report published in 1957 stated that more than two-fifths of the world's population aged fifteen or over still cannot read or write.

The International Bank and the International Monetary Fund.—These two agencies of UNO became better known to newspaper readers during the autumn of 1957, when steps were being taken to defend the pound sterling from devaluation. Bank and Fund, as they are called, grew out of the Bretton Woods Conference in 1944, when forty-four nations laid plans for a new method of economic and financial co-operation in the post-war years. The Bank was designed to promote the international flow of capital for productive purposes. It has made development loans to numerous countries. The Fund was created to assist in stabilising international exchange; to provide member nations with short-term foreign-exchange assistance; and to hasten the removal of artificial barriers to international payments.

The World Health Organisation essays to eliminate three of the world's major diseases—malaria, tuberculosis, and venereal diseases. It has effectively controlled malaria in Italy and Greece, and greatly increased the production of DDT, which is effective in eradicating the carrier of malaria. The disease still kills about 3 million annually throughout the world out of the 300 million whom it strikes. In the field of tuberculosis the organisation has undertaken mass immunisation. *See also* P72.

The United Nations Children's Fund (UNICEF) is the world's largest international effort to improve the health and welfare of children and the mothers who bear them. Its first mission is to protect children against disease, principally the child cripplers: malaria, tuberculosis, and yaws. Millions of babies die annually because of ignorance, and the Fund's second mission is therefore to teach and train mothers in hygiene and child care. The Fund provides equipment, insecticides, vaccines, and drugs for campaigns against disease. It ships powdered milk to combat hunger sickness; and helps to build up local milk supplies for children. UNICEF was set up as an integral part of the UN in 1946. It was called into being to grapple with an emergency, as its original name "the United Nations International Children's Emergency Fund" denoted.

World Refugee Year.—Upon British initiative the UN called for a World Refugee Year, which began in June 1959 in an attempt to harness public opinion everywhere in a concerted effort towards the solution of some of the world's worst refugee problems. The United Kingdom Committee decided on four objectives. In Europe the aim was to close the refugee camps and to find homes or livelihoods for the 24,000 people who live in them; training, grants, and skilled guidance for the refugees of the Middle East; emergency relief for the million Chinese refugees in Hong Kong; and resettlement for the 8,000 European refugees from China in the Far East. The aim was to secure £2 million voluntarily for these purposes; and the Government contributed £200,000.

The International Court of Justice.—The Court is the principal judicial organ of the UN and consists of fifteen judges elected by the General Assembly and the Security Council. No two of the judges may be nationals of the same State. The judges must be independent of national interests, and they declare solemnly in open court that they will exercise their powers impartially and conscientiously. Countries which are parties to the Statute of the Court can refer to it any case they wish. The Court meets at The Hague.

Acceptance of Compulsory Jurisdiction.—Unfortunately only thirty-nine states, out of the eighty-four parties to the Statute of the Court, now accept compulsory jurisdiction. Furthermore, certain states have replaced or renewed their acceptance by declarations containing new and far-reaching reservations. There is natural concern lest the decline in the acceptance of compulsory jurisdiction, if not soon halted, may render the whole system of compulsory jurisdiction, as contemplated by the founders of UNO, virtually illusory.

Reservations by the United Kingdom.—In 1957 the British Government announced that they would no longer accept the jurisdiction of the International Court of Justice in disputes relating to any questions which by international law fall within the jurisdiction of the United Kingdom. They also excepted from the Court's jurisdiction disputes in respect of which any other party to the dispute has accepted the jurisdiction of the International Court only in relation to or for the purposes of the dispute; or where acceptance of the Court's compulsory jurisdiction on behalf of any other party to the dispute was deposited or ratified less than twelve months prior to the filing of the application bringing the dispute before the Court. The latter reservation was meant to exclude the possibility of another government accepting the Court's jurisdiction *ad hoc* when it thought it had a good case against the British Government and then refusing to accept it when the British Government themselves had a good case.

New American Attitude to International Court of Justice.—In 1959 it was announced that Congress would be asked to remove the most restrictive reservation it places on its acceptance of the jurisdiction of the International Court. In 1946 the U.S.A. had excluded from the Court any disputes "which are essentially within the domestic jurisdiction of the U.S.A. as determined by the U.S.A." It was proposed to withdraw this reservation in order to "advance the rule of law in the international field." Events in Hungary and Tibet seemed to provide the reason for trying to establish greater hopes of determining such international disputes. There were some hopes that Soviet countries might be brought into the international judicial field. Only Bulgaria of the Eastern European countries has acceded to the Statute of the Court. Twelve other countries had appended restrictive reservations identical to that made by the U.S.A. in 1946 at the inspiration of that Government; and it remained to be seen whether they would withdraw it when the U.S.A. withdrew the restriction.

The New Russian Disarmament Proposals, 1959.—The Soviet Premier Nikita Khrushchev visited UN Headquarters in New York in September 1959 during his tour of the U.S.A. He addressed the General Assembly three days after the opening of the 14th session on September 15. The essence of the Soviet proposals was complete disarmament over a period of four years. Armies, navies, and air forces would cease to exist, and general staffs and war ministries would be abolished. Military bases in foreign territories would be abolished. All atomic and hydrogen bombs at the disposal of states would be destroyed and their further production terminated. States should have at their disposal only strictly limited contingents of police or militia, agreed upon for each country. He also proposed an international control body.

A Three-stage Plan.—It was intended that the four-year programme of disarmament would be carried out in three stages. During the first stage the armed forces of the U.S.S.R., the U.S.A., and the Chinese People's Republic would be reduced to a level of 1·7 millions each, and those of the United Kingdom and France to a level of 650,000 each. The armed forces of other countries would be specially agreed by the General Assembly. During the second stage, the disbanding of all armed forces would be completed and military bases on foreign soil would be eliminated. During the third stage, the destruction would take place of all nuclear weapons, missiles and stockpiles of chemical and bacteriological weapons. The funds made available by disarmament would be used "to subsidise national economies and to furnish extensive economic and technical assistance to under-developed countries."

The United Kingdom Proposals for Disarmament, 1959.—Shortly after the Russian proposals had been made, Mr. Selwyn Lloyd outlined a comprehensive three-stage plan by which, he said, the United Kingdom felt progress might be made in disarmament, "if there is a will." Development of the plan "would of course, depend upon the development of the techniques of international control." The plan included:—

(1) a first stage, in which agreement would be reached on a number of major issues, such as the discontinuance of nuclear tests and the limitation of armed forces, and a study would be undertaken of the problems involved in the use of outer space;

(2) a second or "intermediate stage," in which a beginning would be made at putting some of the agreements reached into preliminary or progressive effect; and finally,

(3) a third stage embodying "the ultimate objective . . . comprehensive disarmament by all powers, under effective international control."

Mr. Lloyd stressed that the control organ "will not only have to control disarmament measures, but will also have increasing responsibilities within the framework of the United Nations to preserve world peace as purely national armaments diminish."

Assembly Transmits Disarmament Proposals to Geneva Committee.—The General Assembly in November 1959 unanimously agreed to transmit all the proposals on disarmament which had been made at the current session to the new ten-nation Disarmament Committee "for thorough consideration." The ten-nation Committee was expected to meet in Geneva early in 1960. It was made up of representatives from:—

Bulgaria	Poland
Canada	Roumania
Czechoslovakia	U.S.S.R.
France	United Kingdom
Italy	U.S.A.

The proposals include the Soviet Union's programme for general and complete disarmament over a four-year period, the United Kingdom's plan for disarmament in three stages, and all other proposals and suggestions advanced. The Soviet delegation spoke with appreciation of the "business-like co-operation" which had taken place between itself and the U.S.A. in working out the joint text of the resolution on the subject.

Three Consequential Questions.—During the debate at the UN the U.S. representative, who pledged his country to participate fully and constructively in the work of the ten-nation Committee, said that "if all nations lay down their arms, there must be institutions to preserve international peace and security, and to promote the rule of law." He therefore offered three questions for the Committee:—

1. What type of international police force should be established to preserve international peace and security?
2. What principles of international law should govern the use of such a force?
3. What internal security forces, in precise terms, would be required by the nations of the world if existing armaments are to be abolished?

The Arms Race.—The best account of the disarmament discussions carried on by the Great Powers is contained in a book published in 1958 entitled *The Arms Race*, by Mr. Philip Noel-Baker (Stevens and Sons Ltd., 25*s*.). The author has campaigned for more than thirty years for world disarmament and has attended many conferences in an official capacity. There can be few people with a greater grasp of all the technical and legal problems involved and with a better knowledge of the history of the subject. In no sense, therefore, can Mr. Philip Noel-Baker be regarded as a "starry-eyed" idealist. For that reason his final convictions, stated at the end of his authoritative analysis, are all the more remarkable and valuable. He does not believe that the technical difficulties are so great that they could not be readily overcome if there was a will to overcome them. He thinks that the romanticists are those who still believe that modern armaments can make a nation safe. "There is no military defence today for any nation," he writes, "except in drastic measures of disarmament . . . to which all governments subscribe. From the first day that this treaty enters into force and the UN inspectors take up their posts in the countries which they will control, the security of every nation will at once, and notably, be increased . . . it will do much to end the 'nightmare fear' of sudden and unprovoked attack." He thinks facile pessimism a graver fault than facile optimism and that defeatism about the feasibility of plans for disarmament has been "the most calamitous of all the errors made by democratic governments in modern times."

The 1959 Nobel Lecture.—Mr. Philip Noel-Baker received the Nobel Peace Prize for 1959, and in his Nobel Lecture said that in 1914 the nations were spending about £500 millions a year on preparing for war; today they were spending £40,000

millions. "It is the strangest paradox in history," he said. "Every new weapon is produced for national defence; but all experts are agreed that the modern, mass-destruction, instantaneous-delivery weapons have destroyed defence." "What is left," he asked, "of the morality on which our Western civilisation has been built?"

The Campaign for Nuclear Disarmament has, as its purpose, to press for a British initiative to reduce the nuclear peril and to stop the armaments race. It is argued that the possession of a few hydrogen bombs and Britain's part in the nuclear arms race is both morally wrong and rationally indefensible. Whatever agreements might or might not be reached, it is urged that Britain, with as many nations with her as possible, but if necessary on her own, should renounce unconditionally the use and production of nuclear weapons, by herself or in her own defence. The Campaign puts forward four immediate proposals:

1. That the British Government should halt patrol flights of aeroplanes equipped with nuclear weapons, in view of the danger, if the plane crashes, from plutonium; and the graver danger that such accidents may be mistaken for enemy action and trigger off a nuclear war.
2. The stopping of testing of nuclear weapons.
3. That the Government should not proceed with the establishment of missile bases in Britain. They would make Britain the first target if a nuclear war breaks out.
4. That Britain should refuse to supply other powers with nuclear weapons. Three nuclear powers are bad enough. Ten or twenty would be disastrous.

In the view of the sponsors of the Campaign the so-called "Great Deterrent" is a myth. The risks we run now, the argument continues, are far greater than any involved in renunciation. Civilisation cannot survive a nuclear war. Bertrand Russell said, "At present it seems an even chance whether any human beings exist forty years hence. If man is to survive, the trend must be reversed."

The Rapacki or Disengagement Plan.—This plan for disengagement in Europe was put forward in February 1958, and was later amended by him to take account of some of the Western objections. As revised, the plan provided for a zone free of nuclear weapons to be created in Central Europe and to consist of East and West Germany, Czechoslovakia, and Poland. There would be two stages of advance:—

1. The Governments of these countries would undertake not to produce nuclear weapons. Armies in the zone, except the British, American, and Russian, would undertake not to acquire them.
2. In the second stage all the Powers concerned would discuss reduction of conventional forces; and if agreement were reached the reduction would then be made simultaneously with the complete removal of all nuclear weapons.

Merits of the Rapacki Plan.—An opportunity to reduce armaments is more likely to be taken if it is applicable to a limited area. The plan would need a control system, and this would be supervised by both the Western and the Eastern countries, that is to say, by representatives of NATO and Warsaw Treaty Powers. There would thus be a very valuable experiment and experience in joint control. There are some classic examples of neutral or demilitarised zones and frontiers. One is the frontier between the U.S.A. and Canada; and another the frontier between Sweden and Norway. Demilitarised zones diminish dangers arising in those zones; and by their very success such zones tend to be forgotten.

Objections to the Rapacki Plan.—One objection offered was that the plan made no provision for the reunification of Germany. Another was that there would still be preponderant Russian conventional forces on the Polish–Soviet frontier, and within easier striking distance of the centre of the zone than the withdrawn Western forces. General Norstad, the NATO Supreme Commander, said in 1959, "The withdrawal of United States forces from Germany, even with the corresponding withdrawal on the Eastern side, would spell added weakness for the West . . ."

The Geneva Conference on Berlin, 1959.—The Foreign Ministers of Russia, Britain, France, and the U.S.A. conferred for three months at Geneva in 1959 on the subject of Berlin. The Soviet Government had proposed to bring the four-Power occupation of Berlin to an end by transferring all its remaining rights in East Berlin to the East German Government. They had proposed, further, that West Berlin should be made an independent political entity or free city with its own Government. They had thought, originally, that West Berlin should be demilitarised and all troops withdrawn; but they later conceded retention of token forces. No agreement on all this was reached at the Geneva Conference. But the Conference seems to have confirmed the British view that Berlin's ultimate freedom depends on negotiating a wider and more lasting settlement with Russia, and not simply on Western strength.

The Summit Meeting, 1960.—These notes were written before the Meeting in Paris, in May 1960, of the heads of Government of the Western Powers—Britain, France, and the U.S.A.—with Russia. At the end of 1959 the three Western Powers who would attend the Summit Conference and West Germany held a preliminary meeting in Paris in an attempt to co-ordinate their policies. Britain and the U.S.A. wanted a short summit conference which might be the first of several, with the modest aim of making progress on one or two points, such as an interim settlement on Berlin, an agreement to stop nuclear tests, and, perhaps, a talk on general disarmament. France had wished for one big conference to deal with a whole range of problems, taking in problems of Africa, the Middle East, and the Far East. Germany—not entitled to be present—was not in favour of a summit meeting, unless its discussion of the Berlin problem were linked to the wider question of Germany and in turn to general disarmament.

Both France and Germany believed that at present there was no basis for negotiating on Berlin and that to do so would result in weakening concessions being made. They seemed to think that delay was necessary so that certain strengthening factors could come into play, namely, German rearmament, the development of French nuclear power, the end of the Algerian war, and the development of the Common Market.

Nuclear Tests.—The first real sign of progress towards an agreement to stop nuclear tests was reported at the end of 1958, when Britain, the U.S.A., and Russia announced their acceptance of the first four draft articles of a treaty. But these articles indicated what should be done and not how it should be done. The three Powers agreed on the composition of the organisation which would control the ban on nuclear-weapon tests. The four component parts would be: a control commission (acting as the governing body), the detection system, the executive head of the control organisation, and the conference of parties to a test prohibition treaty. The crucial questions of control and veto remained to be settled. By the beginning of 1960 the Geneva Test Conference had agreed on seventeen out of twenty-three articles in the draft treaty. Underground tests remained the one major problem left unresolved. American scientists claimed that an explosion five times as great as the Hiroshima blast could be virtually undetectable; and this was held to reinforce the case that underground tests should be excluded, at present, from any treaty. But no inspection system can be foolproof. The West had always insisted on the importance of inspection; and the principle and virtually all details of inspection had been accepted by the Russians. It would therefore be a grave set-back if the West

were to declare that, after all, inspection is unworkable. The U.S.A. announced at the opening of 1960 that they reserved the right to hold more nuclear tests.

Atomic Radiation.—In January 1960 the UN Scientific Committee examined "food chain" problems, that is to say the passage of radioactive isotopes from soil to plants, and hence to animals and into human diets. Another UN Scientific Agency—the World Meteorological Organisation—sent specialists to join the Committee in discussions on ways in which radioactive debris from nuclear tests is transported in the atmosphere, especially at high levels.

The Treaty of Antarctica.—Twelve nations agreed in December 1959 that Antarctica should be used only for peaceful purposes and that scientific investigation should continue there freely. Argentina, Australia, Belgium, Chile, France, Japan, New Zealand, Norway, South Africa, the U.S.A., Great Britain, and Russia renounced no territorial claims (Argentina and Chile had stressed this particularly), but agreed to the freezing of them for thirty years with no new claims. Nuclear explosions were prohibited pending an international agreement, and an inspection system would prevent military activities. Russian acceptance was particularly encouraging, as was her acknowledgement of the authority of the International Court of Justice to deal with legal disputes in Antarctica.

What can the United Nations Do?—The UN sends investigating bodies to study on-the-spot situations in troubled areas, so that it may have first-hand information when recommending the steps to be taken. The UN itself takes measures to end disputes; for example, by appointing a group or a person to help opposing sides to agree (as in the cases of Palestine, Indonesia, and Kashmir). The UN may take collective measures to maintain or restore peace, if peace is threatened or broken or some country has committed an act of aggression, as it did in Korea. Work by the UN to prevent the use of atomic weapons in war has been accompanied since 1946 by efforts to harness atomic energy for peace; and the Statute for an International Atomic Energy Agency has been described. The UN tries to secure agreement to reduce armaments, and the work of its Disarmament Commission is described below.

The UN Technical Assistance Administration, with seven specialised agencies, assists the under-developed countries. The UN has proclaimed a Universal Declaration of Human Rights as a common universal standard; and it agreed upon a convention to prevent genocide (the killing of groups of people belonging to a particular race, nationality, or religion).

United Nations Emergency Force.—This force was created for temporary duty in the Middle East in 1956. UNEF has had more than two years of successful service. It still safeguards peace along the armistice line between Egypt and Israel, and it has given to the world the first successful pattern for an international police force. Of the twenty-three countries which had offered to send troops, contingents were accepted from ten nations. The total strength of UNEF was nearly 6,000, of which the largest detachments came from Canada and India, the smallest from the four Scandinavian countries, and the others from Colombia, Yugoslavia, and Indonesia. The men are distinguished by their blue berets.

World Government: the First Five Steps.—In a manifesto published in 1958 the British Parliamentary Group for World Government, to which 135 members of all parties from both Houses belong, set out what it considers must be the first five steps towards federal world government. These are:—

1. The Government should declare that the creation of a world authority will be the aim of its foreign policy and invite other Governments to do likewise.
2. The existing UN Truce Supervision Commission should be expanded or transformed to become a permanent peace force.
3. Explore how UN Charter might be transformed into a world federal government.
4. Alongside the existing advisory wing of the United Nations there should be created a new wing with real powers over limited fields such as the jurisdiction and control of the high seas outside territorial waters, of major international waterways, and Antarctica.
5. A world economic development authority should be created to which all member states would subscribe annually a percentage of their total national product.

New Trends and Leadership at UNO.—The most important new fact about the UN is its increasing influence. It can now be left out of no country's calculations. It has been called the fifth Great Power, and it represents the influence of a massive public opinion. For one thing there has been a flow of new nations into the organisation—thirty-two new nations were admitted to membership between 1946 and 1958—and the Assembly is now predominantly composed of small nations. Although many of these nations are poor and under-developed, they want to assert their independence of the Great Powers and their conviction that economic development is first priority and that disarmament can release energy to help them. The Assembly, in which these nations are making their influence felt, is replacing the Security Council (dominated by the Great Powers) as the mainspring of the UN. Another important trend is that assistance to the poorer two-thirds of the world may eventually be carried out mainly through UN agencies, America being desirous of giving a greater share of responsibility to UN bodies. There is, however, growing need for better leadership of the smaller nations or what might be called the back-bench nations of the world. At one time India provided this leadership and later Canada, and at the last sessions of the Assembly Ireland gave a strong lead. How the smaller powers will develop their influence in world councils and who will emerge as their leader is one of the aspects of UNO which will be worth watching.

OUTLINE OF EUROPEAN ORGANISATIONS.

1. Introduction.

This outline is an attempt to explain the various organisations through which European countries are trying to co-operate. It is hoped that the reader, with the help of the chart, will find the pattern less bewildering than at first appears; and that he will be in a better position to understand the proposals which have been made, and which are also explained, for simplification of the whole design. The destruction in Europe in the Second World War emphasised the need for greater union, both for recovery and for defence. A bewildering array of organisations has sprung up. They differ in form, in function, and in membership. Some overlap in function. Some are much less effective than others. The edifice is not, moreover, built on a single harmonious plan. Beneath the edifice are two different kinds of foundations, that is to say, two rival theories. These two theories (the federalist and the functionalist) are explained as the story unfolds. The story traces three main streams—the military, the political, and economic developments—and describes the bodies which evolved in each stream. The account concludes with an explanation of some suggestions which have been made to make the organisations more effective by better co-ordination.

Historic Origin of European Unity.—Sully, the famous Minister of Henry IV, King of France, outlined, in 1638, a proposal for achieving European unity and putting an end to war in Europe. He called it the "Grand Design." It was revived in modern dress by Monsieur Briand, the French Prime Minister, in 1929. During the War (1943)

the concept of a United Europe which should be created after victory was won was outlined by Sir Winston Churchill: and he returned to the subject in his famous speech at Zurich University in 1946.

Two Starting Points: ERP and the Brussels Treaty.—There were two main sources of the present numerous European bodies. The first was the European Recovery Programme in 1947 (ERP), and the second was the Brussels Treaty of 1948.

The European Recovery Plan was popularly known as the Marshall Plan, as it was the result of the invitation made in 1947 by Mr. Marshall (then U.S. Secretary of State) to the European countries to draft a programme to put Europe on her feet economically. The U.S.A. was ready to give this aid if the countries concerned would agree on co-operation and plan their needs. In March 1948 the countries concerned created the Organisation for European Economic Co-operation (OEEC) to administer the programme of aid, and this body is described below.

The Brussels Treaty, 1948, was the other main source of the West European organisations. In March 1948 Britain, France, and the Benelux countries (Belgium, Holland, and Luxembourg), agreed at Brussels to pursue a common policy on economic, political, and military collaboration, and to promote a better understanding of the principles which form the basis of the common civilisation of Western Europe. It also provided for the creation of a Consultative Council. This Council, when formed, was the Council of Europe, and it is described below, together with an account of all the organisations which stemmed from the Treaty. Italy and the German Federal Republic joined the Brussels Treaty Organisation in May 1955, which then became the Western European Union.

2. Military Organisations.

The Brussels Treaty and the Western Union Defence Organisation.—As we have seen, under the Brussels Treaty, so far back as 1948, the five Western Powers concerned pledged themselves to military collaboration; and in the same year they formed the Western Union Defence Organisation. At that time policy was being framed by a fear of a revival of German aggression. But in time this fear was replaced by distrust of the Soviet Union. There were two developments. In the course of seven years the Western Union Defence Organisation was transformed by the inclusion of the German Federal Republic itself and of Italy into a larger body called the Western European Union. How this change came about is described in the following paragraphs, which tell the story of the creation of the new Federal Republic of Germany, the proposal for a European Defence Community (which did not materialise), and the eventual emergence of Western European Union (in 1955). The second sequel of a military character of the Brussels Treaty was the creation of the North Atlantic Treaty Organisation (NATO). Whereas WEU is a regional organisation, NATO has an even larger range, as its members include Canada and the U.S.A. An account of NATO follows the story, to which we now turn, of the emergence of the new German Republic and its eventual incoporation in WEU.

Government of Germany after the War.—As a result of Germany's unconditional surrender on June 5, 1945, all power in Germany was transferred to the Governments of the four principal Allies. By decisions at Potsdam in 1945 that power was exercised by the Commanders-in-Chief of the U.S.A., the United Kingdom, the Soviet Union, and France, each being responsible in his own zone of occupation. On matters affecting Germany as a whole, the four would be jointly responsible as members of the Control Council. Berlin was divided into four sectors of occupation.

The London Conference 1947 of the four Foreign Ministers concerned failed to agree on a joint German settlement. Unfortunately, the effect was to set in motion political and economic developments which were speedily to make Germany the battleground of the conflict of ideas between Soviet Russia and the Western Powers. The Allied Control Council could no longer function efficiently; and by the end of 1948 four-Power rule had virtually collapsed and the partition of Germany was complete. A federal Parliament and Government were formed in Western Germany. The Soviet zone prepared a rival form of Government for East Germany.

Western Germany's New Status.—In May 1952 the German problem acquired a new complexion, when the so-called "Contractual Agreements" were signed by the three Allied Powers and Western Germany at Bonn. These Agreements did not form a Peace Treaty, but they attempted to define how W. Germany and the three Allied Governments should work together. Sovereignty was to be restored to Germany and she was to enter a military alliance with France. Indeed, a Treaty called the European Defence Treaty was drawn up between the four Powers, with Italy and the Benelux countries, which was to fit German Armed Forces into a Western European system. But this system, called the European Defence Community, never came to fruition as such, owing to the refusal of France to ratify the Treaty in 1954.

Collapse of EDC.—With the collapse of EDC there was a halt to the idea of a Political Community designed to embrace both the proposed EDC and the existing European Coal and Steel Community. It was logical that these two Communities formed by the same countries should not have separate institutions but should take their place within a single political community.

The London Nine Power Conference and the Paris Agreements, 1954.—Nine Powers met in London to devise a substitute for EDC. They were Belgium, Canada, France the German Federal Republic, Italy, Luxembourg, Netherlands, United Kingdom, and the U.S.A. The Conference considered how to assure full association of the German Federal Republic with the West and the German defence contribution. All the decisions which were reached formed part of one general settlement and these were embodied in agreements signed shortly afterwards in Paris. These decisions included the following:—

1. The occupation of W. Germany by Great Britain, the U.S.A., and France should end.
2. The German Federal Republic and Italy should join the Brussels Treaty Organisation.
3. The W. German Republic was admitted to the North Atlantic Treaty Organisation (NATO).

Western European Union.—These agreements took effect on May 5, 1955, when the occupation régime in Western Germany ended and the Republic attained full sovereignty and independence. At the same time the Republic became a member of the Western European Union (the expanded Brussels Treaty Organisation), which came into formal being on May 5, 1955, and also of NATO, to which we now turn.

The North Atlantic Treaty, 1949.—The founder members of this Pact (which widened the scope of the Brussels Treaty) were Great Britain, the U.S.A., Canada, France, Holland, Belgium, and Luxembourg. The parties agreed that an armed attack against one or more of them in Europe or North America shall be considered an attack against them all and consequently they agreed that if such an armed attack occurs, each of them, in exercise of the right of individual or collective self-defence recognised by the Charter of the UN, will assist the party so attacked.

3. Political Organisations.

Federal Union.—The development of greater political unity among the European countries

may be best introduced by a word about the federalists. The Federal Union had, before the War, urged a federation of Europe as a first step in a progression towards a world federation. The Federalists advocated the surrender of absolute national sovereignty, a part of that sovereignty being vested in a federal authority. This authority, it was urged, should possess a government responsible to peoples and not to the States. It should have a Supreme Court to settle disputes between States which are members of the federation; and have an armed police force to uphold its decisions.

The Hague Congress, 1948.—Several schools of thought were represented at the Congress, one main difference being between the federalists, who want to create a real federation in Europe, and those, like the United Europe Movement, who were not committed to a federation in so far-reaching a sense. The Congress declared that the European nations must transfer some part of their sovereign rights so as to secure common action, and it demanded an early convening of a European Assembly chosen by the Parliaments of the participating nations.

The Creation of a Council of Europe.—In May 1949 the Foreign Ministers of the ten countries consisting of the five Brussels Treaty Powers and Denmark, Eire, Italy, Norway, and Sweden, concluded a formal Agreement called "The Statute of the Council of Europe." It set up a Committee of Ministers and a Consultative Assembly, forming together a Council of Europe. The Council was established twelve months after the Hague Congress, almost to a day. The Committee of Ministers provides for the development of co-operation between governments, while the Consultative Assembly provides a means through which the aspirations of the European peoples may be expressed. The seat of the Council was fixed at Strasbourg.

Council of Europe.—The Council came into existence in August 1949, and the Assembly opened at Strasbourg when M. Spaak was elected President. Mr. Churchill (as he then was) sat as an ordinary member. Procedure is a combination of British and Continental systems, but the design of the chamber follows the Continental pattern, delegates sitting at tables arranged to form a semi-circle. In November 1949 the Council of Ministers agreed to meet the wishes of the Assembly that it would not in practice exercise its right of control to fix the agenda of the Assembly.

The Consultative Assembly.—This, the deliberative organ of the Council, is empowered to debate and make recommendations upon any matter which: (i) is referred to it by the Committee of Ministers with a request for its opinion, or (ii) has been approved by the Committee. The Assembly consists of representatives of each member state appointed in such a manner as the government of the member shall decide. All resolutions of the Assembly require a two-thirds majority of the representatives casting a vote. The Assembly meets annually.

Limitation of the Assembly's Powers.—One group of representatives wished a complete change of the Assembly's powers in order to transform the present consultative and deliberative organisation into a legislative body. During the second session of the Assembly (in August 1950) a British delegate submitted a plan, which was not accepted, for a basic revision of the statute so as to give the Assembly a political authority endowed with limited functions but real powers.

Towards a European Parliament.—This is the title of a book of great interest published by the Council of Europe in 1958 and written by Mr. Kenneth Lindsay, who has worked for the cause of European Unity for many years. (The book is obtainable from H.M. Stationery Office.) Reference is made in later paragraphs to some of Mr. Lindsay's general comments on the British attitude to European organisations; but we deal here with some of Mr. Lindsay's views on the Council of Europe. He raises three separate issues:—

(1) the responsibility of Ministers to respect the feelings of the Assembly and to present Reports in person;
(2) whether members speak for themselves in an individual capacity or for a national delegation or a party; and
(3) the relations between the Assembly and national parliaments.

The Responsibility of Ministers.—The writer thinks that the Council of Europe would undergo a much-needed blood transfusion if there were a better attendance of Ministers at Assembly debates and if the Assembly could count on the presence of leading statesmen from Opposition parties. Unfortunately there is a ceaseless cold war between the Assembly and Ministers. Scores of recommendations and resolutions by the Assembly are made with no tangible result. It is true that some attempt has been made to smooth relations between the two sides of the Council by means of a Joint Committee. But Mr. Lindsay thinks it should be possible for the rotating chairman of the Committee of Ministers or a substitute to attend Assembly debates at least twice a year. Mr. Lindsay claims that the Assembly debate on the Rapacki "disengagement" plan, which proved to be a fair summary of European opinion, would have gained in public notice and in significance if a Minister had been present.

The Responsibility of Members of Assembly.—The Assembly comprises over two hundred individual members of Parliament from fifteen different countries. As already explained, these members are appointed by Governments in such a manner as each Government chooses. Although they are entitled to group themselves on any particular issue if they choose, a member is in particular relationship to his country and his party or even to his constituency. There is therefore a position of some confusion and subtlety. Meanwhile the success of the Council depends upon those who can rise above party and country and express a European outlook.

Relations with National Parliaments.—The attempt made by the Joint Committee between Ministers and the Assembly to act as an organ of co-ordination between the two sides of the Council has not satisfied the Assembly. It has therefore set up a Working Party to analyse the relations between the Assembly and national parliaments. This Party tries to see what steps can be taken in each national parliament to secure consideration of recommendations and ratification of Conventions which have been approved at Strasbourg. They have gone so far as to appoint a spokesman for each country.

What Has the Council of Europe Achieved?—The Council plays an important part in law-making. It has itself framed and launched important Conventions like that on Human Rights, and it also frames general principles and gives opinions on texts of laws. On the diplomatic side it prepared the way for a solution of the Saar problem, which had divided France and Germany since the War. It is working on the simplification of frontier formalities, and it is concerned (in common with several other international bodies) with refugees. Among other actions, it has encouraged the growth in reciprocity between countries of their social services, and established a European Court of Human Rights.

4. Economic Organisations.

The Organisation for European Economic Co-operation (OEEC).—We now turn to the third stream, the economic. We have seen that OEEC was created to administer American (Marshall) aid. But it needed also to re-create a sound European economy. The allocation of aid continued until

1952; but the practice of mutual consultation on economic matters has continued in order to carry out long-term programmes. OEEC is situated in Paris, and is an intergovernmental organisation, being a conference of sovereign states in permanent session. Owing to the nature of its original task of distributing Marshall Aid, the U.S.A. and Canada became associate members of the Organisation.

European Coal and Steel Community.—A further economic development came in 1950 with the proposal for the co-ordination of coal and steel production in Germany, Belgium, France, Italy, Luxembourg, and the Netherlands. The High Authority of the Community which began its work in 1952 includes a consultative Committee of representatives of management, labour, and consumers, an Assembly of Parliamentary delegates, a council of Ministers as a link to the governments, and a Court of Justice to settle disputes. The organisation of the Community is an example of co-operation on a supra-national basis, since the governing authority is not responsible to the individual governments of member countries but only to the Community. The High Authority has the right to deal directly with the coal and steel enterprises of the Community without passing through national governments. The plan caused great discussion between the two opposing points of view within the European Movement: the Federalists and the Functionalists. The latter advocate integration by specific conventions, and the former aim at a European parliament and government. Great Britain declined to join an association which went beyond intergovernmental co-operation; but in 1954 she formed a Standing Council of Association with the High Authority for consultations on coal and steel and for co-ordination where necessary.

What ECSC Has Achieved.—The Community has achieved a common market for coal, iron ore, steel, and scrap within the six countries and has eliminated tariffs, quotas, and other restrictions. It has also promoted the interests of coal and steel workers and has provided for the free movement of labour. But the Community's success in economic integration is only a part of its importance. Its further importance is in the surrender of national sovereignty in certain spheres and the creation of an authority which, as explained, is not responsible to the governments of the six countries which belong to it.

The European Economic Community (EEC), or Euromarket.—In 1955 "the Six" (namely the countries in ECSC) decided to drive towards further economic integration. This decision was taken at Messina, and the six are sometimes referred to as the Messina Powers. The EEC was established by a Treaty of Rome in 1957 and is an extension to the whole economic field of the institutional method of co-operation already adopted in the European Coal and Steel Community of the Six. The principal institutions are the Parliamentary Assembly (which is common to EEC, ECSC, and Euratom), a Council of Ministers, and an executive Commission of nine members. The common Parliamentary Assembly is now called the European Parliament. The Community is merging the Six into a single economic unit by harmonising economic, social, and investment policies and establishing a common market in trade.

What is a Common Market?—A common market is a trading area with no internal tariffs (import duties) or quotas (which are quantitative restrictions on imports) and a single external tariff and quota structure. The first tariff reductions inside the Six (10 per cent.) took place on January 1, 1959, and a further 10 per cent. reduction was due on July 1, 1960. The whole process will take from twelve to fifteen years. The common external tariff is being worked out. The levelling which will begin in 1962 will mean reductions by France and Italy in their high tariffs while the rest raise theirs.

A European Free Trade Area.—When the Six were discussing the Common Market the British Government declared (1956) that they would consider joining a free-trade area in Europe. Although she would not join the Common Market scheme itself, she would consider sharing in the stage-by-stage reduction of inter-European tariffs on all non-agricultural goods. They would not attempt (unlike the Six) to standardise their own tariff walls in relation to the world outside the European free-trade area. Such a free-trade area would be independently controlled with permanent co-ordination with EEC.

Rejection of Free-trade Area.—In November 1958 France rejected the British proposals for linking the six European common-market nations with the eleven other OEEC countries in a free-trade area. Under the proposal the EEC would have been linked, as a single entity, with an area which would cover all eleven OEEC countries. It was said that the principal obstacles were wide differences of social-service charges and the lack of equality of customs tariffs applied by the countries concerned. It appeared to the French impossible to establish a free-trade area between the six treaty powers and the other eleven OEEC countries without a single customs tariff between all of them and the outside world and without measures of harmonisation in the economic and social sphere.

The European Free Trade Association.—Thereupon seven countries outside the area of the Six formed a European Free Trade Association. They were Great Britain, Austria, Denmark, Norway, Portugal, Sweden, and Switzerland, and they agreed upon a plan at Stockholm in November 1959. Inside the free-trade area comprising these seven countries it is contemplated that there will eventually be no internal tariffs or quotas, but member states will retain separate external systems. The Association will function by intergovernmental co-operation, with a minimum of special institutions. It is intended to align internal tariff reductions with those of EEC. Thus it was decided to make a first reduction of 20 per cent. on July 1, 1960, when the Six was due to make its second 10 per cent. reduction. This reduction will be followed by periodical cuts, the transitional period ending in 1970. The difficulty of working the scheme with differing external tariffs is being surmounted by requiring certificates of origin for imports. This prevents imports flooding the whole area through the country with the lowest external tariffs for a given commodity.

Effects of the Free Trade Association.—The Stockholm agreement offers some safeguard to the nations concerned against being left economically isolated on the fringe of the common market. It might conceivably hasten the day when all of Western Europe is brought together in a single economic system. It created a single market of 88 million people; but there are 160 millions inside the European Community of the Six. There would be 250 millions inside a Europe-wide free-trade area. Britain stands to gain comparatively little by the removal of the low tariffs in Scandinavian countries compared with the benefits following freer entry in to France and Italy. All seven countries do more trade with the Six than with each other; all have an equal interest in ending the division of Europe into two rival trade groups.

Sixes and Sevens.—The Seven, upon the foundation of their Association, immediately offered friendly co-operation to the existing Common Market. But the problem of finding a political link—called by the diplomatists the problem of the three half-crowns (seven and six)—remained a difficult one. It was thought that the Outer Seven, by showing that a loosely-knit free trade could be made to work smoothly, might dispel some of the scepticism behind the French rejection of the original OEEC plan, as described above. On the other hand, of course, Europe is now split into two opposed trading groups. Although France was the stiffest

opponent of a wider agreement, she does a relatively small trade with the Outer Seven. The effect on Germany will be more serious.

The Remaining Five.—What about the other five members of the eighteen-nation organisation for European Economic Co-operation? They are Greece, Iceland, Ireland, Turkey, and Spain. They are "developing countries," not having highly industrialised, diversified economies, and the state of their economies did not permit them to join either EEC or EFTA unless special arrangements (*e.g.*, a longer time-limit for the reduction of customs duties and quota restrictions) were made. Greece and Turkey were seeking, in 1959, associate membership of EEC; and Finland sought affiliation with EFTA.

A New Global Grouping of Industrial Nations.—A conference held in Paris in January 1960 was expected to lead to the eventual replacement of OEEC by a much larger grouping. Certain Commonwealth countries, Japan, the U.S.A., and certain European countries would be members. The object would be two-fold: to enable the "have" countries to prevent trade wars between each other and also to co-operate closely in helping the "have-not" countries. As explained above, OEEC was originally set up to handle Marshall Aid, and Great Britain was the chief architect of it. Great Britain had also looked to OEEC as the appropriate framework to contain an eventual merger of the Six and the Seven into a wider European Free Trade Association. It was hoped that if a new Council were formed it would be given the task of co-ordinating the aid by Western countries to under-developed countries, and it would thus be realised that aid and trade policies could not be kept in watertight compartments. Under-developed countries need our markets as well as our money; and this realisation would lead to a lowering of European tariffs towards the rest of the world.

Economic Commission of Europe.—As explained in the preceding outline of the UN, ECE was the first of the great regional commissions to be set up by UNO. It was created in 1947 to concert action for the economic reconstruction of Europe, and it was hoped to strengthen economic co-operation between all European members of UNO. Russia and some of the Communist Eastern European countries are members of ECE, and it is the only European organisation where the Western bloc and Soviet powers can meet for discussion and action.

Euratom.—The six countries which proposed the Common Market also discussed the creation of a European organisation for the peaceful uses of atomic energy. Euratom, as it is called, has prior claim on any uranium, plutonium, or thorium in member countries and would distribute it to atomic-energy establishments without discrimination. In the event of deficiency materials are allocated on needs. The institution of Euratom is dealt with in the Treaty of Rome establishing the European Economic Community.

5. Proposals for Simplification.

There are now in Europe almost as many "Unifying" bodies as there are countries to unite. Six major organisations, still more minor ones, and three parliamentary assemblies are all engaged on aspects of the task of building a United Europe. At least four cities, each housing one of the major organisations, can aspire (should they desire this honour) to become the "capital of Europe." There is inevitably some overlapping. Thus Western European Union and the Council of Europe are both competent for social and cultural questions. OEEC and the Council are both interested in economic questions. At the moment there is not "one Europe" but the Europe of the Six (coal and steel community, common market, Euratom), another Seven in EFTA, the Seven in WEU, the Fifteen (the Council of Europe) and the Eighteen (OEEC).

Britain's "Grand Design."—In 1956 Great Britain suggested a single European Assembly where all aspects of Western co-operation could be reviewed. This would have the merit of concentrating in a single place organisations whose centres are at present in various capitals. This European Assembly would have five Commissions, political, economic, social and cultural, legal, and administrative. The "Grand Design" suggests more effective political consultation in NATO and WEU; and it further suggests the better linking of European unity in an Atlantic community. But the Assembly would need to cover in some way organisations of differing concepts and differing membership. This central difficulty has been faced by a proposal for two Assemblies to take, respectively, the intergovernmental and the supranational institutions—the Council of Europe, WEU and OEEC being in the former category and the institutions of the Six in the other. Another difficulty is that some countries are ready to join other countries in economic matters but not in military.

Other Proposals.—Another proposal is to link OEEC (which has no Assembly) with the Council of Europe (which is primarily an Assembly). Members of the Assembly of the Six might also be the members of the Assembly of OEEC which would become the Economic Assembly of Western Europe. In a similar way a fusion has been suggested of NATO and WEU to form a general defence assembly. This proposal was advocated in an excellent pamphlet published by PEP (Political and Economic Planning) in 1957.

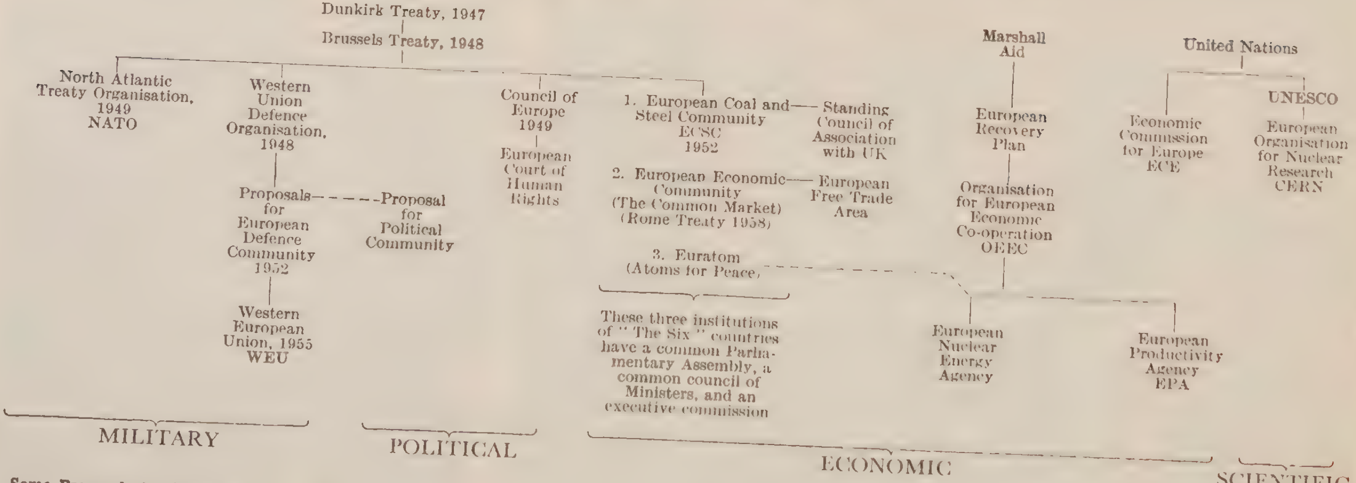
First Attempts at a Solution.—No real attempt to get to the root of the problem was made before 1959 when the Committee of Ministers (Council of Europe) set up an *ad hoc* Committee on Rationalisation. On a first report the Ministers took their first decisions: to propose to the Governments that the exercise of the competence in the social and cultural fields of WEU be transferred to the Council of Europe. But the Assembly of the Council did not think this was going very far. They urged, in addition, that the process of merging the Council with OEEC should begin immediately. The admission of Spain to OEEC posed a problem which it was thought could be met. The debate, however, revealed that the universal agreement on the necessity of rationalisation fades when it comes to discussing the concrete measures required to put the idea into practice. The subject was due to be discussed again in January 1960.

The Special Position of Great Britain.—This country, although a European country, is in a special position, being already in two other orbits. She belongs to the British Commonwealth, and half her trade is with the Commonwealth, a quarter being with Europe. She also has strong links with the U.S.A. For these reasons this country has been unwilling to join in supranational organisations. An exception in practice has been the transfer of the command of Britain's national forces to the NATO supreme commander.

6. Can European Union be Effective?

The Comparative Failure to Establish an Effective Form of European Union.—This failure was discussed in Mr. Kenneth Lindsay's book *Towards a European Parliament* already referred to. He regards as the two main causes of this failure the inadequacy of British leadership at every stage in the growth of European organisations and, secondly, the proliferation of organisations. Britain, he says, could have become the architect of a united Europe without in any way injuring Commonwealth trade or her special relationship with the U.S.A. "At each successive step forward," he writes, "whether in the case of the Coal and Steel Community, EDC, the still-born Political Community, the Common Market or Euratom, the British have done two things. They have welcomed the steps taken and then put forward a succession of proposals to counterbalance them.

GROWTH OF WESTERN EUROPEAN ORGANISATIONS



Some Proposals for Simplification.

1. Proposal for a single European Assembly with five Commissions, in a "Grand Design." Proposal made by United Kingdom.
2. Proposal for two Assemblies to take respectively the intergovernmental and the supranational institutions. The Council of Europe, WEU and OEEC are in the former class; and ECSC and other institutions of the six countries concerned are in the latter class.
3. Proposal to link OEEC (which has no Assembly) with the Council of Europe (which is primarily an Assembly); to make OEEC the Economic Assembly of Western Europe (the members of the Assembly of the Six being also members of an Assembly of OEEC); and to fuse NATO and WEU in a general Defence Assembly.
4. Proposal to merge the defence functions of WEU with NATO and its other functions with the Council of Europe; then to merge the Council of Europe with OEEC to create a "European Union" for Greater Europe (Mr. Kenneth Lindsay).

MEMBERSHIP OF EUROPEAN ORGANISATIONS
(M is full membership, AM associate membership)

	Military		Economic				
	NATO.	WEU.	Council of Europe.	OEEC.	ECSC. Euratom, and EEC.	EFTA.	ECE.

Notes: All the countries are members of UNO except Western Germany and Switzerland. The U.S.S.R. and other Eastern European countries are also members of ECE.

* The United Kingdom is associated with ECSC through a Standing Council of Association.

HOW THE AMERICAN CONSTITUTION WORKS.

The following outline describes how the American democratic system works and how it differs from our own.

A Written Constitution.—The Government of the U.S.A., unlike Great Britain, works upon a written Constitution. It was framed when the U.S.A. came into existence as a sovereign body, when the Constitution built a republic out of a federation of thirteen states, based on representative government. The constitution was adopted in 1789, and its strength has been tested by the fact that, substantially unchanged, it is now the groundwork for a federation which now comprises forty-nine states (Alaska having been admitted in 1958 as the Forty-ninth State) and with a population forty times greater than in the original federation. Only twenty-two amendments to the constitution have been approved over the years, and none touch basic principles. The main design of the constitution is the division of power into three branches—the legislature, the executive, and the judiciary—each branch limited so that none could rise above the other and the three co-ordinated and balanced. This division is known as the separation of powers; and an explanation of it is offered towards an understanding of American politics. Let us look at the three branches.

National Congress.—All legislative powers are vested in Congress, which consists of a Senate and a House of Representatives. In the Senate each of the forty-nine states has two representatives, and in the House of Representatives there are 436 members based upon the population in each state. Senators hold office for six years (one-third of them being elected in elections in every even-numbered year), and members of the House of Representatives for two years. Bills may be introduced in either House or Senate except revenue measures, which must originate in the House of Representatives. The two Houses have almost the same authority in the making of laws, and the Constitution lists eighteen subjects (including the declaration of war), on which Congress may make laws, all other law-making power being left to the States. Congress is forbidden to do six things, and these include the suspension of *habeas corpus*. Differences between the two Houses are referred to specially appointed conferees, and when agreement is reached the measure is sent to the President for approval or disapproval. If he approves and signs, the measure becomes law. And it becomes law, even without the President's signature, if he should take no action on it within ten days, while Congress is in session. If the President should veto the measure and send it back, Congress may enact it into law over the President's objections by a two-thirds vote of members present, each chamber of Congress voting separately. So Congress has both the first and last word on all legislation. President Truman is said to have made more frequent use of the veto than any of his predecessors in office. A number of them were overridden by Congress. As a result of the Congressional elections of November 1958 the House of Representatives comprised 283 Democrats and 153 Republicans and the Senate 64 Democrats and 34 Republicans. Let us turn now to the President, in whom executive power is vested.

The President.—Despite the example before them of the danger of the excessive power of a British king, the framers of the Constitution decided to give all executive power to a single official to be known as President of the United States. It does not give any executive power to the Vice-President (who presides over the Senate) or to other officials. The President is thus his own Prime Minister, an actual ruler who nominates the Cabinet Ministers who are responsible only to him. The President lives in the White House at Washington, and heads the Executive Departments, each under a Cabinet member, and also many independent agencies. He is elected for four years through indirect election (as described below) by the people.

How Presidents are Chosen.—Candidates are chosen at conventions held by the principal political parties in the summer of election year. After every State delegation has had an opportunity to offer the name of its candidate, the delegates vote for their choice. A candidate having been thus selected by each party, the Presidential election takes place in the following November by an "indirect method." By this method the voters of each state select Presidential electors equal in number to the Representatives and Senators which that State has in the Congress. These electors are nominated by the political parties for the sole purpose of voting for their party's candidates for President and Vice-President. The electors from all forty-nine states are known as the Electoral College. The Federal Electoral College does not actually meet, the electors of the college meeting each in their own state. All the state's delegates vote for the candidates (for President and Vice-President) of the political party which has a majority, however small, in the state.

Congress and Foreign Policy.—The President shares with Congress responsibility for foreign policy. The initiative in the conduct of foreign relations rests with the President, who acts also as the nation's principal spokesman on foreign policy. He points the path to be followed. Notwithstanding this Presidential prerogative treaties can be made only with the approval of the Senate; and to the extent that foreign policy requires money and possibly laws, Congress as a whole has the final voice in determining what foreign policy should be adopted. When President Truman sent U.S. troops to Korea in 1950 he had to assume that Congress would support him, which it did. President and Congress work well together and serious conflicts seldom arise. Perhaps the most dramatic and important instance of the Senate saying "No" to a Presidential policy was its refusal to approve the Treaty of Versailles after the First World War. Put briefly, the President is the country's principal spokesman on foreign affairs, but Congress can assert its final authority in this field as in domestic legislation.

"Checks and Balances."—We have thus seen that both in legislation and in foreign policy Congress can profoundly influence and, if sufficiently determined, can dictate the course of national policy. De Tocqueville, who wrote a classic study of *Democracy in America*, 1835, said: ". . . the struggle between the President and the legislature must always be an unequal one, since the latter is certain of bearing down all resistance by persevering in its plans." The British Ambassador, James Bryce, said that although the Constitution gave the President substantial powers of his own there is scarcely one of these that the long arm of legislation cannot reach. To sum up, the "checks and balances" between President and Congress work both ways. Congress can check the Executive in foreign affairs. The President can veto the legislation of Congress. Congress can then countercheck and over-ride the President. So the President leads but does not rule. Most Presidents of the past fifty years—from Theodore Roosevelt to Eisenhower—have acted on the assumption that the President carries a mandate from the country, with a responsibility for leadership. The relationship between President and Congress gains added interest by the anomaly that, from November 1958 to the Presidential Election in 1960, both Houses of Congress had Democratic majorities, whereas President Eisenhower was of course, a Republican.

The Third Branch of Government: the Judiciary.—The courts act as a check on the other two branches—Legislature and Executive—by deciding whether one or the other has tried to use more authority than it has been given; and it decides whether, as between the national or the state governments, one side or the other have gone beyond their powers. The Supreme Court is the highest court, and could not be abolished without amending the constitution which created it.

The Bill of Rights specifically guarantees certain freedoms which the first Congress did not think adequately covered by the articles of the Constitution itself. These freedoms include that of religious worship, of speech, the Press, and peaceable assembly, and guarantees against unreasonable search of persons and houses.

The State Governments.—In the governmental pattern the State units occupy a special position. After all, the first thirteen of them had been operating for some years under written constitutions before the Federal constitution had been created. The constitutions of the states differ in some detail, but have a similar pattern; and they all provide that the final authority in the State belongs to the people. The line of demarcation between the respective powers of federal and state governments is drawn in the federal constitution. One of the requirements imposed on states is that their governments must be republican in form, and they may adopt no laws conflicting with the constitution, laws, or treaties of the federal government.

Changes in the Constitution.—The authors of the constitution were aware that changes would be needed from time to time to keep pace with the growth of the nation. But they wanted to ensure that such a change would not take place without mature consideration; and, at the same time wanted to prevent a minority being able to block a desirable change. So they devised a variety of ways by which the constitution could be amended. There have been twenty-two amendments to 1960. The first ten amendments are called the Bill of Rights, which is the subject of the next paragraph. The 18th amendment prohibited the sale of intoxicating beverages and was repealed by the 21st amendment. The 19th amendment gave women the right to vote.

The Committees of Investigation.—The accusations brought by Senator McCarthy in 1950 against a large number of government employees brought the Senate Committees, which investigated the charges, into great prominence. There is no provision in the Constitution for congressional committees, but precedents go back earlier than the constitution itself. Congressional committees have inquired into many matters over the years and the authority to investigate has been upheld when it could be shown that investigation was in the public interest and related to the power to legislate. Legislative investigators receive special prominence because they can be broadcast and televised, whereas the formal proceedings of House and Senate are not. Of course, this kind of committee is only one of the many kinds who prepare and "pre-consider" federal legislation. There are standing committees of each house and joint committees.

The Republican Party was born by the fusion in 1854 of the group who called themselves National Republicans, having split from the Democrats over tariffs in 1825, and the northern Democrats, both of them being opposed to slavery. It came to power on Abraham Lincoln becoming President in 1861 and remained in power (with the exception of four Administrations) until 1912. On coming to power in 1920 the Republicans withheld the U.S. ratification of the Treaty of Versailles, which had been negotiated by Woodrow Wilson. It was defeated in 1932 largely as a result of the economic depression. Once isolationist in foreign policy, the Party now advocates an active policy, especially in Asia. The symbol of the party is an elephant.

The Democratic Party, one of the two great parties, originated about 1787, advocating restrictions on the federal governments and in opposition to the federalists. It was in 1825 that a group who were in favour of high tariffs seceded, and this group was to become the Republican Party. The Democratic Party was split again over slavery before the Civil War (1861–65), and in the main

the southern states have been supporters of the Democrats. There was a Democratic President for twenty years, ending in 1953, when Eisenhower, the Republican Party candidate, became President. Eisenhower succeeded at both the 1952 and 1956 elections. The Democrats included in their last election programme a federal development of hydro-electricity and measures to prevent unemployment.

ISSUES OF THE DAY.

The following paragraphs contain background information on four selected controversial issues:—

The Younger Generation.

Capital Punishment.

The Wolfenden Committee and Homosexuality.

The Expansion in World Population.

THE YOUNGER GENERATION.

Is the Gap between the Generations Widening?—There always exists a gap between the generations. But is the gap at the present time wider than it has been? Is it wider than it ought to be? Do adults fail to understand the young? Do the young reject the standards of adults? What is the truth about the increase in delinquency? What are the difficulties and the aspirations of the young? Is it the young who are changing, or is it the world, or is it both? What can adults do? These are very important questions, because the burden of decisions tomorrow will fall on today's young.

Who Are the Young?—They are the young men and women between the ages of fifteen and twenty, and there are 4 million of them. They were born in and between 1939 and 1944, war years which were specially difficult for the rearing of children, and many of the young people were educated in overcrowded classrooms. In two to four years time the position will have changed. There will then be a million more between fifteen and twenty owing to the bulge in the post-war birth-rate. There will be shortly, therefore, more teenagers than at any time since the First World War.

What is New about the Present Younger Generation?—First, it is comparatively well-off. The average weekly wage packet of the male teenager in 1959 was £5 14*s*. and for girls under 18, £4 7*s*. 4*d*. The young have not only shared in the general advance of wages but have done relatively better. Further, the teenager today hands over a smaller proportion of his earnings than the teenager of twenty years ago, partly because parents are now more prosperous. Something like £500 million annual purchasing power are in the hands of the young. Another new fact is that the young are now more mature than heretofore. Better food and medical care have made them healthier, and they reach physical and sexual maturity earlier. A century ago girls reached puberty at 17; it is now generally at 13; in twenty years it may be as early as 12. Taken together, these two changes have helped to make another change: there are earlier marriages. One in four of all young women marry at 19 or earlier; and one in twenty of young men of the same age. Before the War the comparable figures would have been 1 in 9 of the young women and 1 in 50 of the young men. Beyond these dramatic changes is the changing world created by adults—the cinema and television, the special periodicals which adults produce for the young, and the goods specifically designed for them.

Delinquency.—In a White Paper published in February 1959 (*Penal Practice in a Changing Society*), attention was called to the increase in convictions of young men aged roughly 16 to 21 for offences of all kinds. This was an aspect of the persistence of crime which had increased during the War. This aspect naturally receives great publicity in the Press. But it should not blind us to the central fact that only a very small fraction—something under 2 per cent.—of young men are affected and that 98 per cent. of young people are sound.

The Education of the Young.—Unfortunately 80 per cent. of all young men leave school at 15. For a very long time it has been generally agreed that two advances were essential: to raise the school-leaving age to 16 and to introduce compulsory part-time education up to the age of 18. It is still so agreed. Indeed, powers exist in the Education Act of 1944 to do both these things. Unfortunately, although, sixteen years have elapsed, the powers have not been used. And they are unlikely to be used in the next few years unless there is energetic action now, which it cannot be assumed that there will be. There has, however, been some increase in the number of those staying on voluntarily at school after 15; and there has been a growth of day-release schemes whereby young people at work are able to attend technical colleges.

Education for Young People in the Next Twenty Years: the Crowther Report.—Recommendations on this subject were made at the end of 1959 by the Central Advisory Committee for Education (England). "We do not think," they said, "that the figure of about 12 per cent. of the age group still in full-time education at the age of 17 and of 6 per cent. at 20 is nearly good enough." They urged that the school-leaving age should be raised from 15 to 16. Many of the things that the schools can do for boys and girls can be carried much nearer completion by 16 than by 15. In their view the additional year should offer "new and challenging" courses and not simply be a continuation of what has gone before. They thought that the most favourable period for the change will be from 1965 to 1969, when it is estimated that the secondary-school population will be in a valley between two peak periods. If the change is made in 1969 it will be a quarter of a century after provision was made for it in an Act of Parliament. *See* graph (**E2**).

Further Education Proposals.—The Crowther Committee also recommended a planned programme of experiment leading to the introduction in the early 1970s of compulsory part-time education of all boys and girls of 16 and 17 not already in full-time education. This in effect would be carrying out the proposals of the 1944 Education Act on county colleges.

Youth at Work.—In the five years which will end in 1964 an extra million boys and girls will reach school-leaving age. Whether all these will find work will depend upon whether the economic expansion of the country is great enough to absorb them. During the first half of the decade 1950–60 there was an average increase of employment of 200,000 a year. But during the three years to 1958 there was a slight fall in employment. Apart from the primary need for economic expansion, a number of reforms have been urged to ensure that as many young people as possible should get skilled jobs. Among these reforms are that there should be an expansion of apprenticeship training facilities; Government emergency training centres; and a greatly improved Youth Employment Service. No more young men are being called up for National Service after 1960, so that a considerable number of additional 18–20-year-olds will be available for employment.

Exemption from National Service.—About fifty thousand men were exempted from call-up for National Service in 1960. They were the men whose deferment for training or study ended on or after June 1, 1960. Most of them were apprentices and the others included university students and those taking professional qualifications. As stated above, nobody will be called up after 1960, and men born in the fourth quarter of 1939 do not have to register.

Youth at Play.—Four out of five young people leave school at 15. The minority who remain at school (and the smaller number who go on to the University) all enjoy both the time and facilities not only for physical recreation but also for a wide range of interests. But for the great majority leisure needs are not adequately catered for. For the development of their energy and their sense of adventure and curiosity, they need better opportunities than are provided by commercial entertainment, enterprising as some of these may be. This situation is the more serious because County Colleges for compulsory one-day-a-week education up to the age of 18, as contemplated by the Education Act of 1944, have not been built. Even if they had been built, a good comprehensive Youth Service was also necessary; and, indeed, even before the Act youth welfare was officially declared to be part of the national system of education. But the Youth Service has been starved of official support and has been described as the Cinderella of the educational world. There are many excellent Youth Centres and Youth Clubs; but two-thirds of 15–20 age group do not belong to them. Thus, a challenge remains as to how to attract a much greater proportion of the young. Do not the facts warrant a nationally inspired campaign for better-trained Youth Leaders, better sports facilities of all kinds, more attractive youth centres and clubs, with dance halls, coffee bars, swimming-pools, libraries, hobbies rooms, quiet rooms, and lounges.

The National Youth and Sports Centre.—A scheme for such a centre at the Crystal Palace, London, was proposed by Sir Gerald Barry in 1954; and in 1960 the London County Council decided to go ahead with the plan. The Centre will be used for training coaches, leaders, and athletes, and for the reception and training of teams from overseas. It was intended that the centre should be for training rather than competition, but it was hoped that the scheme would be amended to make it a home for competitions—particularly indoor ones—by turning the projected gymnasium into an adaptable indoor stadium on the lines of recent buildings in Sweden, Germany, and Italy.

Youth and Marriage.—As we have said, there is a trend to earlier marriages, owing, in part, to greater prosperity of youth and to their earlier physical maturity. This means that the interval between school and marriage is narrowing. We are already accustomed to the fact of undergraduates being married; we may yet have to be accustomed, especially if the school-leaving age is raised, to seeing "children" at school engaged to be married. This suggests the need for more training in schools, not only in the physical and emotional aspects of sex but for more training for marriage and parenthood.

What the Community Owes to Youth.—The community owes them a much greater interest in their welfare. It needs to give them much better equipment and much better chances. "The restlessness of the young," wrote Sir John Wolfenden, "is, in fact, the only hope for all of us, the only hope we can have that when we have become too weary or discouraged or disillusioned they, with their vigour and uninhibited optimism, will change things for the better." A number of novel proposals have been made to stimulate better interest by adult groups in the new generation; and to encourage young people to embark upon imaginative voluntary projects. Among suggestions made have been "Adventure Scholarships" and "Second Chance" training courses. Whether the community should give the Parliamentary vote at a much earlier age, possibly at 18, is discussed on C11.

What Are "Adventure" Scholarships?—Dr. Michael Young suggested to the Labour Party Youth Commission the idea of 5,000 "adventure scholarships" of up to £500 to be awarded each year to young people between the ages of 16 and 25. The main purpose was to give opportunity for adventure to those who do not fit tidily into the educational or industrial worlds. The only qualification asked, under the scheme, is that the project proposed should be a genuine one and tha the young person concerned has the character to see it through. Over 20,000 young people have undertaken special activities under the Duke o Edinburgh's Award Scheme.

A Second Chance for Young People.—The Wa was won because so many young people, in changed circumstances, displayed unexpecte talent and shouldered more skilled and more responsible tasks than they had been accustome to. As a sequel, many ex-service men an women were trained for new careers. The question has therefore been asked whether some analogous chance should not be offered in peace time. A child may "miss the bus" at the age o 11; others may miss it when they leave school a 15. Should there not be a second chance for those who develop late or who, for whatever reason want to make a new start upon a better course, by providing them with "second chance" trainin courses?

Inquiries into Particular Problems of Young People.—A number of Committees are studyin particular problems, and these include: The Central Advisory Council on Further Educatio (1957), and the Wolfenden Committee on Spo (set up, in 1958, by the Central Advisory Counc for Physical Education). The object of the la named is to recommend measures to enable game sports, and outdoor activities to play their fu part in promoting the general welfare of th community.

Report of the Albemarle Committee on Yout Service, February, 1960.

CAPITAL PUNISHMENT.

How the Problem Has Changed in a Hundre Years.—Persons were executed for small offence against property up to 1836. In 1814 a man wa executed in Essex for cutting down a tree. I 1833 a boy of nine (Nicholas White) was sentence to death at the Old Bailey for stealing two penny worth of paint, though he was reprieved. In th ten years up to 1818, 645 people were execute for crimes other than murder. The first attemp to mitigate the severity of the criminal law ha been made in 1810, when Sir Samuel Romilly introduced a bill into Parliament for the abolition o capital punishment for stealing five shillings an over from a shop. It was defeated by thirty-on votes to eleven. Gradually, however, some progress was made. Capital punishment wa abolished for cattle, horse, and sheep stealing i 1832; soon after for housebreaking and forgery and by 1837 the capital offences had been reduce to fifteen.

Capital Offences Reduced to Four.—It was no until 1861 that the number of crimes punishabl by death were reduced to four, viz.: (1) Hig Treason; (2) Murder; (3) Piracy with violence and (4) Destruction of public arsenals and dock yards. For the latter two offences, the deat penalty has fallen into disuse.

Public Executions were abolished in England i 1868 because instead of having a deterrent effec they had become an excuse for drinking an debauchery. When the penalty for pilfering wa death, public executions were the best opportu nities for the pick-pocket to get to work amon the crowd.

Children and the Death Sentence.—It was no till 1908 that sentence of death was abolished fo persons under 16; and not till 1933 that it wa

raised to 18. This latter position was more closely defined to cover persons who were under 18 at the time when the offence was committed. The Royal Commission on Capital Punishment (whose Report of 1953 is dealt with below) recommended, by a majority that the age-limit below which a person should not be sentenced to death should be raised from 18 to 21 in both England and Scotland. But the law has not been changed.

Inquiry by a House of Commons Select Committee, 1930.—During a debate upon a resolution against the death penalty in 1929, a Select Committee was promised to confirm the facts, particularly in regard to the experience of those countries which had abolished the death penalty. The Committee considered evidence from abolition countries and from experts and officials of all kinds, including some from the U.S.A. They elicited important facts and made definite recommendations.

Facts Proved by the Investigation.—The Inquiry found the following facts proved, amongst others:—

1. That abolition had not caused an increase in murder in a single European country; in most instances abolition had been followed by a decrease.
2. That the eight states in the American Union which had abolished Capital Punishment were among the states with fewest murders in proportion to population.
3. That eminent witnesses of wide experience in the administration of justice held that in spite of all our safeguards there was real risk of executing an innocent man.
4. That with the existing state of law and practice there is a real danger of executing a person of abnormal mentality.

The Select Committee's Report, 1930.—By a majority the Committee recommended that Parliament should, in the current Sessions, pass an Act to abolish the penalty for an experimental period of five years in cases tried by Civil Courts in time of peace; and that, in the meantime, the Home Secretary should recommend a reprieve in each case of a death sentence. (One of the minority later became an abolitionist.) But a Bill for suspension for an experimental period of five years, introduced in 1933, got no further than a first reading.

The House of Commons Declares Twice in Favour of Suspension.—Five years later, in 1938, the Commons carried a motion providing for suspension for five years, by 114 votes to 89. The Government refused to give effect to it. Ten years later, during a debate on the Criminal Justice Bill, 1948, the House, in a free vote, again declared itself in favour of suspension for five years, the voting being 245 to 222. But the Lords threw this particular clause out. Eventually the Government decided to appoint a Royal Commission, but its terms of reference prevented it from considering abolition itself, since it was authorised only to consider "whether liability . . . to suffer capital punishment for murder should be limited or modified". But the recommendations of the Royal Commission, if put into force, would considerably limit the imposition, as well as the execution, of the death penalty. If the most important recommendations were to be rejected, the Commission concludes, "that the issue is now whether capital punishment should be retained or abolished."

The View of the Royal Commission, 1949–53.—As we have said, this Commission was precluded by its terms of reference from recommending abolition. But it made the following declaration: "There is no clear evidence in any of the figures we have examined that the abolition of capital punishment has led to an increase in the homicide rate, or that its reintroduction has led to a fall." All the recommendations which the Commission made were designed to restrict the use of the death sentence.

The "Truce" Period in England.—There was a period in 1948 when capital punishment was not enforced, and it is sometimes referred to as the period when it was "abolished." It came about in the following way. In April 1948 the House of Commons, as explained above, passed a clause to the Criminal Justice Bill suspending the death sentence for five years. Thereupon the Home Secretary announced that he would reprieve all murderers, in view of their decision. But the Lords threw out the clause in June, and in July the Bill became an Act (without the clause suspending the penalty). So the original position was restored. In fact, all murderers were reprieved until November 18, so there was a period of seven months without executions. The claim which has sometimes been made that there was a significant increase in the murder rate during the "truce" is not borne out by the figures. It was too short, of course, to offer a basis for conclusions. The highest monthly figure of the year was December, by which time executions were resumed. The figures were:—

January	11	July	8
February	11	August	12
March	8	September	12
April	14	October	13
May	13	November	12
June	9	December	25

Are Murders Increasing?—The annual average of murders known to the police during the decade 1940–49 was 166. The annual average for the nine years 1950–58 was 142.

Abolitionist Countries.—Among the European states which have either abolished capital punishment by law for the civil crime of murder or allowed it to fall into abeyance by a policy of reprieve are:—

Austria	Luxembourg
Belgium	Norway
Denmark	Portugal
Finland	Roumania
W. Germany	Sweden
Holland	Switzerland
Iceland	U.S.S.R.
Italy	

(The sentence has been restored for political crimes in Roumania and for political crimes in the U.S.S.R.) Capital punishment is abolished in four states of the America Union and in two others, except for murder in what is known as the first degree while serving sentence for murder in the first degree. There has been no execution in Queensland, Australia, since 1913; and there is abolition in eleven countries of South America.

Present Inquiries.—A number of official committees are currently at work on aspects of crime. They include:—

1. Committee on the organisation of criminal courts (1958).
2. Standing Committee on the revision of the Criminal Law (1959).
3. Inter-departmental Working Party to examine practicability of a scheme (put forward by the late Margery Fry) for compensating the victims of crimes of violence.
4. Departmental Committee to inquire into all aspects of Probation Service.

The Howard League for Penal Reform exists to prevent crime and to promote the constructive treatment of delinquents; and members may consult, and borrow books from, the John Howard Library of Criminal Law and Penology. Among the reforms which it has helped to achieve are the training of magistrates, the abolition of judicial sentences of corporal punishment, the abolition of solitary confinement (except as a punishment), the introduction of lectures, classes, and prison visitors into prisons, and many other reforms. It advocates the total abolition of capital punishment and publishes a good deal of valuable literature on this and other aspects of penal reform. Its address is: Parliament Mansions, Abbey Orchard Street, London, S.W.1.

THE WOLFENDEN COMMITTEE AND HOMOSEXUALITY.

The Wolfenden Committee.—During recent years public interest has been aroused by the subject of homosexuality, and the recommendations of the Wolfenden Committee are being increasingly discussed. This Committee was set up by the Conservative Government in 1954, to consider what changes, if any, were desirable in the law and practice relating to homosexual offences and prostitution. Prostitution is not dealt with in these notes (which are confined to the other branch of the Committee's inquiry), and which attempt to answer some of the many questions asked upon a subject coming before Parliament and the nation for decision. Many are convinced that the law should be changed; others are equally convinced that it should not.

What is Homosexuality?—Does it affect many people? Ought it to be stamped out, and can it be stamped out? What changes have been suggested in the law, and what would happen if the law were changed? Homosexuality is not a kind of behaviour, but a condition: it is the condition of being attracted sexually by members of one's own sex. Many people have slight homosexual tendencies, but most of us are predominantly heterosexual—that is, we are attracted by members of the other sex. It is impossible to know exactly the numbers involved; one estimate suggests there are, perhaps, a million each of men and women in this country who are exclusively or predominantly homosexual. There is no exact parallel for this sexual orientation, but it might be compared with left-handedness. No one really knows what makes a man or woman homosexual. It is said that there is evidence that, in some cases, the deciding factor is inborn. Much more research is needed into causes. A large number, perhaps the majority, of adolescents pass through a homosexual phase. Many experts believe this is normal and that homosexual tendencies displayed by boys and girls at this stage of their development need not give cause for worry. But a minority of men and women are homosexual throughout their lives; and it is this minority with whom we are here concerned.

The Law.—Are homosexual acts punishable by law? If committed in private by women, no. If committed anywhere by men, yes. An attempt was made in Parliament in 1921, to prohibit homosexual behaviour between women, but the Bill was defeated; and it is very unlikely that such behaviour between women will ever be made a criminal offence in this country. As regards men, there are similar laws against homosexual behaviour in the U.S.A., Western Germany, and Commonwealth countries. In almost all other democratic countries the private sexual behaviour of consenting adults is not subject to the criminal law. There is no evidence of any increase of homosexual practices in such countries. Nor is there evidence that female homosexual behaviour is increasing in this country, where it is not illegal. Since homosexual tendencies cannot be acquired by choice, it is unlikely that there will be a significant increase or decrease in homosexual behaviour.

The Proposed Change in Law.—A Departmental Committee of the Home Office was set up in 1954 under the chairmanship of Sir John Wolfenden, and studied the evidence for three years. Its main recommendation, by a majority of 12 to 1, was that homosexual behaviour between consenting adults in private should no longer be a criminal offence. The Committee was representative of medical, legal, and religious opinion, for it included two High Court judges, two Members of Parliament, doctors, lawyers, ministers of religion, and two women. The fears about possible consequences of reform were shown in the Report to be groundless; and the most important legal distinction between "sin" and "crime" was reasserted.

An Objection.—One member of the Commission, Mr. James Adair, formerly Procurator General at Glasgow, dissociated himself from the recommendation to legalise homosexual acts committed in private by consenting males, on the ground that such conduct was contrary to the best interests of the community and could have severe effects on the whole moral fabric of social life.

The Attitude of the Churches has been largely favourable to the proposed change in the law. It received the support of the Archbishops of Canterbury and York, the Church Assembly, the Church of England Moral Welfare Council, the Roman Catholic Advisory Committee on Prostitution and Homosexual Offences, the Methodist Conference, and leaders of the Church of Scotland and the Free Churches. The recommendation for a change in the law is opposed by the General Assembly of the Church of Scotland and by the Salvation Army.

The Attitude of the Press and Political Parties.—The Press is largely favourable. It has the backing, for example, of *The Times*, the *Daily Telegraph*, and *The Guardian* among many other national papers and weekly reviews; and it has the support of the *Church of England Newspaper* and *The Lancet*. The Wolfenden proposal has not been made a Party issue. It is firmly supported by the Bow Group in the Conservative Party and the National League of Young Liberals; and by individual Members of Parliament in all three parties.

Parliament and the Proposed Change.—The proposal was debated by the House of Lords in December 1957 and by the House of Commons in November 1958. In both cases there was a fairly even division of opinion, and this division of thought cut across Party lines. In neither case was a vote taken. In both debates the Government spokesmen expressed the view that public opinion was not yet ready for such a change.

Objections to a Change in the Law: the Effect on the Young.—One fear expressed is that homosexual behaviour between adults, if it were not illegal, would corrupt young people. But interference with boys and youths would still be punished by law. The Wolfenden Report advocates more severe penalties against those who commit offences against young people. The overwhelming majority of homosexuals have no sexual interest in children. A minority of homosexuals seek partnerships with boys, just as a minority of heterosexuals seek relationships with young girls. Those who are addicted to molesting children present a difficult and tragic problem, but it is a different problem from the ordinary run of homosexuality. There is, of course, general agreement that children—both girls and boys—must be protected.

Some Further Aspects.—The present law lends itself to blackmail, since homosexuals become easy victims of blackmail. A very high percentage of blackmail cases have a homosexual origin. Victims who report this kind of blackmail are sometimes prosecuted for the homosexual behaviour which has given the blackmailer his hold over them. Another aspect is the inconsistent way the law is administered. Two opinions are therefore worth quoting. "The law is in considerable danger of being brought into disrepute, and reforms are needed," said Lord Justice Birkett. The Wolfenden Report's comment on legal practice was: "It is evident that this law does not command the universal respect of those who are charged with enforcing it."

The Homosexual Law Reform Society has been formed to educate public opinion on the subject of reform. Its Committee includes the Archbishop of York, five Bishops, and distinguished men and women in many walks of life. It publishes important literature on the subject and a book list. Its address is 32 Shaftesbury Avenue, London, W.1.

THE EXPANSION OF WORLD POPULATION.

Some surprising predictions have been made by the UN as to where and how population will expand in the remainder of the twentieth century. These probable patterns are not only interesting in themselves but they open up a variety of problems and possibilities. We therefore give below some of these predictions which have been based upon wide research.

The General Trend.—A main prediction is that world population may rise from 2,500 millions to 4,000 millions in the next twenty-five years. To understand the dramatic nature of this forecast we can ponder the fact that it took 200,000 years for the population of this globe to reach 2,500 millions, but it would take only another thirty years to add another 2,000 millions (on a low estimate). At the present rate of increase the number of human beings in the world in 600 years time would be so great that on average there would be only one square metre for each to live on. Six hundred years may seem a long time, but it is only the length of time which has elapsed since the discovery of the New World. This result cannot possibly happen. Having found the means to accelerate growth, mankind must now clearly find the means to slow down.

Increases in Different Continents.—The importance of the predictions becomes clearer when we look at the following break-up of the figures showing the estimates of population for different continents. The figures for Asia exclude the Asiatic part of the U.S.S.R., for which the figures are included in the European estimate.

Year.	Total for the world.	Africa.	North America.	Latin America.	Asia (excluding Asiatic part of the U.S.S.R.)	Europe, including the U.S.S.R.	Oceania.
1950	2,497	199	168	163	1,380	574	13
1975	3,828	303	240	303	2,210	751	21
2000	6,267	517	312	592	3,870	947	29

[These figures have been counted to the nearest million.]

Asia.—A glance shows that the populations of Asia (other than the Asiatic part of the U.S.S.R.) was a little over half the world population in 1950, but by the end of the century it may be more than three-fifths. During the same period while the proportion of population of some continents would have increased, that of Europe (and the U.S.S.R.) would have fallen dramatically. This is made clearer by the following table showing the percentage of estimated world population contained in each continent:—

Year.	World.	Africa.	North America.	Latin America.	Asia (excluding Asiatic part of the U.S.S.R.)	Europe (including the U.S.S.R.)	Oceania.
1950	100	8	6·7	6·5	55·2	23	0·5
1975	100	7·9	6·3	7·9	57·7	19·6	0·5
2000	100	8·2	5	9·4	61·8	15·1	0·5

Fertility and Mortality.—Why is this estimate made of such a relatively higher growth in Asia? Because it is believed that high fertility there will be maintained but mortality rates, which are now high, are declining. The opposite conditions obtain and are likely to continue to obtain in Europe and Japan, namely low fertility rates and low mortality rate. This is the probable picture as seen by the demographers (the specialists who study rates of births, deaths, diseases, etc.):—

High fertility	High mortality	Middle Africa
High fertility	High mortality but declining	North Africa South Africa Middle East Asia.
High fertility	Moderate mortality	North Latin America Central America.
Moderate fertility	Low mortality	North America South Latin America Oceania U.S.S.R.
Low fertility	Low mortality	Europe Japan.

We would therefore expect a rapid growth in North Latin America, Central America, the whole of Africa, the Middle East, and Asia; but less rapid growth in Europe, Russia, Japan, North America, South Latin America, and Oceania (Australia and New Zealand).

High-fertility Populations are, on the whole, those of the technically under-developed countries; and there is little evidence among populations of presently high fertility of those attitudes which, in Western countries and in Japan, seem to have been most closely associated with a deliberate control of the size of families.

Some Generalisations.—Some of the specialists on this subject agree on certain facts of major significance. Since the time of the Greeks and Romans, the wealthy classes have generally been characterised by a relatively low fertility. Fertility declined in the U.S.A. throughout most of the nineteenth century, and in the last quarter of that century fell in a number of western European countries. They make the broad generalisation that fertility varies inversely with income—that is to say, that as the income of groups rises the rate of fertility goes down. Broadly, also, fertility varies inversely with education and inversely, also, with the status of women. An exception to the latter generalisation is the U.S.A., where fertility is higher than in England, where women's status is not so high. Generally the wealthy or more industrialised countries have a lower fertility than poorer and less industrialised countries. However, a comparison of two industrialised countries with similar social and economic institutions (U.S.A. and England) shows that the wealthier country (U.S.A.) has a much higher birth-rate.

Marrying Younger in the U.S.A.—The rise in fertility in the U.S.A. referred to in the preceding

paragraph emphasises the need for caution in predictions of population changes. At the end of the nineteenth century an ageing—and eventually, a decreasing—population was forecast for America. But the returns of the Census Bureau for 1959 show that this position has changed. The average age for American women to marry is now just over 20 and for men just over 22. Whereas at one time the average family comprised not more than two children, now the ideal family contains three or four children. It seems as if a new element—of a rooted confidence—may come into effect in advanced industrial societies.

The Necessity for Increase of Food Production.—The world-wide increase of population could have occurred only by more food becoming available. New lands and new methods (for example, the use of chemical fertilisers) have led to higher yields. How will production be still further increased in the future? At present large tracts are only partly used for farming. In those tracts which are used fairly intensively the yield could be increased in many areas. With the advance of agronomy and other sciences lands which at present are used for farming only a little or not all will be brought into use. Chemical fertilisers will be used much more widely and also trace elements (that is small quantities of an element deficient in the soil, like copper or cobalt). New types of plant and new breeds of animals will be introduced. The elimination may be possible of many weeds and insect pests. Farm machinery, besides being more efficient, will release workers for other tasks. Irrigation will be extended; and distilled sea-water pumped to arid regions. So far, only small attempts have been made to breed and rear fish; and the seas of the world offer a vast potential source of food. At the first International Oceanographic Congress held in 1959 there was discussion of the whole new field of nutritional (and medical) research which is now developing in the study of the vitamins, antibiotics, hormones, and growth stimulants produced by living things in the sea.

Birth Control.—Besides raising production, another approach to a solution of the problem of overpopulation is to slow down the rate of increase. But there are difficulties in applying modern methods of birth control in the poorer countries with large rural populations. There may be government and religious objections; the problem of manufacturing and distributing contraceptives; the need to explain their correct use effectively; and the task will remain of persuading people, who have insufficient money for food or who do not receive wages at all, to buy or acquire contraceptives. These difficulties apply generally to three-quarters of the population of the world. Birth control has now become a question of world importance and discussion.

A GUIDE TO SOCIETIES.

On the following pages are the addresses of some of the societies working in the fields of social service, adult education, international affairs, and outdoor activities. The following addresses will be particularly useful for the lonely person who wants to find a congenial society, where, in company with like-minded people, some worth-while activity can be pursued. They are only a selection from all the societies working in these and allied spheres. See also list of societies, Q 10–12.

What the Societies Offer.—Many of the societies offer the facility of a unique specialised library, and most of them issue not only journals and magazines but pamphlets giving the latest authoritative views and discussions of contemporary problems. Besides these facilities the associations offer the individual the opportunity of hearing experts and of discussing the subject with others interested in the same subject. Many societies hold not only lectures but conferences, covering the week-end or several days, and some of them hold Summer Schools.

Social Service.

The National Council of Social Service (26 Bedford Square, London, W.C.1) is the main promotional and co-ordinating organisation of voluntary social work in Great Britain. It publishes *Handbooks on Voluntary and Public Social Services and Directory of Organisations.*

The Annual Charities Register and Digest is a famous reference book prepared by the Family Welfare Association (address below). It is a standard guide to every branch of charitable work, giving details of Adoption Societies, Almshouses, Homes for Incurables, Convalescent Homes of all kinds, and all Welfare Institutions.

Some useful addresses are:—

British Association of Residential Settlements,
Toynbee Hall, 28 Commercial St., E.1.
Central Council for Health Education,
Tavistock House, Tavistock Square, W.C.1.
Citizen's Advice Bureaux Service,
26 Bedford Square, W.C.1.
Family Planning Association,
64 Sloane St., S.W.1.
Family Welfare Association,
296 Vauxhall Bridge Rd., S.W.1.
Industrial Welfare Society,
48 Bryanston Square, W.1.
Institute for the Study and Treatment of Delinquency,
8 Bourdon St., Davies St., W.1.
National Association of Parish Councils,
26 Bedford Square, W.C.1.
National Association of Boys' Clubs,
17 Bedford Square, W.C.1.
Scottish Association of Boys' Clubs,
12 Alva St., Edinburgh, 2.
National Association of Girls' Clubs and Mixed Clubs,
30–2 Devonshire St., W.1.
Scottish Association of Girls' Clubs,
13 Eglington Crescent, Edinburgh, 12.
National Council of Women,
36 Lower Sloane St., S.W.1.
National Council of Y.M.C.A.'s,
112 Great Russell St., W.C.1.
10 Palmerston Place, Edinburgh, 12.
22 Howard St., Belfast.
National Federation of Community Associations,
26 Bedford Square, W.C.1.
National Federation of Women's Institutes,
39 Eccleston St., S.W.1.
National Union of Townswomen's Guilds,
2 Cromwell Place, S.W.7.
Federation of Women's Institutes of Northern Ireland,
28 Bedford St., Belfast.
National Federation of Young Farmers' Clubs,
55 Gower St., W.C.1.
National Marriage Guidance Council,
58 Queen Anne St., Grosvenor Square, W.1.
Save the Children Fund,
12 Upper Belgrave St., W.1.
Scottish Council of Social Service,
10 Alva St., Edinburgh, 2.
Northern Ireland Council of Social Service,
28 Bedford St., Belfast.
Tavistock Institute of Human Relations,
2 Beaumont St., W.1.
Young Women's Christian Association,
108 Baker St., W.1.
18 Atholl Crescent, Edinburgh, 3.
385 Malone Rd., Belfast.

Adult Education.

The National Institute of Adult Education (35 Queen Anne St., London, W.1) publishes a *Directory of Organisations* which describes all organisations which offer a direct educational service: and gives particulars of colleges offering educational courses. The National Institute also publishes a *Calendar of Residential Short Courses.*

Some useful addresses are:—

Workers' Education Association,
Temple House, 27 Portman Square, W.1.
177 Hill St., Glasgow, C.3.
56 Dublin Road, Belfast.
(For addresses of district secretaries see section "Family Affairs.")

Arts Council of Great Britain,
4 St. James's Square, S.W.1.
National Adult School Union,
35 Queen Anne St., W.1.
Association for Education in Citizenship,
3 Elm Mews, Bayswater, W.2.
British Drama League,
9 Fitzroy Square, W.1.
British Film Institute,
4 Great Russell St., W.C.1.
British Society for International Understanding,
36 Craven St., W.C.2.
English Folk Dance and Song Society,
Cecil Sharp House, 2 Regent's Park Rd., N.W.1.
National Book League,
7 Albemarle St., W.1.
Central Office of Information,
83 Baker St., W.1.
Hansard Society,
39 Millbank, S.W.1.
Council for Education in World Citizenship,
25 Charles St., W.1.
Council for Promotion of Field Studies,
Ravensmead, Keston, Kent.
Field Centres at—
Dale Fort, Haverfordwest, Pembs.
Flatford Mill, East Bergholt, near Colchester, Essex.
Juniper Hall, Mickleham, near Dorking, Surrey.
Malham Tarn, near Settle, Yorkshire.
Preston Montford, near Shrewsbury.
Slapton Ley, Slapton, Kingsbridge, Devon.
National Association of Women's Clubs,
26 Bedford Square, W.C.1.
National Central Library,
Malet Place, W.C.1.
National Council of Labour Colleges,
Tillicoultry, Scotland.
T.U.C. Education Dept.,
Transport House, Great Russell St., W.C.1.
Educational Centres Association,
Walthamstow Educational Settlement, Greenleaf Rd., E.17.
Educational Interchange Council,
43 Parliament St., S.W.1.
Institute of Sociology,
Le Play House, Ledbury, Herefordshire.
Rural Music Schools Association,
Little Benslow Hills, Hitchin, Herts.
Seafarers' Education Service and College of the Sea,
Mansbridge House, 207 Balham High Road, S.W.17.

International Co-operation.

The National Peace Council (29 Great James St., S.W.1), is a federation of national societies concerned in the promotion of peace. It publishes the *Peace Year Book*, which contains a directory of societies working for peace.

Useful addresses:—

United Nations Association,
25 Charles St., W.1.
Union of Democratic Control,
13 Prince of Wales Terrace, W.8.
Federal Union,
10 Wyndham Place, W.1.
Women's International League for Peace and Freedom,
29 Great James St., W.C.1.
International Voluntary Service,
72 Oakley Square, N.W.1.
British Society for International Understanding,
Benjamin Franklin House, 36 Craven St., W.C.2.
International Friendship League,
Peace Haven, Creswick Road, W.3.
Friends Peace Committee,
Friends House, Euston Road, N.W.1.
Africa Bureau, The,
65 Denison House, Vauxhall Bridge Rd. S.W.1.
United Europe Movement,
99 Park Lane, W.1.
Fabian International Bureau,
11 Dartmouth St., S.W.1.
English Speaking Union,
37 Charles St., W.1.
Council for Education in World Citizenship,
25 Charles St., W.1.
Royal Institute of International Affairs,
Chatham House, 10 St. James's Square, S.W.1.
Parliamentary Association for World Government,
21 Hampstead Lane, N.6.

The Citizen Outdoors.

Useful addresses are:—

The Ramblers Association,
48 Park Rd., N.W.1.
Scottish Ramblers Federation,
4 Kildonan Drive, Glasgow, W.1.
Youth Hostels Association,
England and Wales
National Office: Trevelyan House, St. Albans, Herts.
London Office: 22 Gordon Square, W.C.1.
Northern Ireland: 28 Bedford St., Belfast.
Scotland: 7 Bruntsfield Crescent, Edinburgh, 10
Eire: 39 Mountjoy Square, Dublin.
Co-op Holidays Association,
Birch Heys, Cromwell Range, Fallowfield, Manchester, 14.
Holiday Fellowship,
142 Great North Way, N.W.4.
Family Holidays Ltd.,
6 Dale St., Liverpool, 2.
National Parks Commission,
3 Chester Gate, N.W.1.
National Trust (for places of historic interest or natural beauty),
42 Queen Anne's Gate, S.W.1.
Council for Preservation of Rural England,
Council for Preservation of Rural Wales,
4 Hobart Place, S.W.1.
Commons, Open Spaces, and Footpaths Preservation Society,
11 King's Bench Walk, E.C.4.
Central Council for Physical Recreation,
6 Bedford Square, W.C.1.
Wales: 18 Windsor Place, Cardiff.
Northern Ireland: 45 Arthur St., Belfast.
Scottish Council: 4 Queensferry St., Edinburgh, 2.
Amateur Athletic Association,
54 Torrington Place, W.C.1.
Mountaineering Assn.,
102a Westbourne Grove, W.2.
British Mountaineering Council,
T. H. Sinclair, c/o Register of Restrictive Trading Agreements, Chancery House, Chancery Lane, W.C.2.
Scottish Mountaineering Club,
406 Sauchiehall Street, Glasgow, C.2.
Junior Mountaineering Club of Scotland (Glasgow Section),
28 Croftmont Avenue, Croftfoot, Glasgow, S.4.
Camping Club of Great Britain and Ireland,
35 Old Kent Road, S.E.1.
Youth Camping Association,
32 Summerlee Gardens, N.2.

Some Other Societies.

Political and Economic Planning,
16 Queen Anne's Gate, S.W.1.
Howard League for Penal Reform,
Parliament Mansions, Abbey Orchard St., S.W.1.
Progressive League,
20 Buckingham St., W.C.2.
Ethical Union,
13 Prince of Wales Terrace, W.8.
Proportional Representation Society,
82 Victoria St., S.W.1.

(*Note:* Unless otherwise stated the above addresses are in London, and this is further indicated by the postal number, *e.g.*, S.W.1. Correspondents writing from places other than London should include "London," as well as the postal number, in the address.)

THE MINISTRY

THE PRINCIPAL MINISTERS AS AT 1 MARCH 1960 IN THE CONSERVATIVE GOVERNMENT

THE CABINET (19)

Prime Minister, First Lord of the Treasury—Mr. Harold Macmillan.
Home Secretary—Mr. R. A. Butler.
Lord Chancellor.—Viscount Kilmuir.
Foreign Secretary.—Mr. Selwyn Lloyd.
Chancellor of the Exchequer—Mr. D. Heathcoat Amory.
Lord President of the Council, Secretary for Commonwealth Relations—The Earl of Home.
Secretary of State for Scotland—Mr. John Maclay.
Lord Privy Seal (and Minister for Science)—Viscount Hailsham.
Minister for Aviation—Mr. Duncan Sandys.
Colonial Secretary—Mr. Iain Macleod.
Minister of Defence.—Mr. Harold Watkinson.
Minister of Housing and Local Government (and Minister for Welsh Affairs)—Mr. Henry Brooke.
Minister of Education—Sir David Eccles.
Paymaster General—Lord Mills.
President of the Board of Trade—Mr. Reginald Maudling.
Minister of Agriculture, Fisheries and Food—Mr. John Hare.
Minister of Labour—Mr. Edward Heath.
Chancellor of the Duchy of Lancaster—Dr. Charles Hill.
Minister of Transport—Mr. Ernest Marples.

MINISTERS NOT IN THE CABINET.

First Lord of the Admiralty—Lord Carrington.
Secretary of State for War—Mr. Christopher Soames.
Secretary of State for Air—Mr. George Ward.
Minister of Pensions and National Insurance—Mr. John Boyd-Carpenter.
Minister of Health—Mr. Derek Walker-Smith.
Minister of Works—Lord John Hope.
Postmaster-General—Mr. J. B. Bevins.
Minister of Power—Mr. Richard Wood.
Minister without Portfolio—The Earl of Dundee.
Minister of State Scottish Office—Lord Craigton.
Minister of State for Foreign Affairs—Mr. D. Ormsby-Gore and Mr. John Profumo.
Minister of State for Colonial Affairs—The Earl of Perth.
Minister of State Commonwealth Relations—Mr. C. J. M. Alport.
Minister of State Board of Trade—Mr. F. J. Erroll.
Minister of State for Welsh Affairs—Lord Brecon.
Attorney General—Sir Reginald Manningham-Buller.
Lord Advocate—Mr. W. R. Milligan.
Solicitor General—Sir Jocelyn Simon.
Solicitor General for Scotland—Mr. William Grant.

SPEAKER OF THE HOUSE OF COMMONS—Sir Harry Hylton-Foster.
LEADER OF THE OPPOSITION—Mr. Hugh Gaitskell.

GENERAL ELECTION RESULTS

Party	1950 (*Electorate* 34,269,764)		1951 (*Electorate* 34,622,591)		1955 (*Electorate* 34,855,907)		1959 (*Electorate* 35,389,029)

The Law of England

A Concise Survey of the English Legal System, its history and development from early times, with further detail of some particular branches of the law which are of practical interest to the ordinary citizen.

TABLE OF CONTENTS

THE LAW OF ENGLAND

A.—*The Sources*

Comprising

COMMON LAW — CASE LAW — EQUITY * — STATUTE LAW

B.—*The Sub-divisions*

I. Constitutional Law.

Main Principles:

1. The Supremacy of Parliament.

2. The Rule of Law.

(a) *The Legislature:* The franchise, elections, Parliamentary procedure, relations between Lords and Commons, Bills and Acts.

(b) *The Executive:* The Crown, the Ministry, Government Departments and their powers.

(c) *The Judiciary:* The Courts and their functions, the Judges, means of controlling the Executive and inferior courts.

(d) *Local Government:* County, Borough, Urban and Rural District and Parish Councils and their powers.

(For further details, see C3–12.)

II. Criminal Law, dealing with the relations between the individual and the State.

A. Grave offences against—

1. *Public Order:* Treason, sedition, riot, blasphemy, obscenity, forgery, bigamy, perjury.

2. *Persons:* Homicide, assault, sexual offences.

3. *Property:* Larceny, burglary, housebreaking, false pretences, blackmail.

Subsidiary matters:

(a) Criminal responsibility.

(b) Unconsummated Crimes.

(c) Joint Crimes.

(d) Punishment and its purpose.

B. *Petty Offences, e.g.,* Road Traffic, Factories and Shops, Sale of Food, etc.

III. Status.

1. Nationality.

2. Domicil.

3. Marriage and Divorce.

4. Infancy.

5. Lunacy.

6. Bankruptcy.

7. Corporations.

IV. Law of Persons,* dealing with the relations between one individual citizen and another, established—

1. *By act of parties (Law of Contract):*

(1) Simple Contracts.

(2) Deeds:

(a) Capacity of parties.

(b) When writing necessary.

(c) Mistake.

(d) Misrepresentation.

(e) Duress and undue influence.

(f) Illegality.

(g) Breach.

2. *By Law (Law of Tort):* Civil Wrongs committed against—

(1) *The Person:* Trespass, assault, malicious prosecution, and false imprisonment.

(2) *Land:* Trespass, Nuisance.

(3) *Other Property:* Trespass, Conversion.

(4) *Persons towards whom there is a duty to take care:* Negligence.

(5) *Reputation:* Defamation (libel or slander).

(6) *Personal and Trade Relationships:* Seduction, enticement, trade molestation *and*—

(a) *Liability.*

(b) *Immunity.*

(c) *Effect of Death.*

(d) *Remedies.*

V. Law of Property.*

In General:

1. *Living Persons:*

(Effect of Status on Ownership).

2. *Deceased Persons:*

(Wills and Intestacies, Probate and Administration).

In Land (Immoveable Property):

1. Freeholds (Settlements).

2. Leaseholds.

3. Mortgages.

4. Title.

5. Joint Ownership.

In Other Property (Moveable Property):

1. Chattels.

2. Things in action.

* *Note:* Equity is applied only in matters of civil law relating to persons and property. It has no application to constitutional or criminal law.

The Law of England

THE Table set out on D3 shows in concise form—

A—the sources, and
B—the subdivisions

of the Law of England. The intention is to give a general picture of the whole system in tabular form, to explain briefly what the Table represents, and finally to deal, in slightly more detail, with a few selected subjects which may be of particular interest to the ordinary reader.

A word of warning is necessary. Learned text-books have been written on every one of the many subjects referred to in the Table, and the application of the law in any particular case is a matter for the professional expert. The following pages do not claim to do more than to make a brief survey of the whole field of English Law, for the general guidance and interest of the ordinary citizen.

A. THE SOURCES OF ENGLISH LAW

The citizen who desires to make some acquaintance with the English Legal System must begin by disabusing himself of several popular fallacies: for example, that it is a fixed and unalterable code, that it is strictly logical, that it is coldly impersonal and uninfluenced by human factors. The history and practice of the law display precisely the opposite characteristics.

1. COMMON LAW AND CASE LAW

The English Legal System is a *living organism*, not a dead, static code. The system as we know it began to develop in the thirteenth century, when Henry II extended the practice of sending the royal judges about the country "on circuit," to deal with crimes and disputes, and to adapt and give official authority to the best of the local customs, some of which had been in force since Anglo-Saxon days. The judges did this by *empirical methods*—that is, by practical, commonsense decisions on the actual cases brought before them, and by setting out their reasoning in detail. Simple records of the most important decisions were kept from the earliest times; as the centuries passed, the gradual elaboration of a system of *law-reporting* ensured that the *facts* of significant cases, the *reasoned judgments* delivered on those facts, and the *principles* those judgments enshrined, should be recorded and preserved; at the same time the doctrine of *precedent*—the rule that those principles, enunciated by a superior court, should be followed by all courts inferior to it—ensured consistency throughout the country. Thus there was gradually developed a body of principles—living, growing, and adaptable to new sets of facts as they arose; principles, moreover, which rose above local differences of custom and became *common* to the whole Realm. Hence the expression *common law*.

Case Law. The system we have described is by no means a thing of the past: it is still in force today. New circumstances are continually arising; cases come before the judges for decision, and it frequently happens that the principles laid down in the past do not apply precisely, in all respects, to the particular facts in point. When this occurs it is the judge's right and duty to *interpret and adapt the principle to the new facts* before him; his judgment is reported, and his reasoning made clear. The adapted principle of that judgment becomes part of the law of England; it must be followed by all inferior courts; and it will not be ignored or abandoned by courts of the same rank, or any superior court, without reasoned argument and careful consideration. Thus the practising lawyer can never sit back with the comfortable assurance that he has "completed" his studies; he must continually keep his knowledge up to date. The practice of law is not a science, based on rigid rules, but an art—the art of *applying the known principles to the facts of new cases* as they arise.

2. EQUITY

But the English genius for practical improvisation has never excluded spiritual and *ethical motives* of conduct. For hundreds of years the Church was a great power in the land, extending its influence far beyond the strictly ecclesiastical sphere. The great church-leaders of the past took an important part in the secular activities of government and administration; from an early date the King's Chancellor was an ecclesiastic. The Chancellor was not only the King's Secretary of State and Keeper of the royal seal; as royal chaplain he was "the Keeper of the King's conscience." It was to him, therefore, that the King turned for advice on matters of state where *ethical and moral considerations* were involved.

All human institutions are fallible, and the rough-and-ready methods of the early common law sometimes fell short of those ideals of abstract justice that inspire men's minds. Despite, or perhaps because of, its practical outlook, the common law tended to become circumscribed by its own precedents. As the machinery of justice became more elaborately organised, the idealistic doctrine—"Where there is a right there is a remedy"—was apt to degenerate, in practice, into the realistic but soulless form—"Where there is a legal remedy, there is a legal right." Too close an adherence to legal formalities led sometimes to a denial of justice. This was particularly so for the weak, who could not help themselves—feeble-minded persons, tricked or cajoled into "legally" signing away their property; infants unconscionably treated by guardians who, having got legal custody (under a will or otherwise) of the infants' inheritance, refused to honour their solemn trust; borrowers who, having delayed beyond the date fixed for the repayment of a loan, found themselves deprived, under the strict terms of the mortgage deed, of property many times more valuable which they had pledged only as security. For such cases as these the common-law courts

provided no remedy, since the victims had suffered *no actual illegality*. Petitions were therefore sent to the King, "the father of his people," begging him to right such wrongs; and the question of redress was delegated by the King to his Chancellor. The Chancellor had no power directly to revoke or interfere with the decisions of the royal judges by depriving the oppressive party of the property he had "legally" acquired, but he could, and did, insist that that party should not enjoy such acquisition, *unconscionably*, for his own sole advantage. The defaulting guardian, though he continued legally to hold the infants' property, was compelled to use it for the infants' benefit; the oppressive creditor, who had legally got possession of or sold the debtor's estate, was permitted to take out of the proceeds the amount of his loan, with reasonable interest and expenses, but must hand back the balance to the debtor. Thus the Chancellor administered a kind of *abstract justice*, based upon the promptings of conscience, and not on legalistic rules. He dealt with these cases in his own court—the Chancellery or *Chancery*—where the yardstick was *equity*—that which was right or fair. And over the centuries the principles on which the Court of Chancery acted became crystallised into a set of rules which followed their own precedents and made *conscientious conduct* their guiding star.

Naturally enough, the activities of the Court of Chancery were viewed with jealousy and misgiving by the royal judges of the Common Law Courts, and many were the clashes between the two. Equity, however, had come to stay, and the two systems were administered independently until as late as 1873. In that year Parliament passed the Supreme Court of Judicature Act, which (in effect) fused the two systems into one. By means of that and subsequent legislation there was constituted *one High Court of Justice*, of which the *Queen's Bench Division*, the *Chancery Division*, and the *Probate, Divorce* and *Admiralty Division* are component parts. The first-named is concerned primarily with common-law suits, the second with equitable matters; but both these Divisions must have regard to *both common law and equitable principles*. In case of a conflict of principles, those of equity are to prevail. The last-named Division (for historical reasons) deals with the diverse subjects of wills and intestacies, matrimonial suits, and disputes relating to ships at sea. Criminal cases fall within the jurisdiction of the Queen's Bench Division, but are dealt with in special courts. The criminal law (in strict fairness to accused persons) must be absolutely certain and clearly defined; it is administered on strict legalistic principles, from which the doctrines of equity are excluded. (For further details of the Courts and their functions, see C11.)

3. STATUTE LAW

While, as we have shown, the Courts have the function of *interpreting and adapting* the principles of law laid down in earlier times, they cannot legislate—*i.e., the Judge cannot make new laws*, or repeal or amend old laws, even when changes are rendered desirable by developing social conditions. The law-making body, or *Legislature*, is *Parliament*. A *Statute* or *Act of Parliament* is the joint act of the Queen, the House of Lords, and the House of Commons; while each of these three "Estates of the Realm" has its own functions, new law can be made, and old law repealed, only by these three Estates acting together, *i.e.*, by *Parliament*, or by some person or body of persons to whom Parliament has *delegated authority* to make *rules having the force of law*. Parliament is free of control by any written constitution or any person or body of persons whatsoever; an Act of Parliament must be enforced by all courts as the law of the land, unless and until it is repealed or amended by Parliament itself. Parliament is not bound by the Acts of a previous parliament, which it is free to repeal or amend as occasion may require. It is equally free to modify the rules of the common law and the rules of equity, however firmly entrenched; but those rules, unless and until modified by parliamentary legislation, continue to guide the Judges both in their interpretation and enforcement of *Statute Law*—*i.e.*, the body of Acts of Parliament still in force for the time being—and in their decisions on those common-law and equitable rules which the Statute Law has left untouched.

THE ENGLISH LEGAL SYSTEM

These three main streams—*common law* (and *case law*), *equity*, and *statute law*—have flowed throughout the centuries, sometimes independently and sometimes in conjunction, to feed the waters of that great river which is the *English Legal System*.

B. THE SUBDIVISIONS OF ENGLISH LAW

I. CONSTITUTIONAL LAW

This is that part of the English Legal System which relates to four main branches of national administration:—

(a) *The Legislature*—*i.e.*, the *law-making* body known as Parliament.

(b) *The Executive*—*i.e.*, the *Government* and the functions of its various components.

(c) *The Judiciary*—*i.e.*, the *Judges*, their *Courts* and powers.

(d) *Local Government*—*i.e.*, the *Local Authorities* and their powers.

The two main principles of the Constitution are:—

1. **The Supremacy of Parliament.**—*I.e.*, there is nothing that Parliament cannot lawfully do, and there is no person or body of persons above Parliament. Its Acts cannot be unconstitutional, since it can itself modify the Constitution at will. Its Acts for the time being in force are the law of the land, and nobody can question their validity.

2. **The Rule of Law.**—This means that no person or body of persons is above the law of the land, and that there is one system of law, and one system alone, for everybody. There is not in England, as there is in some other states, a special system of law and special courts for scrutinising the acts of ministers, civil servants, or other functionaries; such persons are bound by the same rules of conduct as other citizens. A complaint by a private citizen against a Secretary of State or a Commissioner of Police is investigated by the same courts, and under the same legal rules, as a complaint against another private citizen. Any apparent exception will be found to result from some special provision in an Act of Parliament itself. For example, the Army Act sets up a code of conduct for officers and soldiers, and does not apply to civilians; but that code is part of the Law of England because it is contained in an Act of Parliament—a code which (incidentally) remains valid only if it is confirmed by Parliament in every successive year. Again, the Emergency Powers (Defence) Act, 1939, conferred upon the Crown and its Ministers extensive powers, during the last War, to make Defence Regulations which should have the force of law; but the Act itself had to be passed by Parliament with the proper formalities. Such Regulations derive their legal and binding effect solely from the

powers delegated by Parliament; and the High Court of Justice is competent to scrutinise, and frequently does scrutinise, the wording of the Regulations and the manner in which those powers are exercised, and to satisfy itself that the Minister concerned is not attempting to exceed the authority which Parliament has vested in him—in other words, to protect the citizen against the *arbitrary abuse of lawful powers* and against their *unlawful enlargement*. *Delegated legislation* is always subject to such control; parliamentary legislation is not, since *nobody can question the validity of an Act of Parliament*. But the *interpretation* of any Act of Parliament—the ascertainment of its legal meaning and effect—is one of the proper functions of the Courts.

(A detailed explanation of the working of the four bodies above mentioned will be found in A CITIZEN'S GUIDE.)

II. CRIMINAL LAW

This is that part of the English Legal System which deals with the relations between the individual citizen and society as a whole. Thus, if A murders or robs B, the question of redress is not one merely for B or his family; the victim cannot, in a civilised community, be permitted "to take the law into his own hands," nor can it be left to him to decide what action should be taken against the offender—otherwise blood-feuds and public disorder would result. For that reason it has been the law for centuries past that, in the case of offences (1) against public order, (2) against the person and (3) against property, *the State (representing society as a whole) itself intervenes* and *prosecutes* the offender, for the purpose of upholding public order and vindicating the rule of law by inflicting *punishment* upon him—*not* for the purpose of *compensating* the injured party (which, as will be seen below, is the contrasting function of *Civil Law*).

The two main categories of Crime (as the Table shows) are:—

(a) *Grave (or Indictable) Offences*, which are dealt with at Assizes, the Central Criminal Court, and Quarter Sessions, and which carry severe penalties—death or lengthy sentences of imprisonment; and

(b) *Petty Offences*, which are dealt with in *Magistrates' Courts*, and are punishable by light sentences of imprisonment or by fines (with short sentences in the alternative). Examples of this latter class are (*e.g.*, under the Road Traffic Acts) driving without due care and attention, exceeding the speed-limit, causing an obstruction, etc.

Examples of (a) *Grave (or Indictable) Offences* are set out in the Table under the three main headings of:—

(1) *Offences against Public Order*;

(2) *Offences against the Person*; and

(3) *Offences against Property*.

In connection with all these categories of offences the *Criminal Law* is concerned with the following general considerations:—

(a) **Criminal Responsibility.**—*I.e.*, the primary principles that every person is presumed (until the contrary is proved) to be sane and "to intend the natural consequence of his acts," provided that those acts themselves are *voluntary* (*i.e.*, *intentional*) on his part. It would, for example, be absurd for a man, accused of wounding another person by shooting, to plead that he did not intend, when he discharged the firearm at the other person, to do him any bodily harm. On the other hand, it would be outrageous to convict and punish a child of four who, without understanding the wrongfulness of his behaviour, picked up and took away some attractive and valuable object from a shop-counter; a lunatic who killed somebody under an insane delusion that the victim was a wild beast; a boy (like Oliver Twist) who was compelled, by force or violent threats, to break into a house, or a man who took an overcoat from a public cloakroom, honestly but mistakenly believing it to be his own. In none of these last illustrations is the act a *voluntary* one in the sense that there was the *intention to do something wrong*. To the rule that an act is not a crime unless it is intentional in this sense there are a few rare exceptions—cases where an Act of Parliament has expressly and clearly made some form of *conduct punishable in itself*, whether it was intentional or not; for example, during the War, permitting a light to be visible in black-out hours was punishable, even if it was unintentional and involuntary on the part of the accused.

Intention must not be confused with *motive*. For example, in what has become known as "mercy-killing"—*i.e.*, taking the life of a person suffering from a painful and incurable disease—the killer is often actuated by a good *motive*—the desire to relieve hopeless suffering; but the *intention* is to kill, and the act is therefore a crime. (It is not necessary for the prosecution to prove any motive.)

The *burden of proof* in criminal cases is on the prosecution, *i.e.*, it is the duty of the prosecution to prove the accused guilty; not the duty of the accused to prove his innocence. The accused is presumed to be innocent unless and until his guilt is proved to the reasonable satisfaction of a jury. The jury are the sole judges of the true facts of the case, and their verdict must be unanimous.

(*b*) **Unconsummated Crimes.**—*I.e.*, *attempts* to commit crimes which are frustrated by some outside event or by some person's intervention. For obvious reasons the *attempt* to commit a grave crime is *itself an offence* for which the offender can be prosecuted and, if convicted of the attempt, punished by fine or imprisonment. *Incitement*, by one person, of another to commit a crime, and *conspiracy* between two or more persons to commit a crime, are usually offences in themselves, whether the incitement or the conspiracy proves successful or not.

(*c*) **Joint Crimes** are those in which two or more persons take part. Such participation may arise in different ways. A *principal in the first degree* is the man who commits the actual offence with *guilty intention* (see (*a*) above), or who induces its commission by some other person who himself does not understand what he is doing. A *principal in the second degree* is one who *aids and abets* the guilty perpetrator at the time when the crime is committed. An *accessory before the fact* is one who *instigates* or *helps to prepare* the commission of the crime by another person, though not himself present when that other person commits it. In most cases of *grave crime* all these *three classes of participants* in a crime are *equally guilty*, and liable to the same punishment, provided that all of them shared the same *common criminal purpose*. (Thus, if two armed burglars break into a house, with their weapons drawn, and one of them shoots and kills the householder, both will be guilty of murder; while the accomplice who helped to plan the burglary will be equally guilty if the plan included the carrying of loaded weapons.) An *accessory after the fact* is one who, knowing that a *felony* (generally speaking, a grave crime involving *violence*) has been committed, shelters or receives one of the participators to enable him to elude justice. This latter kind of accessory is liable to prosecution, but the penalty in his case is less severe than that imposed upon any of the other three classes.

(*d*) **Punishment and its Purpose.**—The purpose of punishment is fourfold:—

(i) *Retribution*—to demonstrate to the community in general that crime "does not

pay" and thus to uphold the rule of law and to prevent the deterioration of public morals;

(ii) *Prevention*—to restrain offenders, so far as possible, from repeating their crimes by keeping them in custody;

(iii) *Reformation*—to make them, so far as possible, better citizens by means of moral and ethical training—teaching them to "go straight"; and

(iv) *Deterrence*—to inspire among offenders and would-be offenders a fear of and a healthy respect for the law and the strength of society as a whole, which it protects.

There has been much controversy on the relative importance of these four functions of punishment. Until comparatively recent times *deterrence* was considered the primary function, and punishments were correspondingly severe and, by modern standards, savage. Experience has shown, however, that *crime is not effectively reduced* merely by *severity* of punishment, but rather by the *certainty or probability of detection* and conviction, and by the *elevation of living standards* and improvement in social conditions. And, particularly during the past half-century, *reformation* of the offender, whenever possible, has become a paramount aim, not only on grounds of humanity, but also for the purpose of reducing the wastage of human material which can frequently be salved from a life of crime if it is taken in hand, firmly but kindly, at an early stage. (See, for example, the sections headed *Juvenile Courts* and *Probation Officers* in A CITIZEN'S GUIDE, C11.)

III. STATUS

A person's *Status*—*i.e.*, his legal position in society—affects his legal rights and duties in most civil matters and, in some few cases, in criminal matters too (see under *Criminal Responsibility*, D6).

1. Nationality, in this connection, means British Nationality under the British Nationality Acts, the latest of which was passed in 1948. Under that Act the term "Commonwealth Citizen" was created which can be used as an alternative to British Subject A person may be a British subject by birth, by naturalisation, or by marriage, though under the Act of 1948 a woman who was not a British subject before marriage does not automatically acquire British nationality merely by reason of her marriage to a British subject. The law and the courts of this country can determine whether a person is a *British subject* or an *alien*; they cannot determine whether or not he is a citizen of some particular *foreign state*, since that is a matter for the law of the foreign state concerned. Generally speaking, in times of peace, an *alien* in this country has the same rights and duties as a British subject, except that an *alien* has *no right to vote* in parliamentary or municipal elections, and that some professions (*e.g.*, that of a solicitor) are closed to him.

2. Domicil means the country where a person has his *permanent home* without any present intention of changing it. His *domicil of origin* is that of his parents while he is under twenty-one; over that age he is free to acquire a new domicil by making his permanent home elsewhere. Domicil is of particular importance in matters of—

3. Marriage and Divorce.—English law generally regards as valid a *marriage ceremony* carried out in this country after the proper preliminaries and with the proper formalities, whatever the nationality or domicil of the parties. English law also accepts the validity of a *marriage ceremony* which has been carried out abroad according to the law of the country where it took place. But if one party or the other has an *English domicil*, the *status of the marriage as an institution* must depend on English law, whether the *ceremony* was in proper form or not. For example, a man who has his permanent home in England cannot evade the English rule against consanguinity by going through a *ceremony* of marriage, in Ruritania, with his mother's sister—even if such a marriage is lawful by Ruritanian law, and even if the ceremony has been carried out with the usual Ruritanian formalities, it is still *null and void* by the law of England. The English court will *not*, generally speaking, grant a *divorce* to a man who is *domiciled abroad*, since the law of the country which is his permanent home may not recognise this divorce, or perhaps any divorce, as valid; and it is improper that he should be regarded as a single man in England and a married man in his homeland. Similarly, English law *will* generally recognise the validity of a divorce granted by the proper court of his domicil (*i.e.*, of the state where he had his permanent home at the time) or of a divorce which the law of his domicil regards as valid, even if it was granted by a court elsewhere—and that whether he is a British subject or not. But a person, whatever his nationality, whose permanent home is in England will not be regarded here as validly divorced merely because he has spent a few weeks in Barataria, where divorce procedure is simple, and has been granted a decree there. His *status*—married or single—generally *depends on the law of his domicil*—*i.e.*, the law of the country which is his permanent home. (Further detail relating to the law of husband and wife will be found at the end of this section.)

4. Infancy is the status of a person under the age of twenty-one. An *infant cannot vote at elections*; he *cannot hold freehold or leasehold property*, and *he cannot be made bankrupt*. If he enters into certain kinds of *contracts* during his infancy he *can repudiate* them, if he so desires, up to a reasonable time after his twenty-first birthday. He *cannot make a valid will*, and his rights under another person's will or settlement cannot be compromised or altered without the leave of the High Court. An infant *cannot make a valid marriage without consent* of his parent or guardian, or of the appropriate court. His rights are at all times the special care of the Chancery Division of the High Court, which will protect those rights according to the Rules of Equity (see D5).

5. Lunacy, in the broad legal sense, is the status of a person who is "incapable, by reason of unsoundness of mind, of managing his affairs." "Lunacy" in this sense is not necessarily identical with any of the mental conditions to which such psychological terms as "insanity," "imbecility," "idiocy," and the like are applied; there need be no actual mental *disease*. When a person becomes incapable, for this reason, of managing his affairs, the law, in order to protect both him and society at large, *changes his status* by putting the custody of his person, or the control of his property, or both, into reliable hands. Such matters come under the supervision of the Chancery Division, since one of the functions of Equity (see above) is to protect those who cannot help themselves. Certification of "insanity" (in the psychological sense) is not necessary; but with the proper medical certificate and legal safeguards the *patient* (as he must be called) may be removed to a mental hospital. Some reliable person (usually a near relative) may be appointed, by an Order of the *Court of Protection* (a branch of the Chancery Division), as *Receiver* of his property. The Receiver's duties are to look after the property and income of the patient, pay his debts and defray the expenses of his maintenance and medical care, and generally to deal with the patient's property on the patient's behalf. Periodical accounts must be submitted to the Court, which will scrutinise them strictly and at once intervene if there appears to be any irregularity on the part of the Receiver. If there is no relative to take the responsibility, the *Official Solicitor* at the Royal Courts of Justice will be

appointed as Receiver, with the same duties and liabilities.

Apart from these matters of administration, a person of unsound mind is regarded as incapable of making a valid will, of entering into a legal agreement, or of dealing with his property. None of these transactions is valid unless the person concerned *understood the nature and effect* of what he was doing; and whether he did understand or not is a question of *evidence* in every individual case: medical and other witnesses must testify to his conduct and demeanour at the time when he entered into the transaction in question. If the Court comes to the conclusion that he was unable to understand the nature and effect of the transaction, the Court will *rescind—i.e.*, set aside or cancel—the transaction, even though it was in proper legal form.

If a person does an act which, if *voluntary or intentional*, would constitute a *crime* (see *Criminal Responsibility*, D6), and his legal advisers put forward a defence of insanity, the general rule is stricter: he can still be convicted unless he can prove, to the satisfaction of a jury, that he was "suffering from such a *defect of reason*, due to *disease of the mind*, as not to know the *nature and quality of the act* he was doing, or (if he *did* know this) not to know that what he was doing was *wrong*." Medical men, psychologists, and social reformers have long regarded this rule (which has been in force since 1843) as too severe. It is a rule applicable to *all crimes*; but the controversy has become associated in the public mind chiefly with *murder*. As a result of a long period of agitation and discussion the rule has been amended by section 2 of the Homicide Act, 1957; but *only in its application to murder cases*. It is now provided that "a person who kills (or is a party to the killing of) another shall *not* be convicted of *murder* if he was suffering from such *abnormality of mind* as substantially *impaired his mental responsibility* for his acts and omissions in doing, or being a party to, the killing." (It does not matter whether the "abnormality of mind" arises from "a condition of arrested or retarded development of mind," or from "any inherent causes," or is "induced by disease or injury.") The Act goes on to provide that a person who, under the old law, would have been convicted of murder shall instead be liable to be convicted of *manslaughter*.

6. Bankruptcy is the creation of Statute Law—there was no common law of bankruptcy. It is the status of a person (the "debtor") who is *insolvent—i.e.*, who is unable to pay his debts (exceeding £50) as they fall due. By the appropriate procedure the State takes the management of the debtor's property out of his hands and places it in the hands of the *Official Receiver*, whose duty it is to realise it and (subject to certain privileged claims) to distribute it *proportionately among his creditors*. The procedure is that one of the creditors files at the Bankruptcy Court a *bankruptcy petition*, on which the Court may make a *receiving order*, which has the effect of *transferring the legal management* of the debtor's property to the Official Receiver. That official investigates the debtor's finances and draws up an account, called a *statement of affairs*, showing the debtor's liabilities and assets. There is a *meeting of creditors* and a *public examination* of the debtor in Court, as a result of which the Court may either *discharge the receiving order* (on the debtor's showing that he can pay his debts, if he is given time, or persuade the general body of creditors to accept his proposals for a *composition* of so much in the £), or the Court may *adjudicate* the debtor a bankrupt. In the latter case it is open to the creditors either to leave the management of the debtor's property in the Official Receiver's hands or themselves to appoint a *trustee in bankruptcy* (usually an accountant) nominated by some or all of them, and that trustee takes over the management of the debtor's affairs. The debtor is bound, under penalty, to give *full information* about his affairs to the Official Receiver and the trustee in bankruptcy; he cannot, while he is a bankrupt, sit or vote in Parliament or act as a Justice of the Peace or in certain other offices. He will be committing an *offence* if he conceals any property or debt or falsifies his books of account, if he obtains property on credit or secures credit of £10 or more without disclosing his status, if he trades without such disclosure or fails to keep proper books of account, or if he leaves or attempts to leave the country, taking with him property, worth £20 or more, which ought to be divided among his creditors. It is also an offence for him to transfer property with intent to defraud any creditor, and any such transaction may be set aside by the Court.

7. A Corporation or Incorporated Body is an association of persons recognised by *Act of Parliament*, or by its *Charter*, as *one single legal entity*. It may be a *chartered* or a *statutory corporation* (*e.g.*, the British Broadcasting Corporation or the London Transport Executive), a *local authority* (*e.g.*, the London County Council or the Westminster City Council), or a *company* incorporated under the Companies Act, 1948, or one of the earlier Companies Acts. Generally speaking, a corporation of any kind has power only to do such things as it is given power to do by its Charter or by the Act of Parliament under which it was constituted; if it goes beyond that power it is behaving *ultra vires* —"beyond its powers"—and such acts on its part will be regarded by the Courts as null and void. The Court may also restrain the corporation by *injunction*—an Order forbidding it to act in such a manner.

Every corporation, being a single legal entity, is a legal *person* distinct from the individuals who are its members. Thus the *corporation itself* can take *proceedings*, or have proceedings brought against it, in the Civil Courts, and it may itself be *prosecuted* in the Criminal Courts, if it commits an offence, and be liable to a fine. No personal liability rests upon its individual members, directors, or officers unless they have personally done something unlawful or aided and abetted the corporation in its wrongdoing. The corporation itself can *enter into a legal agreement* with one or more of its members or a member of the public, and any person injured by its acts can enforce his legal rights against the property or assets of the corporation, which are distinct from the property or assets of the individuals who compose it.

A *company* is usually a commercial concern and generally takes advantage of the principle of *limited liability*, in which case the last word in its name must be the word "Limited." The principle is that, in the event of the company's becoming *insolvent*, none of its members can be compelled to contribute to its funds a larger sum than the sum which he agreed to pay for his *shares*, however large the indebtedness of the company itself. Every company must file at the Companies Registry a *Memorandum of Association*, setting out its *name*, the situation of its *registered office*, its *objects* (beyond which it has no power to act), its *capital*, and whether or not it is *limited*. It must also file its *Articles of Association*, setting out its *rules of management*, the method of issuing, allotting, and transferring its *shares*, the procedure for *meetings*, the powers and duties of its *directors* and other officers, and similar matters. If and when its objects have been *fully achieved*, or if it is desired to *discontinue its activities*, or if it becomes *insolvent*, it will be *wound up* and *dissolved*. The winding-up is undertaken by a *Liquidator* whose duties are similar to those of the trustee in bankruptcy (described above under *Bankruptcy*). The liquidator may be nominated by the members of the company or, in case of the company's insolvency, by some or all of the creditors, and the liquidator's appointment must be confirmed at a special meeting. If the winding-up of an insolvent company takes more than a year the liquidator must report annually to the *Board of Trade*, the Government Department which watches the interests of the persons concerned.

IV. The CIVIL LAW or LAW OF PERSONS

This deals with the relations between *one individual citizen and another*, and their mutual rights and duties. If A makes a business agreement with B, and breaks it, or if A walks without permission across B's field of new-mown hay, B will be able to secure *redress* against A by proceedings in a court of law. But in neither case is it necessary for the State to intervene, by way of prosecution, to punish A for what he has done, since no offence against society at large, and no violation of public order, or the rule of law, has arisen. The issue is one merely between A and B; B may choose to ignore the wrong done to him, or he may negotiate amicably with A for the payment of compensation or, if this fails, he may *as plaintiff sue A as defendant* in a *civil action* for *damages*. Unlike a criminal prosecution, undertaken by the State for the preservation of public order and vindication of the rule of law, with a view to punishing the offender, the *civil action* will be brought, if B so chooses, *by B himself* for the purpose of recovering *compensation* in money for the harm he has suffered and (in some cases) of obtaining an *injunction*—a Court Order prohibiting A from continuing his wrongful conduct. Again, a criminal prosecution will not be discontinued even at the request of the injured party, since the State itself is interested to see justice done; but a *civil action* can be *discontinued* by B at whatever stage he desires, with or without an agreement for the payment of *damages* in compensation.

These *relations between one individual and another*, interference with which may give rise to a *civil action for damages or injunction*, may arise in two alternative ways:—

(1) from the acts of the parties themselves, or

(2) from the operation of law.

1. Law of Contract

The relations between individuals which arise from the acts of the parties themselves are usually brought about by a *contract—i.e.*, by an agreement between them. A contract may be (a) *expressed in words*, as where A agrees to buy B's motor-car for £400, on certain stated conditions, or (b) *implied by conduct*, as where A calls a taxi and tells the driver to take him to a certain address. (*a*) In the former case, particularly if the contract is put into writing, the parties will normally have *expressed* all the necessary terms and conditions. (*b*) In the latter case it is *implied* by A's conduct, and understood by law and custom, that A will be expected to pay, at the end of the journey, the amount of the fare recorded by the taximeter; it is not necessary for the driver to stipulate those terms in advance. Everybody, several times in the course of each day, enters into an *implied contract* of this kind—when he steps on an omnibus to go to his work, when he orders a meal in a restaurant, when he tells the grocer to deliver goods to his house, and so on.

Simple Contracts and Deeds

(1) **A Simple Contract** is a contract *expressed in words* (whether in writing or not) without the formalities of a *deed* (see below), or a contract *implied by conduct*. There is no legal contract (*a*) unless there is *complete certainty* on the terms; (*b*) unless the basis of the agreement is lawful; and (*c*) unless both parties are *legally capable* of entering into it (see above, *Status*), and (*d*) in *complete agreement* on their intensions. And the agreement is not enforceable (*e*) unless there is some *consideration*, *i.e.*, some *quid pro quo*, expressed or implied, on either side. Thus (*a*) a promise by A that he will buy B's motor-car cannot be enforced by either side unless the price is mentioned, nor (*b*) if the car has been stolen by B, nor (*c*) if A is of unsound mind, nor (*d*) if B owns two cars, and A is thinking of the Ford, while B intends to sell the Austin. Again (*e*) a promise by C, during the course of the year's work, that he will give his employee, D, a Christmas box of £5 is not enforceable by D unless *he* has made a promise, or done something in return. If C tells D that he will give D the £5 at Christmas *on condition that* D puts in certain *extra time* over and above his normal working-hours, and D complies or promises to comply, that compliance, or promise of compliance, will be sufficient *consideration* to turn A's promise into an enforceable contract. There need be nothing at all in writing, except in a few cases laid down by law; in all other cases the only *value of a written agreement*, signed by both parties, is that it provides clear *evidence* of the terms that were agreed. A written contract requires a sixpenny revenue stamp if it is to be produced as evidence in a court of law.

(2) **A Deed** (broadly speaking) is a contract or other written document, *signed*, *sealed*, and *delivered* by the parties. The formalities of *affixing one's seal* to a legal document, and pronouncing the formula, "I deliver this as my act and deed," have emphasised the significance and solemnity of certain important transactions for many centuries past; and even persons who were unable to write their names were capable of carrying out the formalities of *sealing* and *delivery*. The legal requirement that deeds should also be *signed* was imposed only in 1925, by section 73 (1) of the Law of Property Act. The chief practical distinction between a simple contract and a deed is that a *deed requires no consideration* to make it enforceable. The special formalities which constitute the *execution* of a deed (*i.e.*, signing, sealing, and delivery) take the place of that moral obligation which (in a simple contract) the common law required to be satisfied by consideration on the part of the person to whom the promise was made. For this reason a *deed* is required in a case where A makes a promise to B which he desires to render enforceable without any corresponding promise by B to A, and also in a case where A desires to make to B a *gift of property* of such a nature that it cannot be physically handed over. This second case arises particularly where the subject of the gift is *land or buildings*; in fact, by a provision of the Law of Property Act, 1925, a *deed* is always necessary to *transfer the ownership* of any *freehold or leasehold* property, and also to grant a *tenancy* for a term of *more than three years*. The transfer of a *legal right* of some kind (*e.g.*, a share in a company or the claim to moneys under an insurance policy) is effected *by deed*.

In connection with the Law of Contract the following subsidiary matters must be considered:—

Subsidiary Matters

(a) **Capacity of Parties.**—The question whether a party to a contract is *legally capable* of entering into it. This question usually depends on that party's *status* (see above):—

(1) *Nationality.*—Nothing turns on this, except that *no commercial contract* can be made with an *alien enemy* in time of war.

(2) *Domicil.*—Where the two or more parties to a contract have their *permanent homes in different countries* it is a wise precaution for them to state, in the contract, under which country's law and by which country's courts, in case of a dispute, its terms are to be construed. If they omit to do so, and some dispute is brought before the English Court, it will endeavour to decide, by considering the wording of the contract, the language in which it is written, the domicil of the parties, and the general circumstances in which the contract was made, what legal system the parties intended to apply and by what court they intended it to be judged.

(3) *Marriage and Divorce.*—There is now no practical difference in contractual capacity between single persons, married persons, and divorcees.

(4) *Infancy.*—It is not (generally speaking) impossible for a person under twenty-one to enter into a valid contract, but he will be entitled to

repudiate it at any time up to his twenty-first birthday (or a reasonable period after that) *unless* the contract is (*a*) clearly for the *infant's benefit* on the whole (*e.g.*, professional articles or an agreement for apprenticeship), or (*b*) for the provision of *necessaries—i.e.*, food, drink, clothing, or services which are necessary to the infant in his particular station in life. (The origin of this latter rule is probably the practical consideration that, in earlier times, few people would have taken the risk of providing an infant, on credit, with the bare necessities of life if they had been precluded from suing him for reasonable payment.)

(5) *Lunacy.*—A party to a "contract" who knows that the other party is of unsound mind will not be permitted to hold the latter to his bargain.

(6) *Bankruptcy.*—A bankrupt cannot make a valid agreement to deal with his property in a manner which contravenes the law of Bankruptcy (see above, under *Status* D8).

(7) *Corporations.*—Whether a corporation is capable of entering into a particular contract depends upon the legal powers conferred by the Charter or Act of Parliament under which it was constituted, or (if a company) by its Memorandum of Association (see above, *Status* D8). If the matter to which the contract relates is of grave importance it will usually signify its adherence to the contract by *affixing its seal* with the formalities laid down by its Rules or Articles of Association. If it is an everyday or trivial matter the corporation will normally enter into a contract through some agent (*e.g.*, its Town Clerk, Director, or Secretary, as the case may be) who is empowered to sign or speak on its behalf (see *Agency*, D11).

(*b*) **When Writing is Necessary.**—There are certain exceptions, laid down by Act of Parliament, to the rule (see D9 (1) that a contract is enforceable even if made only by word of mouth or implied by conduct. The Statute of Frauds, 1677, provides that contracts of these exceptional kinds cannot be enforced by action in the Courts "unless the agreement upon which such action shall be brought, or some memorandum or note thereof, shall be in writing, and signed by the party to be charged therewith, or some other person thereunto by him lawfully authorised"—these last words mean an *agent* (see *Agency*, D11). It is *not necessary* that the *whole of the agreement* shall be formally set down in *writing*; but there must be a *written and signed record* of all the *essential terms*.

The most important of these exceptional cases are:—

(i) *A Guarantee.*—*I.e.*, a promise by A to B in the form—"Please lend money (or supply goods) to C, and if C does not pay you I will." A's promise by word of mouth cannot be enforced against him.

(ii) An *agreement* for the *sale or disposition of land* (*or buildings*) or of any interest in land (or buildings). We have already stated that the actual *transfer* of a *freehold or leasehold* interest must be effected by *deed* (see *Deeds*, D9). This is not the same as an *agreement to sell or dispose of* land or buildings; a *transfer* effects an *immediate change of ownership*, while an *agreement to sell* binds the party who signs it to make a transfer of ownership at some *future time*. Such an agreement need not be in the form of a deed, but its *essential terms* must be *in writing*.

(iii) An *agreement* which *cannot be carried out within one year* from the date when it was made, either because the actual carrying out of the transaction will take more than a year or because the agreement contemplates that more than a year is to elapse before the transaction is to be done. For example, A can make, by word of mouth, an agreement to employ B from month to month, or for not more than twelve months from the date of the agreement; but if he promises to employ B for three years, or for one year commencing in six months' time, B cannot enforce that promise unless the essential terms are in writing.

(iv) An *agreement in consideration of marriage.*—*e.g.*, a promise by A, to B, to give A's daughter, C, a certain dowry or income if B will marry her. (The words do *not* cover a *promise or agreement by B to marry C*; the breaking of the latter agreement —"breach of promise of marriage"—can give rise to an action for damages, by C against B, even if B has put nothing at all into writing.)

(*c*) **Mistake.**—Suppose that John Brown wants his portrait painted by a famous artist called William Brush, of whom he has heard but whom he has never met. He looks up "William Brush" in the directory and writes to him, at the address shown, offering him 100 guineas to paint the portrait. Suppose that particular "William Brush" is not the artist at all but a stockbroker of the same name. Even if that William Brush accepts Brown's offer, their apparent agreement will not constitute a valid contract, since Brown's *mistake* as to Brush's identity is so *fundamental* that it *destroys the very basis* of the agreement. Where there is a mistake of this kind, "going to the very root of the agreement," no valid contract has, in the eyes of the law, been made. In other special cases *equity* (see D4 (2)) may, on the ground of *conscience*, *relieve* one or both parties from liability under a concluded contract by *rectification* (*i.e.*, by correcting the terms they have inadvertently recorded) or by *rescission* (*i.e.*, by cancellation of the contract). It is not every mistake that will lead to these results; either the mistake must have been *fundamental* or the circumstances must have been such that it would be *unconscientious* for one party or the other to try and enforce his apparent rights.

(*d*) **Misrepresentation.**—Equity, on similar grounds, will often relieve a party from liability under a contract into which he has been induced to enter through a *representation* by the other party which is *substantially false—i.e.*, a statement which is misleading on some essential point. If it turns out that the *misrepresentation was deliberate*, the deceived party may in addition be entitled to claim *damages for fraud*. Whether the misrepresentation was *deliberate or innocent*, the deceived party will usually be able to have the contract *set aside—i.e.*, cancelled.

Suppose, for example, Jones wants to insure his life with the Markshire Insurance Company. Before issuing the policy, which is the contract between them, the Company will ask Jones—"Have you ever suffered from any serious illness?" Suppose Jones says "No," though he did in fact suffer from tuberculosis five years ago. Even if the policy contains a promise by the Company to pay Jones's widow £5000 upon Jones's death, the Company will be entitled to refuse to pay when that event happens; it has been induced to enter into the contract through Jones's misrepresentation.

(*e*) **Duress** means compulsion by *threats or force*. If a man has been compelled in this manner to put his name to a contract it is *voidable by him* at any time—*i.e.*, *he may repudiate* it on the ground of duress, and will be upheld by law in doing so. *Undue influence* means influence exercised by A upon B to such an extent that B could not have exercised any free and independent will in doing a particular act. Equity has always been jealous to protect certain classes of persons from this kind of influence; it goes so far as to *presume* that there has been undue influence where a guardian has got some benefit out of his ward, a parent from his child who is under (or only just over) twenty-one, a doctor from his patient, a solicitor from his client, or a priest from his parishioner. In most of such cases the onus is upon the person in the influential position, who has obtained the benefit, to prove that there was no undue influence; it is not for the other person to prove that his mind was wrongfully influenced by the former.

(*f*) **Illegality** of contract arises where the parties have agreed to do an act (i) forbidden by law or (ii) contrary to "public policy." (i) The former includes not only an agreement to commit a crime, but also an agreement to do an act which might be harmful to a third party and give him a right of action for breach of contract or tort. The courts will obviously not lend their assistance to a plaintiff who complains that the defendant has refused to honour his agreement to do something unlawful, whether (for example) the agreement was to burgle a house or merely to write a libellous article about another person. (ii) Even if the act agreed upon was not actually unlawful, the courts will refuse to enforce the agreement if it was to do something which is regarded as harmful to the community. It is not, for example, a crime for a man and a woman to live together without being married, nor is it even "unlawful" in the civil sense that such a way of life gives the one a right of action against the other; but no court would enforce an agreement by a woman to become a man's mistress, nor an agreement by the man to maintain her in return.

(*g*) **Breach of Contract** occurs when one of the parties breaks his promise and neglects or refuses to perform his duty under the contract. Breach by one party entitles the other party to sue for *damages*, the amount of which is usually assessed so as to compensate the latter for the *actual loss* he has suffered ("special damage"). In certain cases the court may award *general damages* in addition—*e.g.*, in an action for breach of promise of marriage the jilted woman may be awarded *general damages* for the distress she has suffered, her loss of reputation, etc., as well as *special damages* to cover the amount by which she is *out-of-pocket* by reason of giving up her employment, buying a trousseau, etc.

(1) *Damages* have always been the *common-law remedy* for breach of contract. In special cases, however, equity may grant two other remedies in addition to, or in substitution for, damages; but only where equity regards damages as an insufficient compensation. These additional remedies are:—

(2) *Specific Performance.—I.e.*, an order, to the party in breach, *actually to carry out* what he contracted to do. In practice this remedy is confined to: (i) contracts for the sale or letting of *land or buildings*, and (ii) contracts for the sale of some *article of a special nature* which cannot be replaced by spending money in the open market —for example, the sale of an original painting by Rembrandt. The remedy of *specific performance* is *never* granted to enforce a contract for *personal services*, since it would be impossible for the court to supervise the carrying out of such a contract.

(3) *Injunction.—I.e.*, an order by the court to the party in default *prohibiting him* from carrying out some positive act which would constitute a breach of contract. For example, where a singer has entered into a contract to work, for a certain period, only under the management of one particular impresario and no other, the court may order the singer not to offer or engage her services elsewhere during that period. Disobedience to an injunction constitutes *contempt of court*, and is punishable by fine or imprisonment.

Agency

(1) **The Status of an Agent.**—An *agent* is a person, who, being duly authorised, *acts on behalf of another person* who is called the *principal*. An agent is not the servant or employee of his principal. The principal tells his agent what transactions he wishes the agent to carry out, but does not exercise the control and supervision that a master exercises over his servant. Thus, for example, a solicitor is the *agent* of the client who has instructed him to attend to the purchase of a house; once instructions have been given it is left to the solicitor to carry out the work in his own way, as his skill and knowledge dictate. But the solicitor's clerk is the solicitor's *servant*; he is told what letters to write, what documents to prepare, what inquiries to make, and so forth. The two functions may sometimes appear to overlap; but the essence of agency is that there must be a *third party* with whom the principal is to be brought into relations; "the agent is the conduit-pipe connecting the principal and the third party." The agent is therefore debarred from acting for his *own benefit* without the principal's knowledge and consent.

Generally speaking, any person may do through an agent whatever he has power to do himself, except such transactions as depend upon some *personal qualification* peculiar to his own trade or profession. Thus, a man whose business is to sell or buy ordinary commercial articles can properly leave such business to an agent to perform; but an engineer, a lawyer, or a surgeon cannot entrust an agent with work that requires the exercise of *personal qualifications*, calling for special training and skill.

(2) **The Contract of Agency.**—Agency is brought about by *contract*—an agreement in writing, by word of mouth, or even one that may be implied from the conduct of the parties. No formal words are necessary: a request to an estate-agent to find a purchaser for your house will make him your agent for that purpose; if you ask a dealer to obtain for you a rare book or a Sheraton table, he is a purchasing agent on your behalf. The *terms* of the contract between the principal and the agent may be agreed upon in detail between them, or may depend upon the *usage* or general practice in the particular trade or profession. The parties are generally at liberty to agree upon whatever terms they please; in commercial agencies it is always desirable to set down in writing, for record purposes, the period for which the agency is to last, the area and scope of the agent's duties, his method of remuneration (usually by *commission*, at so much *per cent.* of the value of business he does), the prices at which he is empowered to sell or buy, and whether he is to be entitled to commission on sales to customers, or purchases from vendors, not introduced by him but carrying on business within his area.

In agencies of a special kind—where, for instance, a solicitor is instructed—his charges are regulated by a professional scale laid down by law; an estate-agent usually stipulates for payment of his commission on the recognised scale. Where no rate of remuneration has been agreed or implied, and after the work is done the parties cannot come to terms, the question must be decided by a court or arbitrator on the basis of *quantum meruit*—that is to say, an estimate of the *reasonable value* of his work.

(3) **Rights and Duties of Principal and Agent.**—These depend on the terms agreed between them; but if (as frequently happens) these terms are not on record, or are incomplete, certain legal principles apply. The first is that the relationship is one of *mutual trust*. The principal must do nothing to hinder the agent in earning his due; if he appoints a "sole agent," he must not entrust the transaction to other hands. If he does, he will have to pay the sole agent also. He must reimburse to the agent all expenses and losses properly incurred in doing what he was authorised to do. The agent must act honestly and loyally towards his principal; he must not make a secret commission or profit for himself, over and above what has been agreed; he must use proper skill and care, according to his qualifications, in his principal's business; he must keep proper accounts and pay over to his principal the money from time to time collected on the latter's behalf. If he has a *personal interest* in any transaction, he is bound to make *full disclosure*. The law will not tolerate any conduct which brings about a conflict between the agent's duty to his principal and his own *personal advantage*. The agent is therefore failing in his duty if, unknown to his principal, he buys the principal's property for himself, or sells his own property to the principal.

(4) The Principal and Third Parties.—So long as the agent has acted within the *scope* of his agency, the principal is bound by any authorised act done or agreement made between the agent and other parties. And even where the act was unauthorised, the principal is bound if he has, by words or conduct, led others to believe that the agent was authorised to do it. If the agent does something outside the scope of his agency—an act which no third party would reasonably expect the agent to have power to do—the principal is not legally bound towards the third party. These rules apply also to cases where the agent has received money or property from a third party on his principal's behalf, but fails to hand it over to him. The principal cannot claim payment over again from the third party unless the latter ought clearly to have known that the agent was not authorised to receive it. In other words, only contracts entered into and payments made by or to the agent in the *ordinary course of his business* are enforcable by and against the principal and third parties.

If the agent is also the *servant* of the principal, similar rules apply where the agent, in the ordinary course of his business, injures some third party by a wrongful act; the agent is liable in damages, and the principal also if the act (which turns out to be wrongful) was done within the *apparent scope* of the agency. So, if one of the agent's ordinary duties is to deliver goods on his principal's behalf by van, and while he is doing so he runs over a pedestrian through his own careless driving, the principal as well as the agent will be liable to pay damages for the injury.

But the principal cannot be *prosecuted and punished*, by fine or imprisonment, for an agent's *crime* unless the principal himself authorised or took part in it.

(5) The Agent and Third Parties.—If the agent makes a contract *without disclosing* that he is merely *acting as agent*, he is *personally* liable to the other party to the contract, even though he intended to act on his principal's behalf. If he discloses that he is acting merely as an agent, but does not disclose his *principal's name*, he (the agent) will not usually be personally liable. If the contract is in writing, he can safeguard himself by signing it "as agent," "on account of," "on behalf of," or "for" a named person.

If, on the other hand, the agent gives a third party to understand that he is acting for a certain principal but has *in fact* no authority to act for him, and if the principal later refuses to accept liability, the agent is liable to the third party for his false statement or pretence. This is known as *breach of warranty*—that is, he "warranted" or guaranteed that he had authority to bind his principal, but has broken his warranty; having thus left the third party without right of redress against the principal, the agent must bear the liability himself.

2. Law of Tort

This branch of the law deals with the relations, between one individual citizen and another, which arise from the operation of the law itself, without the necessity for the parties to do any act to put them into legal relations with one another. As was pointed out above (D9 (1)), if A and B are to be linked in a contractual relationship, each of them must take some step to bring that relationship about. No such step, however, is necessary in connection with the matters dealt with by the Law of Tort. Everybody has a right to expect that his person and his property shall be inviolable by other private citizens; he also has a right to expect others to refrain from attacks upon his character and his business reputation. These rights do not arise from any agreement or other act on his part, but from the general principles of the law.

A *tort* is the violation of such a right, which entitles the injured party to bring a *civil action* for damages to *compensate* for the injury he has suffered. The word *tort* (in French "wrong") is derived from the Latin *tortus* meaning "twisted" or "distorted."

It will be seen from the Table (D3) that some torts (*e.g.*, assault) may also be crimes—that is, they may entitle the injured party *either* to bring a *civil action* for *damages* or to *prosecute* the offending party and have him *punished* by a *criminal* court in cases where the offending party's action is liable to harm the community at large; a personal assault, for example, may lead in some circumstances to general disorder, and in that event it will become a matter for intervention by the State through the criminal courts. This section, however, deals only with the *civil remedies* which, as in breaches of contract, are primarily *damages* and sometimes *injunction* (see D11 (1).

The main headings under which torts may be committed are shown in the Table.

Trespass is a wrongful act committed by one citizen, against the will of another citizen, either against the latter's person or in disturbance of his possession of land or other property.

(1) Trespass against the Person may be by way of *assault, battery*, or *false imprisonment*. An *assault* is an attempt to do violence to the person of another; if the act is fully consummated it becomes a *battery*. Thus it is an *assault* for one man to shake his fist in the face of another, or to adopt a threatening attitude towards another, or deliberately to set his dog on another person. If the first person actually strikes the other person, or if the dog, encouraged by the first person, actually bites or harms the other person, that is a *battery*. In order to constitute an assault or battery, and to render the trespasser liable to an action for damages, his act must be *deliberate*. It is not assault and battery if A *accidentally* knocks against B in a crowd, with the result that B falls and is injured. The act by the trespasser must also be *against the will* of the person injured. Thus an operation performed by a surgeon, though it may seriously affect the body of the other person, is not an assault or battery if the other person has consented to the operation; but such an operation, performed without the other person's consent, may amount to an assault or battery.

Certain acts which would in the ordinary way constitute assault or battery are excusable; it is recognised, for example, by the common law, that a parent or a teacher has the right to inflict reasonable chastisement upon a child or pupil in his care, and provided that the chastisement is not excessive the child or pupil has no right of action. If, however, the chastisement results in serious injury or amounts to brutal violence, then the person inflicting it will be liable to an action for damages.

False imprisonment means the *unlawful restraint* of one person by another. It need not amount to actually locking up a person in a room; it is sufficient if his freedom of movement is *totally restrained* either by confinement or by the use of force or threat of force. It should be noted that the restraint must be unlawful; it is not, for example, unlawful for a police officer to arrest a person engaged in committing a crime, or a person whom the officer has reasonable grounds for suspecting of committing, or being about to commit, a violent crime. Even a private citizen may lawfully arrest a person who has actually committed a violent crime or whose behaviour has led to a breach of the peace.

The tort of *malicious prosecution* is committed by a person who makes a *criminal charge* against another person where the proceedings terminate in the acquittal of the latter, where the first person was actuated by spite or ill-will, where there was no reasonable or proper cause for the proceedings, and where the second person has suffered damage as a result. The essence of the tort is *malice* on the part of the person who

brought the criminal charge; it is not sufficient that he was honestly mistaken.

(2) **Trespass to Land** arises whenever one person *enters unlawfully* upon land or a building in the possession of another person. Two important points should be noted, as several popular fallacies exist about this tort. First, trespass to land is not in the ordinary case a crime, unless there is some Act of Parliament which makes the trespass a criminal offence (for example, under certain statutes it is a criminal offence for an unauthorised person to cross a railway-line or to enter a Government building from which considerations of security require unauthorised persons to be excluded). Secondly, it is not necessary, to constitute a trespass, that *actual damage* should be done to the land or building on which the trespasser has set foot. The essence of the tort is interference with the possession of the other party, and this may arise by merely walking across his field, or throwing refuse upon it, or placing or erecting anything on the land without the other party's consent; any act of *physical interference* suffices.

The *tort of nuisance* arises when an occupier of land or premises does something there which substantially interferes with the enjoyment by a neighbouring occupier of his land or premises. In *trespass* (see above) the interference must be *physical*; this is not so in cases of nuisance. For example, it is a nuisance if A allows his factory chimney to emit volumes of thick smoke which drifts continually into B's house or garden, or for A to carry on, in a building belonging to him, a trade or process which causes noxious smells or disturbing vibrations liable to interfere with B's enjoyment of his property. It is not, however, every such act that gives rise to an action for nuisance; there must be a certain amount of "give and take," particularly in urban areas, but people must not use their premises in an unreasonable or wilfully annoying manner. Thus it has been held that a teacher of music who had pupils singing in her house for several hours a day and on several days a week, which caused considerable disturbance to the person next door, was not committing a nuisance, since it was not unreasonable for her to use her house in this manner. On the other hand, when the person next door retaliated by clashing domestic implements and deliberately making as much noise as possible while the lessons were going on, he was held to have committed a nuisance because his conduct was unreasonable and wilfully annoying. But every case depends upon its own special facts. A building contractor who keeps a pneumatic drill going outside a private house, in connection with building operations, is not liable to an action for nuisance, provided that the use of the drill is necessary to the work, that it is confined to reasonable working hours and limited to a temporary period; but if the owner of a motor-cycle were to keep its engine running, merely to demonstrate its power, outside his own garage for several hours a day, and on several days a week, his neighbours could claim that that was (in law) a nuisance.

All the above examples may be classed as *private nuisances*, and they are torts but not crimes. There is, however, another class, known as *public nuisances*, which become criminal offences if they are liable to injure the public in general. Examples of these are leaving an unlighted obstruction on a public road, blocking a public footpath, or allowing a building to get into such a state of disrepair that it causes a danger to users of the public highway. In such cases the person causing the public nuisance may be prosecuted and punished and, moreover, any individual citizen injured by such conduct may have a right to bring a civil action for damages.

(3) **Trespass to Goods** is an unlawful disturbance by A of B's lawful possession of his goods. Such disturbance may arise by seizure or removal of the goods without the owner's consent or by conduct causing damage to the goods. It follows that every theft of goods is also a trespass; but for the preservation of public morality it is laid down that, if there is a criminal element in the conduct of the wrongdoer which makes his trespass theft, the injured party cannot bring a civil action for damages unless the thief has first been prosecuted in a criminal court.

The *tort of detinue* consists in the wrongful detention by one person of another's goods and his failure or refusal to deliver them up when demanded.

The *tort of conversion* or *trover* arises when A wrongfully appropriates the goods of B to his own use or to the use of another person, depriving the owner of them permanently or for a substantial time, or destroying them. These torts of *detinue* and *conversion* can be committed only against goods or articles of property; they cannot arise from interference with fixtures permanently attached to a building, growing crops or trees; but these torts may be committed if, after such things have been removed or cut down, the wrongdoer detains or converts them to his own use.

(4) **Negligence** in law has a very specialised meaning; it is not "neglect" or "carelessness" in the ordinary sense, but failure to take such care as the circumstances of the particular case demand. In the *tort of negligence* there are two essential elements—first, a *legal duty* to exercise proper care and, secondly, a *failure* to take such care. No action for negligence can be brought by A against B, even if B has been grossly careless, unless the relations between the parties were such that B was under that legal duty towards A. Moreover, the *degree of care* which A is entitled to expect from B will vary according to the nature of those relations.

One obvious example where the legal duty of care arises is among persons using the roads. All of us have the right to use the roads for the purpose of travelling, on foot or in some vehicle, and the manner in which each of us exercises that right will obviously affect the safety and comfort of other road-users. There is therefore a *legal duty of care* upon every road-user (under the common law, and quite apart from the provisions of Acts of Parliament relating to motor-cars) to exercise his right to walk or drive with due regard to the similar rights of other road-users. And, equally obviously, the *standard or degree of care* which it is reasonable to expect from the driver of a powerful car is higher than that which is expected from a pedestrian, since the amount of damage which will be caused by carelessness on the part of the driver is very much greater than that which the pedestrian is capable of inflicting.

We are *not* here referring to *offences* under the Road Traffic Acts, for which drivers or pedestrians may be *prosecuted and punished* under the *criminal law*. Careless or reckless driving or walking may be a criminal offence under those Acts, even if it has caused no injury to any person or property. In cases where such injury *has* been caused the *test* to be applied, in determining whether the injured person can *sue and recover damages* against the other party, is whether that other party has fallen short of the *standard of care* reasonably to be expected from him. It is true that disobedience to a provision of the Road Traffic Acts, or neglect of the Highway Code, may constitute *evidence* helping to prove that the latter party was lacking in the proper standard of care required of him; but there may be other circumstances which show that he was *negligent* in law, and liable to an action by the injured party for *damages*, even though he committed *no criminal offence*.

There are many other relationships where the *duty to take care* arises. One of these is the relation between *the occupier of premises* and persons *coming on to the premises*, whether they have a right to be there or not. Towards *trespassers* (see above) the duty of the occupier is merely a negative one—he must not "set a trap"—*i.e.*, he must not deliberately do anything calculated to cause injury, nor must he do any act which, if done carelessly, is reasonably likely to cause injury. If he knows a trespasser is on the

premises he must *warn* him before he *does any dangerous act*; the fact that the trespasser has no lawful right to be there does not entitle the occupier (for example) to weaken the supports of a bridge or set off an explosion without warning. If the occupier does so, he will be liable to be sued for damages, in an action for negligence, even by a trespasser who is injured as a result.

The law before 1958.

Towards a person who is *lawfully on the premises* the duty of the occupier varies according to whether that person is a *licensee* or an *invitee*. A *licensee* is one who has been licensed—*i.e.*, given permission, or who is permitted, to come on to the premises for his own benefit or convenience. A guest or visitor in a house, a person permitted to walk along a private road or in private grounds or to bathe in a private stretch of water is a licensee. Towards him the occupier has the same duty as towards a trespasser and, in addition, the duty of warning the licensee against any *concealed danger*, whether natural or not, which the occupier *knows to exist*. He is *not* expected to *guarantee* the *safety* of the premises nor to give *warning of obvious dangers*; but he will be liable to a licensee who is injured through dangers which are known to the occupier but concealed from the licensee. Thus the occupier of a building will be liable to a person visiting somebody living there if the visitor is injured by a broken stair on an unlighted staircase; similarly, the occupier of a farm will be liable to a person whom he permits to cross one of his fields if that person is attacked and injured, on his way, by a savage bull which the *occupier knew to be there* but the *licensee did not*.

An *invitee* is a person who goes to the premises on business which *concerns the occupier* and on the occupier's invitation, whether that invitation is actually expressed in words or merely implied. The best example of an invitee is a customer in a shop, or a traveller in a railway station, who is there not merely for his own benefit or convenience but also for that of the occupier. Towards an invitee the occupier's duty is the highest of all: he must take *reasonable care that the premises are safe* and *to prevent injury* to the invitee from *unusual dangers* which are *more or less hidden* and of the existence of which the occupier *is aware or ought to be aware*. If these duties are neglected, an invitee who is injured by such dangers can recover damages for his injuries.

The law after 1957.

The above rules, relating to the duty of care owed by an occupier to persons coming on to his premises, have been modified (as from January 1st, 1958) by the Occupiers' Liability Act, 1957.

The occupier's duty towards a *trespasser* remains *unchanged*. The Act, however, abolishes the distinction between an *invitee* and a *licensee* both of whom it describes by the new term, *visitor*. The principal rules are:—

1. The occupier owes the *same duty* (" the common duty of care ") *to all his visitors*, except in so far as he is free to, and does, extend, restrict, modify, or exclude his duty, to any visitor, by agreement or otherwise.

2. The " common duty of care " means a duty to take such care, as in all the circumstances is *reasonable*, to see that the visitor will be *reasonably safe* in using the premises for the purpose for which he is invited or permitted to be there.

There are *subsidiary rules*—*e.g.*, that an occupier must expect *children* to be *less careful than adults*, and that a person " in the exercise of his calling " (*e.g.*, a window-cleaner) can be expected to appreciate and guard against special risks incidental to that calling. And a *landlord* of premises, if he is under a *legal obligation towards his tenant* to keep the premises in repair, is to owe *to visitors the same duty* as if the landlord were the occupier, so far as concerns dangers arising from his default in carrying out that obligation.

Among the classes of persons upon whom the law imposes a *duty to take care* are those who practise a *profession or calling* which, from its nature, demands some special skill, ability, and experience. A man who is advised or treated by a physician, surgeon, or dentist, or who consults a lawyer or an architect, is entitled to expect him both to possess and to exercise a reasonable degree of such skill, ability, and experience. If the professional man falls short of the *proper standard* the patient or client may bring against him an action for damages on account of his negligence. But a mere error of judgment on a difficult point does not amount to negligence, provided that the professional man possesses the proper standard of knowledge and skill and has used them carefully and conscientiously to the best of his ability. And he is not liable, by virtue of his professional status, to an action of negligence for something he has done while acting otherwise than in his professional capacity—*e.g.*, a solicitor who is asked to express an opinion on the value of a house (which is no part of his professional duty).

(5) **Defamation.**—The tort of *defamation* is committed by a person who *attacks the reputation* of another by " publishing " a *false and defamatory* statement concerning him to a third party. If the defamatory statement is *in writing* or some other *permanent* form (*e.g.*, a picture, a film, or a gramophone record), then the action will be for *libel*. If the defamatory statement is in *spoken words* or some other *non-permanent* form (*e.g.*, by signs or gestures) it will be *slander*.

Another important distinction must be observed at the outset. In cases of *libel* the person whose reputation has been attacked may sue for damages *without proof of " special damage "*—*i.e.*, proof that he has *suffered actual harm* from the libellous statement; while in *slander no action* can normally be brought *unless special damage* can be proved. There are, however, five exceptional cases where such proof is unnecessary, *viz.*, in slanders:—

(*a*) *disparaging* a person in the way of his *business, profession*, or *office of profit* (*e.g.*, saying of a doctor that " he is ignorant of the first principles of medicine ");

(*b*) imputing *dishonesty* to a person holding an *office of honour* (*e.g.*, saying of a Councillor that " he gives contracts to his friends ");

(*c*) imputing that a person has committed a *crime punishable by imprisonment* (*e.g.*, saying of a man " he is no better than a thief ");

(*d*) imputing that a person is suffering from a *contagious disease* of a disgraceful kind (especially a venereal disease);

(*e*) imputing *unchastity* to a *woman or girl*.

In these five cases " publication " of the slander alone is sufficient to give rise to an action, without proof of special damage; for slanders of other kinds no action can be brought unless special damage can be proved.

Note also that no action can succeed, either in libel or slander, unless the statement complained of is (1) *false*, and (2) *defamatory* and unless (3) there has been *publication* to a *third party*. (1) The statement must be false "in substance and in fact"; if it is substantially true the person complaining has suffered no injury, recognised by law, to his right (see D12 (2)) to the inviolacy of his reputation. (2) The statement must be *defamatory*—*i.e.*, it must be one which " tends to lower him in the estimation of right-thinking members of the community," or which is " calculated to expose him to hatred, ridicule, or contempt." (3) *Publication*, in this context, means simply *making known* the defamatory statement to at least one *third party*. If the defamatory statement is conveyed *only to the person defamed*, and to no one else, there is no " publication," and the person defamed has *no civil remedy*.

In one exceptional case—where a defamatory statement, *in writing*, is likely to lead to a *breach of the peace*—the person making it may be *prosecuted* for the offence of *criminal libel*, for the purpose not of compensating the injured party, but of upholding law and order (see D6 (I)). In this exceptional case the *truth* of the statement (see above) is *no defence*, and *publication* to a third party is not necessary to secure a conviction. But there is no such offence as "criminal slander."

If a defamatory statement is made reflecting on a *class of persons* generally (*e.g.*, an attack on "Methodists" or "coloured people" or "money-lenders") that will not entitle a person who happens to belong to that class to bring an action unless he can show that *he personally* was aimed at and defamed. The family of a *deceased person* cannot bring an action for a libel or slander upon the reputation of the deceased.

If the person sued puts forward the defence that the words he used were "not published of and concerning" the person bringing the action, the question must be decided whether those to whom the statement was published could *reasonably understand* it to refer to him. If such understanding is reasonable, then it is no defence for the person who made the statement to show that he *did not in fact intend* to refer to the other person, or even that the latter's existence was unknown to him.

Some statements are defamatory in their *natural and primary sense* (*e.g.*, "John Brief is a thoroughly dishonest lawyer"); others may appear unexceptionable if looked at literally, but may have a defamatory meaning in a particular context, or in particular circumstances known to the persons to whom they are published (*e.g.*, "I hear Mrs. B has left her doctor a lot of money. A fine kind of doctor *he* is!"). In cases of the latter kind the person who claims that the published words are defamatory of him must plead an *innuendo*—*i.e.*, he must set out, in his statement of claim, the meaning in which he alleges the words complained of were used. It will be the duty of the judge to decide, as a matter of *law*, whether the words are *capable* of bearing that meaning; the jury will have to decide, as a question of *fact*, whether the words complained of did actually convey that meaning to those who heard or read them.

There are several recognised defences to an action of libel or slander:—

(1) *Justification.*—A plea that the words complained of were *substantially true*. Once the words have been shown to be defamatory, it is for the person who used them to prove their truth—not for the party injured to prove them false.

(2) *Absolute Privilege.*—By common law, or by Act of Parliament, defamatory words used on certain particular occasions, though published to third parties, cannot give rise to any right of action. The occasion is "absolutely privileged." No party to any *legal proceedings*, nor any witness, counsel, or member of the jury, nor of course the judge, can be called upon to answer for any words he has used *during the proceedings*, however spiteful, and however harmful they may have been to the reputation of any other person. The rule applies to *pleadings* (*i.e.*, allegations in writing, filed at the court) as well as to statements made in court by word of mouth.

Similar protection applies to words spoken *in Parliament* by a member of either House (though words spoken outside either House are not protected). And under the Parliamentary Papers Act, 1840, those who publish (in the ordinary sense of the word) the proceedings of either House, by its authority, are protected in the same way; so are official communications, on *affairs of State*, made by a minister to the Monarch, or by one officer of State to another in the course of his official duty. To all these *absolute privilege* applies.

(3) *Qualified Privilege.*—Apart from the cases just mentioned, there are other *occasions* which are *privileged*, not absolutely, but in a *qualified* sense. The *nature of the qualification* will be explained below; meanwhile it may be said that a *privileged occasion* of this latter kind arises whenever the person making a communication has an *interest*, or a legal, social, or moral *duty to make it*, and the person to whom it is made has a corresponding interest or duty to *receive it*. A common example is a reference given, about the character of a servant, by a former to a prospective employer; another is a report made, on the commercial credit of a trader, by one person who has dealt with him to another who intends to do so. Other occasions of *qualified privilege* are *reports* of *judicial proceedings*, of *public meetings*, and of the *proceedings* of municipal or other *public bodies*.

Such occasions are *privileged* to this extent and with this qualification—that there was no *malice* (*i.e.*, spite or other *improper motive*) in the mind of the person when he made the communication. If there was malice, then the fact that the occasion was one of qualified privilege will not protect him from an action for damages at the suit of the person defamed. In any such action it is the duty of the judge to decide, as a question of *law*, whether the occasion was one of qualified privilege; it is for the jury to decide, as a matter of *fact*, whether the defendant was malicious in what he wrote or spoke. (Contrast occasions of *absolute privilege*, where the presence or absence of *malice is immaterial*.)

(4) *Fair Comment* "on a matter of public interest."—This form of defence is most commonly employed by newspapermen, reviewers, and critics. If this defence is to succeed, the words to which it relates must be really *comment* (*i.e.*, expressions of opinion, not statements of fact): the comment must be concerned with *a matter of public interest* (*e.g.*, a book, a play, a musical performance, a political speech, or the public actions of men in the public eye—but not their private lives). Lastly, the comment must be *fair*—and it cannot be fair if it is actuated by *malice* in the mind of the commentator. If he has mingled with his comment some statement of *fact*, and that statement is inaccurate or misleading, that in itself will prevent the comment from being regarded as fair. The *onus is on the defendant* who is pleading fair comment to establish that what he is seeking to defend is really *comment*, that the matter on which he commented was one of *public interest* (not, for example, private scandal), and that the comment is *not based on any misstatement* of facts or *otherwise unfair*. Dishonest or insincere comment cannot be fair; but, on the other hand, an honest belief in the commentator's mind that his comment was fair is not enough for a successful defence. The comment must be fair *in fact*.

The usual *remedy* in actions of *libel* and *slander* is damages—a sum of money sufficient (in the jury's view) to compensate a man for the harm his reputation has suffered. In certain rare cases the Court may, in its discretion, grant an *injunction* ordering the defendant not to publish or not to repeat the publication of a libel.

The Defamation Act, 1952, reduces the risk of legal proceedings against anyone who *innocently* "published" a libel. The "publisher" may make an *offer of amends*, *i.e.*, an offer to "publish" a *correction and apology*, and to take practicable steps to *notify* those who have received copies of any defamatory document. (*a*) If the offer is *accepted* and the promise performed, the party defamed cannot bring, or continue, an action for libel or slander. (*b*) If the offer is *rejected*, then the "publisher," in any action taken against him, may plead, *in defence*, that the words were "published" innocently, and that the offer of amends was made as soon as practicable. *Innocent* publication means: (1) that the "publisher" did not intend the defamatory words to refer to the other party, and knew of no reason why they might be understood to refer to him; or (2) that the words were not in themselves defamatory, and that the "publisher" knew of no reason why they might be understood to defame the other party; also that, in either case, the "publisher" exercised all reasonable care in regard to the "publication."

V. THE LAW OF PROPERTY

I. In General

(1) **Living Persons.**—The special rights and disabilities which affect the ownership and disposal of property by certain classes of persons have been already dealt with under the heading of *Status* (D7–8). It is unnecessary to add anything here on the law of property *in general*, so far as living persons are concerned; but different rules are applicable (as will be seen below) to the ownership and disposal of *land and buildings* as compared with *property of other kinds*. The reason for this main distinction is that the former are, in their nature, *immoveable* and *cannot be physically transferred*, as can money and "chattels" (*i.e.*, animals and *tangible objects* which are capable of being owned). In addition, there is a third class—certain *intangible things* which can be owned and dealt with—for example, the right to be paid a debt, a share or stock in a company, an insurance policy, or a patent; these are known as *things in action*, and they can be transferred only in certain formal ways, which will be described below.

(2) **Deceased Persons.**—It is obvious that the law of any civilised community must make provision, not only for the *transfer by a living person of his property*, but also for the *transmission of that property (his "estate") upon his death.* English Law permits every person who is *not disqualified by infancy or lunacy* (see D7) to *give directions, during his lifetime, as to the disposal of his estate upon his death*; he can do this by means of a *will*. If he leaves *no valid will* he is said to die *intestate*, and in that event *the law itself* lays down how his estate is to be distributed. A concise survey of the law governing the estates of deceased persons is given below.

Wills and Intestacies.—The law of wills is highly technical; much trouble can be caused by a "home-made" will, and it is wise to seek a solicitor's advice. It is only possible here to outline the *formalities* necessary to make a valid will, and the *procedure* to be adopted after a death. The rules stated are those under English law—applicable to England and Wales, but not Scotland or Northern Ireland.

(1) **The Nature of a Will.**—The person making a will—the *testator*—sets down how he wishes his property to be disposed of after his death, and states the names of the persons (the *executors*) who are to attend to its disposal.

The executors may be, but need not be, some or all of the persons whom the testator desires to benefit under his will. One executor alone is sufficient in law; but if that one dies before he (or she) has completed his duties, delay and difficulty may arise. It is therefore better to appoint *at least two* executors; if one dies, the other has full powers to continue the work. If the testator's *estate* (that is, his property) is large, it may be best to appoint a bank as executor; all banks have trustee departments which are experienced in such matters. They have scales of charges for executorship work, which will be supplied on request. A personal executor is not permitted to charge for his work, unless the will authorises him to do so—a thoughtful provision for a complicated estate. Nor is the executor bound to accept the executorship when the death occurs.

A will "speaks from death"—that is, it has no legal effect until the testator dies; it can be *revoked* (that is, cancelled) in various ways, or alterations can be made by *codicil*, which is really a supplementary will. Further, the property to which it relates is that of the testator *at the date of his death*, which may be more or less than what he owns at the date when the will is made. The will can be revoked or varied as often as desired to suit changing circumstances; its provisions are not final until death.

Generally speaking, a testator may make whatever provisions, in regard to his or her property and the persons to be benefited, he or she thinks fit. He or she may even direct that his or her wife, husband, or children are to be deprived of all benefit from the estate; but, if he or she does so, it will be well to give the reasons, either in the will itself, or in a signed, witnessed, and dated document, which should be left with the will.

Under Acts of 1938 and 1952, a husband or wife, an unmarried daughter or son under twenty-one, or a son or daughter "under disability" (that is, one who for some reason is incapable of looking after himself or herself), who is not adequately provided for under the will, may apply to the Court for "reasonable provision for maintenance" out of the estate; the Court has power either to refuse the application or to grant the applicant whatever maintenance it thinks fit. In making its decision the Court will take note of the testator's reasons for his failure to provide for the applicant in question.

If a person dies without leaving a valid will, he is said to die *intestate*. In that case somebody (usually the husband or wife or next of kin) must apply to the Probate Registry (at Somerset House in London or in the nearest District Registry elsewhere) to be appointed *administrator*. An administrator has the same rights and duties as an executor. If there are children under twenty-one, and in certain other cases, there must be at least two administrators, and the procedure on death is more involved and troublesome than where executors have been appointed by will. Further, as the testator has not directed what is to happen to his property, the law has laid down an *order of succession*, which the administrators must observe. The intestate's husband or wife is then entitled first to the *personal effects* (furniture, household goods, motor-cars, books, etc.); next, to the whole of the estate, if there are no children or near relatives, or £5,000 if there are, and, after that, the husband or wife and children have certain rights in the remainder of the estate, if any, details of which can be found in the Intestates' Estates Act, 1952. If there is no husband or wife, or no children, or neither, the next of kin of the intestate will benefit in order of nearness of their relationship to the deceased.

It is always prudent to make a will, however simple, since by doing so, the testator exercises control over the disposal of his property and saves considerable trouble for his family.

(2) **The Execution of a Will.**—The formalities must be strictly observed, except in the case of soldiers, sailors, and airmen on active service (including members of the Women's Services and nurses), for whom informal directions, even in a letter or by word of mouth, are sufficient. For all other testators, inattention to the formalities may render the will invalid, and will in any case cause considerable trouble and expense.

The will must be *in writing—i.e.*, not by word of mouth—handwritten, typewritten, or printed, but the wording need not be in legal or formal language, so long as it clearly identifies the testator, the executors, the various kinds of property dealt with, and the persons to be benefited. It should also state that the following formalities have been carried out when it was executed—that is, signed by the testator and *attested—i.e.*, witnessed by two competent persons:

(a) *The will must be signed* by the testator, or by some other person in his presence and by his direction. If the testator can write, his *usual* signature will suffice; if he is illiterate or too unwell to sign in full, he may make his "mark" or his initials alone. If he is incapable of holding a pen, someone else may sign for the testator, provided he is present at the time and authorises the signature. If the testator is blind or otherwise incapable of reading the will, it should be read over to him before his signature or mark is placed on it.

(b) *The signature or mark must be at the foot or end* of the will. This means (i) nothing added

below the testator's signature, and (ii) nothing written anywhere on the document *after the testator himself has finished signing*, will be valid, except the signatures, addresses, and descriptions of the witnesses. If, therefore, at the last minute the testator desires some addition, alteration, or deletion to be made, he and the same witnesses must sign or put their initials against the addition, alteration, or deletion, which otherwise will be ignored.

(c) *The testator's signature* must be made or (if he cannot sign) acknowledged *in the presence of two witnesses*, who must both be *present at the same time*. Any persons may be witnesses, so long as they are capable of understanding what is going on. They need not read the will or know its contents; but if either of them is a *person who is to take a benefit* under the will, he or she will *lose that benefit*. It is therefore safest to call in witnesses who are strangers to the testator. Both witnesses must be *present together* when the testator signs (or acknowledges) his signature; it will not be a valid attestation if first one witness, and then the other, is called into the room.

(d) *The witnesses must sign* the will *in the presence of the testator*. Either witness may, if necessary, sign by mark or initial, but no other person may sign on his behalf. For identification purposes it is usual and desirable for the witnesses to add their addresses and occupations, in case of a subsequent dispute which may necessitate their being found to give evidence.

If the will consists of several pages, they should be fastened together before execution and the signatures of the testator and witnesses should appear at the end of every page, not to satisfy the rules set out above, but as evidence that every page formed part of the will when it was executed.

It is desirable (though not legally essential) that the will should bear, just above the signatures of the witnesses, an *attestation clause*—that is, a formal statement that these formalities have been carried out. The usual wording of this clause will be found in the example shown below.

All these rules apply in exactly the same way to a *codicil*.

(3) **The Contents of a Will.**—The opening words should clearly identify the testator by his full names, occupation or description, present address and (if possible) other recent addresses, and declare that this is his *Last Will*. It is sometimes found at death that a testator has a banking account or stocks and shares registered in his name at some past address, and in such cases the bank or company concerned, wishing to be sure that his identity is clear, may insist upon a sworn statement to the effect that he is the same person as the person they knew as customer or shareholder. (See the example below.)

Next follows the *revocation clause*—a declaration that the will now being made *revokes* (that is, cancels) all previous wills and codicils. If this is not inserted, doubts may arise after death as to whether the new provisions are intended to be substituted for, or merely to supplement, provisions in an older will. If it is intended that the older will is to remain valid in part, that should be clearly stated. If the document now being executed is a *codicil*, it should be described as such, and the date of the original will to which it is a codicil should be mentioned, and also which parts of the original will are being *confirmed*, to stand good, and which *revoked*.

The next clause should appoint the executors, who must be identified by their full names and descriptions or addresses. "My brother John," "my son Charles," or "my mother" will suffice, since only one person could possibly answer to any of these descriptions; but "my wife" is not enough without giving her names in full, since it does not follow that the person who is the testator's wife at the time of his death was necessarily his wife when the will was made.

Next follow the directions for disposal of the testator's property. *Bequests or legacies* of particular articles ("my pearl necklace," "my oak bedroom suite") or of particular investments ("my 3% War Stock")—these are *specific legacies*—must clearly identify exactly what is being bequeathed. In the case of land or a house, the full description should be given—"my leasehold house and grounds at 31, Acacia Road, Redhill in the County of Surrey," or "my freehold farm known as 'Newlands' at Northgate in the County of Derby." The words "I devise" are the technical words appropriate to freeholds: "I bequeath" to all other kinds of property: the effect is the same. (Bequests or legacies of *sums of money*—*pecuniary legacies*—should preferably be stated in words rather than figures; if figures are used the accidental omission of a nought may be disastrous.)

Finally, there is the clause that deals with the *residue* of the Estate—that is to say, whatever will remain after the executors have paid the funeral expenses, death duties (if any), legal and other fees, the testator's debts, and the pecuniary legacies he has bequeathed, and after the specific bequests have been handed over to those entitled. Such a clause is necessary because no testator can be sure, when he makes his will, that he has disposed exactly of everything of which he may die possessed, or that all the persons to whom he has made bequests will necessarily be alive when he dies. In general, the death of such a person—a *legatee*—before the testator causes that person's legacy to *lapse*; but if there is a bequest of the *residue* to one person, or for division among a number of persons, no harm is done: the *lapsed legacy*, being left over and undisposed of, becomes *part of the residue* and passes under the final clause.

(4) **Revocation and Revival.**—A will or codicil may be *revoked*—cancelled—by "burning, tearing, or otherwise destroying" it with the intention of revoking. Destruction by accident, or without the testator's desire to revoke it, is ineffective, and if a copy exists, its provisions may be put forward as still valid. The revocation clause in a later will (see above) will be equally effective to revoke an earlier will; or some part of the earlier will may be revoked by a later codicil clearly referring to that part.

A will is also *revoked*—generally speaking—by *subsequent marriage*, since the law assumes that, if the testator who is newly married had had time for or given thought to the matter, he would have altered his will. If he did not do so after marriage, he will die intestate.

If a testator makes *Will A*, and later on *Will B* containing a revocation clause, Will A is revoked—*i.e.*, cancelled. But if *Will B* is in turn revoked by *Will C*, that does *not revive*—*i.e.*, revalidate—*Will A*, unless *Will C* says, in so many words, that "*Will A* is hereby revived."

SPECIMEN WILL

I JOHN SMITH of 31 Acacia Road Redhill in the County of Surrey Company Director [1] HEREBY REVOKE [2] all wills and testamentary documents [3] heretofore made by me AND DECLARE this to be my LAST WILL.

1. I APPOINT my wife JANE SMITH [4] and my Solicitor EDWARD JONES to be jointly the Executors of this my Will.

2. I DEVISE my freehold farm known as "Newlands" situate at Northgate in the County of Derby unto my son JAMES SMITH in fee simple.[5]

3. I BEQUEATH the following specific legacies: [6]

(1) To my son THOMAS SMITH any motor-car of which I may be the owner [7] at the date of my death.

(2) To my said son JAMES SMITH all my shares in the Company known as John Smith & Sons Limited.

(3) To my said wife all my personal chattels [8] not hereby or by any codicil hereto otherwise bequeathed [9] for her own absolute use and benefit.[10]

4. I BEQUEATH the following pecuniary[11] legacies:

(1) To my daughter JULIA SMITH the sum of TWO THOUSAND POUNDS.

(2) To my secretary EVELYN ROBINSON the sum of ONE HUNDRED POUNDS.

5. I DEVISE AND BEQUEATH all the residue [12] of my real and personal estate whatsoever and wheresoever not hereby or by any codicil hereto otherwise expressly disposed of as to my freeholds in fee simple [5] and as to my personal estate absolutely unto my said wife JANE SMITH for her own absolute use and benefit.[10]

6. I DIRECT that any executor of this my Will being a Solicitor or a person engaged in any profession or business may be so employed and act and shall be entitled to make all proper professional charges [13] for any work done by him or his firm in connection with my Estate including work which an executor not being a Solicitor or a person engaged as aforesaid could have done personally.

IN WITNESS whereof I the said JOHN SMITH the Testator have to this my LAST WILL set my hand this twelfth day of April One Thousand Nine Hundred and Fifty-Five.

[14] SIGNED AND ACKNOWLEDGED by the above-named JOHN SMITH the Testator as and for his LAST WILL in the presence of us both present at the same time who at his request in his presence and in the presence of each other have hereunto subscribed our names as witnesses: } John Smith

George Matthews,
6, Elm Road,
Redhill, Surrey.
Chauffeur.

Ida Gray,
10, Oaktree Road,
Redhill, Surrey.
Children's Nurse.

Notes

[1] Profession is usually inserted for identification purposes.

[2] Revocation Clause—cancels all *previous* wills and codicils.

[3] "Testamentary documents"—includes both wills and codicils.

[4] Wife's *name* should be mentioned—he may have a different wife by the time he dies.

[5] "In fee simple"—technical words showing that the entire freehold interest is disposed of.

[6] "Specific legacies"—*i.e.*, legacies of actually specified things.

[7] Not "my motor-car"; he may sell his present car before he dies and perhaps buy a new one, in which case there might be a dispute as to whether he meant only the car he owned at the date of his will.

[8] This expression is defined in the Administration of Estates Act, 1925. It includes furniture, plate, china, wines, cigars, books, and other *personal effects*. It is better to use a word clearly *defined* by Act of Parliament than a vague word like "possessions."

[9] *i.e.*, all personal effects which the Testator has not left or will not leave to anybody else.

[10] These words show clearly that, although the wife is one of the Executors, with the duty of clearing up the estate for the benefit of *all* the persons to be benefited, these particular bequests are for *her own personal benefit*.

[11] "Pecuniary"—*i.e.*, money.

[12] "Residue"—everything left after all the other gifts have been disposed of.

[13] Charging Clause, without which the Executor who is a Solicitor would not be able to charge for his work on the Estate.

[14] This is the proper form of *attestation clause*—*i.e.*, the clause showing that the proper formalities for signing and witnessing were observed.

Probate and Letters of Administration.—It is a peculiarity of the English system that a deceased person's estate, upon his death, does not "vest in" (*i.e.*, fall into the possession of) the persons to whom he has left it by will, or among whom it has by law to be distributed (the "beneficiaries"); the estate vests, in the first instance, in his executor or executors, if he has appointed any such. (If he has made no such appointment, then, pending the appointment of administrator or administrators (see above), the estate vests (for the time being) in the Presiding Judge of the Probate Division of the High Court of Justice; that Judge has no duties in relation to the estate, but any notices that would, if there were executors, have to be served upon them, must be served for the time being upon him.) The generic name that applies both to executors and administrators, when their title has been lawfully recognised, is *legal personal representatives*; that is to say, they are *recognised by law as representing the deceased person*, for all purposes under the law of property, and for most purposes under the law of contract and the law of tort. Generally speaking, the deceased person's rights and liabilities are transmitted to his legal personal representatives, and can be enforced by or against them as soon as they have taken out a *grant of probate* or of *letters of administration*.

This "grant," in either case, is a document issued by one of the Registries and bearing the seal of the Probate Division of the High Court and the signature of one of its Registrars. It states the deceased's name and address, the date and place of his death, and *either* (1) that his *last will* has been *proved and registered* in the Registry concerned, or (2) that he died *intestate* (as the case may be); that (in the former case) the *executors*, or (in the latter case) the *administrators*, whose names addresses, and descriptions are given, are *entitled to administer* (*i.e.*, to deal with) all the estate which "vests in" them by law; and the document concludes by certifying that an *Inland Revenue Affidavit* has been delivered, showing the *gross and net values* of the estate and the amount of *estate duty and interest* (if any) paid. Where a will has been "proved," a photostat copy of the will is bound up inside the "grant"; if no will has been "proved" the "grant" consists of a single sheet bearing the above-mentioned particulars. It is important to note that, in either

case, the *title* of the *legal personal representatives* (*i.e.*, their legal right to deal with the estate) is evidenced by the "grant"—*i.e.*, the document by which the Court's authority is conferred upon them—and not directly by the terms of the will or by their relationship (if any) to the deceased. Anybody, for example, who is *purchasing property of the deceased* from the legal personal representatives is required only to *satisfy himself that probate or letters of administration have been granted to them*; such a purchaser is not in the least concerned with the terms of the will.

Whenever any *formal transaction* has to be carried out in connection with the deceased person's estate the "grant" must be produced; this applies in particular to dealings with land or buildings, "things in action" (see D 23 (2)), the initiation, defence, or continuation of legal proceedings for the benefit of the estate, and the transfer of the deceased's contractual rights. There are, however, a number of *informal acts* which the persons (if any) appointed by the will to be executors, or the nearest relatives who intend to apply for letters of administration, may properly do before the issue of the "grant"; these include such common-sense matters as arranging the funeral, safeguarding and insuring documents and valuables, feeding livestock, locking up premises, and preserving property which would deteriorate if neglected. All persons should, however, take care *not to sell or dispose of any part of the estate before the "grant"* is issued; a person who, without lawful authority, meddles with the estate may find himself regarded as *executor de son tort*—*i.e.*, placed in the position of an executor by his own wrongdoing—and thereby bound to meet the liabilities of the deceased person, and pay the death duties (if any), for which he ought to have provided. Even a person named in the will as executor takes a risk if he does more than the most urgently necessary acts before probate, since it may turn out that that will is, for some technical reason, invalid, or some later will may come to light in which he is not named.

Not more than four persons can apply for a grant of probate or letters of administration. If therefore the will names more than four executors, the persons named will have to decide among themselves which of them are to apply. Even if there are no more than four, *none of them is compelled* to apply, unless he has already meddled with the estate; he can renounce his right by signing a form of renunciation. If the deceased has appointed no executor by will, one or more (not exceeding four) of the next-of-kin can apply for letters of administration. Apart from the special cases (see above) in which there must be at least two administrators, no grant will be made to any more distant relative of the deceased unless and until all nearer relatives have renounced their rights or been "cleared off"; this last expression means that it must be clearly shown that they are dead or for some other reason are incapable of acting as administrators. (The order of priority among the relatives entitled to take out a grant is: (1) husband or wife; (2) children and their "remoter issue" (*i.e.*, grandchildren, great-grandchildren, etc.); (3) parents; (4) brothers and sisters and issue of deceased brothers and sisters; (5) half-brothers and half-sisters and issue of deceased half-brothers and sisters; (6) grandparents, and so forth.)

It has been said above that the property of a deceased person "vests" on his death in his executor or executors, if any; if there are no executors it "vests" in his administrators as soon as they have been duly constituted as such by the "grant." *In law* these *legal personal representatives* (executors or administrators) have the same *powers* of disposing of the deceased's property as if they were the owners of that property in the fullest sense; but in accordance with the rules of *equity* (see D4) they must exercise their powers of disposal strictly in accordance with what is *just and conscionable*—*i.e.*, they must distribute the property itself, or sell it and distribute the net proceeds, as laid down by the terms of the *will* (if any); in case of an intestacy, as laid down by the *law of succession*, as set out in the Intestates' Estates Act, 1952. That strict exercise of their powers which conscience demands will be enforced, in case of need, by the Chancery Division of the High Court of Justice (see D5), *at the suit of any beneficiary* under the will or intestacy. But *purchasers* and persons other than the beneficiaries can safely deal with the legal personal representatives as though they were legal owners of the deceased's property, provided the "grant" is produced as evidence of their powers.

The *procedure* in applying for a *grant of probate* or *letters of administration* is that the applicants must make a *valuation* of the various kinds of property of which the estate consists; the value of each item is to be the value on the date of death. (It is not usually necessary to employ a licensed valuer, though this may be helpful if the estate includes valuable jewellery, antiques, or works of art.) An *Inland Revenue Affidavit*, for death-duty purposes, must be *completed* and *sworn before a Commissioner for Oaths*. This document is one of a number of printed forms (varying according to the nature and composition of the estate, and obtainable from Somerset House, the Estate Duty Office, and certain principal post offices). It is divided into headed columns showing (*a*) the descriptions and the values of the various parts of the estate (*e.g.*, cash at bank, Government securities, stocks and shares, furniture and effects, and so forth); a separate section shows (*b*) the funeral expenses and the debts which the deceased left owing. The *gross estate* consist of the items under (*a*); the *net estate* is calculated by deducting those under (*b*) from the gross total (the cost of a tombstone cannot be deducted).

In the simplest cases *estate duty* is payable on the *net estate*, according to a sliding scale; but no duty is payable on an estate of £3000 or less. (In all but the simplest cases it would be wise to consult a solicitor, as the law relating to estate duty is excessively complicated.)

Another part of the document sets out particulars of the deceased and of the applicants, and the kind of grant required. The document, when sworn, must be forwarded to the Estate Duty Office, who will *assess the duty payable* (if any) and interest on such duty from the date of death. This must be *paid in full* before proceeding further, *except* the part of the duty that relates to *freehold property*, which may be paid by instalments. (The deceased's bank will usually grant a loan or overdraft for the purpose of such payment.) When the duty has been paid the Inland Revenue Affidavit will be returned to the applicants receipted

The second document required is the *Form of Oath for Executors or Administrators*. This gives particulars of the deceased and of the applicants, as before, and declares *either* (*a*) that they believe the "paper writing" before them to be the deceased's *last will*, or (*b*) that the deceased died *intestate*; in either case they declare their *relationship* (if any) to the deceased, and the *capacity* in which they apply (*e.g.*, "the executors named in the will," or "the lawful widow of the deceased," or as the case may be); and they swear *to administer* the estate (the gross amount of which they mention) *according to law*, and to produce proper accounts whenever called upon to do so. This Oath must also be sworn before a Commissioner.

If there is a will it must now be signed (for identification purposes) by the applicants and the Commissioner for Oaths. If there is no will a third document is required, known as an *Administration Bond*. This is a printed form which must be completed and signed, sealed, and delivered (see D9 (2)) by the applicants and two *sureties*—*i.e.*, independent persons who are willing to *guarantee* that the applicants will carry out their duties according to law, under the *penalty* of forfeiting double the value of the estate if there is any default. (In practice, an *insurance company* will usually undertake *the duty of surety* for a reasonable premium, and in that event no other surety is required.) The Bond must be executed (*i.e.*, signed, sealed, and delivered by the individual

sureties, or sealed by the insurance company, and also signed, sealed, and delivered by the applicants) before a Commissioner for Oaths.

Finally, the applicants must take to the Principal Probate Registry at Somerset House, or to one of the District Registries outside London, (*a*) the receipted Inland Revenue Affidavit; (*b*) the duly sworn Oath for Executors or Administrators; (*c*) *either* the will (if any), duly marked with the signatures of the applicants and the Commissioner, *or* the Administration Bond, duly executed. If there is no hitch, the *grant of probate* or *letters of administration* will usually be posted to the applicants (or their solicitor) within about fourteen days.

(For the convenience of persons who have no legal adviser, there is a Personal Applications Department, situated in the Royal Courts of Justice, Strand, W.C.2, where the officials are extremely helpful in answering questions and showing applicants how to complete the forms. But in most cases trouble and delay will be avoided by employing a solicitor.)

II. Property in Land (Immoveable Property)

Although the *logical distinction* preserved in the legal systems of other countries is between property in land and buildings and property of other kinds ("immoveables" and "moveables"), English law has from an early date made the more artificial distinction between *real property* or *realty* (*i.e., freeholds*) and *personal property* or *personalty* (*i.e., leasehold* land and property of all other kinds). The reason is historical. In early times, if the possession of freehold land was withheld from its rightful owner his remedy was an action for recovery of the actual thing withheld—*i.e.*, the freehold land itself—and that very *thing* (in Latin, *res*) would be restored to the owner under an order of the Court. On the other hand, when property of other kinds (including leaseholds) was withheld from its rightful owner, his remedy was an action against the wrongdoer, in which the remedy would be the award of *damages* against the wrongdoer *personally* (*in personam*)—not an order for the restoration of the actual goods or other property withheld. Although that distinction in the remedies is no longer generally applicable, the terms (*realty* and *personalty*) have been retained.

1. Realty or Freehold Property.—The difficulties of this branch of the law are due principally to historical reasons which go back to the Feudal System. In a very practical sense that System recognised only the Monarch as the *owner* of land; those who held it from him were *tenants* (in French, "holders"). If the tenancy was one which was not limited to expire at the end of a fixed period it was known as "an estate in fee simple"—*i.e.*, a *freehold*; a tenancy which was for a fixed period only was known as "a term of years absolute," or a *leasehold*.

When the Feudal System came to an end this distinction remained. A freehold estate in land is still an interest which has *no fixed expiry date*; and the freeholder, out of that unlimited interest, can "carve," as it were, *fixed leasehold terms*, during which tenants will hold the land of him.

The property legislation of 1925 has profoundly changed and simplified the law. Until the end of 1925 one important characteristic of the freehold estate was that of *primogeniture*—the rule that, on the death of the freeholder intestate, the freehold passed intact to his *eldest son* or (if he left no son) to his eldest male heir. This was abolished by the Administration of Estates Act, 1925, which enacted that, in the event of a person's dying intestate after December 31st, 1925, the *whole of his property* (realty as well as personalty) should devolve upon his legal personal representatives (see D18); and that it should, as one whole, be sold and converted into money so far as necessary for the payment of the deceased's funeral expenses and debts, death duties, administration expenses, and for distribution among his next of kin. The eldest son, or heir, has no longer any special privilege.

Settlements.—On the other hand, a freeholder (whom we will call Charles), having a freehold estate in land—*i.e.*, an interest which has no expiry date—can *during his lifetime* create *successive interests* to take effect one by one. Charles can, if he so desires, *settle* his freehold estate to be enjoyed by himself during his lifetime; after his own death, by his eldest son George during that son's lifetime; then by his second son John, during John's lifetime, and finally by George's son Peter "in fee simple." The successive interests of Charles, George, and John are called *life interests*; the ultimate, future freehold interest, reserved for Peter to enjoy after the deaths of his grandfather, his father, and his uncle, is called a *remainder*. Both the life interests and the remainder are *rights of property* to which Charles, George, John, and Peter become *entitled immediately* the settlement is made—that is, they are *present rights* to the *future enjoyment* of the property, and those rights can be dealt with at any time, even before they "fall into possession." Since Charles, George, and John *must* some time die, Peter knows *now* that his freehold remainder *must* come, some time, to him or his personal representatives and, through them, to his next of kin (see above); for even if he dies young, while George and John are still alive, his right will not be "defeated" but will be preserved for those to whom his property may eventually pass under his will or intestacy. Therefore that *present right* to *future enjoyment* is a piece of property which Peter can deal with *now*, unless he is under twenty-one, or unless he is restricted by the terms of the settlement from doing so. George and John can, if they are so minded, do the same with their life interests—that is, they can *now* sell to another person, for hard cash, their present rights of future enjoyment, or they can mortgage (*i.e.*, pledge) those rights against a loan, on the understanding that they will get back those rights when the loan is repaid.

To watch over these successive interests, and to preserve the rights of the ultimate successor, Charles appoints *trustees* of the settlement, whose duty it is to act impartially by all the beneficiaries. A *trust corporation* (usually one of the bank trustee companies), which never dies, or *at least two individuals*, may act as trustees. The Trustee Act, 1925, provides for the appointment, by a simple procedure, of new trustees to take the place of those who die, become unfit, or unwilling to go on acting, etc. In the last resort the Chancery Division of the High Court (the guardian of equity) has power to make such an appointment; for "equity never lacks a trustee."

In order to enable landed property to be freely disposed of, it is provided by the Settled Land Act, 1925, that the person who is for the time being enjoying the current life interest (see above) has power to *sell the entire freehold* estate if he so desires. Nevertheless, the scheme of interests under the settlement is not defeated, for the purchaser from the tenant for life must pay the purchase-money not to him but to the trustees; they must invest the money in safe investments, and carry out the provisions of the trust with the necessary modifications. Each *tenant for life* will then receive the *interest or dividends* on the investments during his lifetime, just as formerly he would have received the rents and profits of the land during his lifetime; while the *remainder-man* (Peter) will ultimately come into the *capital* of the trust fund (*i.e.*, the investments themselves) in lieu of the freehold interest.

2. Leaseholds.—We have seen above that the freeholder, out of his estate which is unlimited in time, can "carve" fixed *terms of years absolute* or *leasehold* estates. These terms may be of any length; the most common are terms of 999 and 99 years. The document by which such a term is granted is called a *lease*; the person granting the term is the *landlord* or *lessor*; the person to whom

it is granted is the *tenant* or *lessee*. But the lessor, by the grant of a lease, has not given up *all* interest in the land. The lessor's freehold estate is unlimited in time; when, therefore, the leasehold term (however long) comes to an end, the right to possession and enjoyment of the land will *revert* to the freeholder. That right, known as a *reversion*, is again a *present right* to *future enjoyment* and, as such, a piece of property which the freeholder can, if he wishes, dispose of *now*. The "sale of a reversion" is, in fact, equivalent to the sale of the freehold subject to an existing lease; it confers upon the purchaser the lessor's right to receive rent from the lessee throughout the leasehold term, and at the expiration of that term to *repossess and enjoy* the land without limit of time.

The *lessee* has a *legal estate* in the land for a *fixed term* of years, and he in turn (unless prohibited by the provisions of his lease) can grant *sub-terms* to expire at any time before his own *head-term*. This is a process which can be repeated, in turn, by each lessee, underlessee, sub-underlessee, and so forth, who will become respectively the underlessor, sub-underlessor, and so forth, of the person to whom the next subordinate interest is granted. Thus Michael, the freeholder, by granting to James a term of 999 years, leaves himself with a *freehold reversion* which will revert, at the expiration of the 999 years, into the possession of the then freeholder. James, by the grant of an underlease, can carve (out of his leasehold term of 999 years) a sub-term of 99 years in favour of William, whose underlessor or landlord he becomes, leaving himself with a *leasehold reversion* of 900 years. William, in his turn, can grant to Anne a sub-underlease for 21 years, leaving himself a *leasehold reversion* of 78 years, and so forth. The relationship of lessor and lessee, or landlord and tenant, subsists between William and Anne, James and William, Michael and James; this relationship is one of *privity of estate* as well as *privity of contract*. The former phrase means that each of these pairs of individuals is linked by their *mutual interest in the same term of years* as above described. The latter phrase, *privity of contract*, means that the *link is contractual*—it arises from the agreement between Michael and James contained in the headlease; the agreement in the underlease between James and William, and that in the sub-underlease between William and Anne. But between Anne and James, between William and Michael, there is no relationship of any kind, neither of contract nor of estate; Michael can look only to James, James to William, and William to Anne, to carry out the terms of the respective tenancies.

In certain circumstances, however, there may be *privity of estate* between two parties without *privity of contract*. Suppose Michael *conveys* (*i.e.*, transfers) his freehold reversion, *during the subsistence of James's lease*, to Robert. Thereby Robert will take over all Michael's rights; *i.e.*, he will become lessor, in place of Michael, to James as lessee, as well as being entitled to possession of the freehold when James's lease expires. Between Robert and James there will be *privity of estate*, arising from their mutual interest in the term of 999 years (as lessor and lessee respectively); but there is between them no *privity of contract*, for Robert and James have made *no agreement* with one another. The distinction may in certain circumstances be important.

The Form and Contents of a Lease.—A lease for a term of more than three years must be made by deed (D9 (2)) between the lessor and the lessee. It names and describes the parties, and sets forth that, in return for an annual *rent* (and sometimes on payment, in addition, of a lump sum called a *premium*), the lessor *demises* (*i.e.*, lets) to the lessee, for a term of so many years from such and such a date, the land in question with the buildings erected thereon. (In the law of property the buildings go with the land on which they stand.) Then follow the *lessee's covenants*—the promises which he is to perform: to pay the rent by stipulated instalments, on certain dates; to pay rates, taxes, and other outgoings on the property; to put and keep the property in full repair; to paint the inside and the outside of the buildings at stated times; to keep the property insured, to its full value, in the names of the lessor and himself; to permit the lessor periodically to inspect the condition of the property; to carry out repairs which the lessor, as a result of such inspections, may call upon him to carry out. These are some of the stock clauses; but every individual lease must be carefully studied in order to ascertain what the lessee's obligations are.

Next come the *lessor's covenants*—the promises which the lessor is to perform; the chief of these is that, if the lessee carries out his part of the bargain, the lessor will permit him "quiet enjoyment" of the property without disturbance during the term. Some leases also contain *stipulations* binding on both parties; for example, a *stipulation* that the rent shall be reduced or suspended if the property is damaged or destroyed by fire, and sometimes an arbitration clause. At the end of most leases comes a *proviso*, for the protection of the lessor, to the effect that he shall be entitled to expel the lessee, and to re-enter and repossess the property, if the lessee ceases to pay his rent or to perform his covenants as required, or in the event of the lessee's bankruptcy.

One copy of the lease (the *original*) is signed, sealed, and delivered (D 9 (2)) by the lessor, and handed over to the lessee as evidence of his *title* to the leasehold interest. The other copy (the *counterpart*) is signed, sealed, and delivered by the lessee, and handed over to the lessor as evidence of his entitlement to the rent and to the performance of the covenants by the lessee. The counterpart requires a stamp (impressed by the Stamp Duty Branch of the Inland Revenue) of only five shillings; but the original must be stamped at the rate of £1 for every £50 of the rent (in addition to £2 for every £100 of the premium, if any).

(*Note. Landlord and Tenant.*—In earlier editions of this work much space was devoted to the subject of *Rent Restriction*. Between the First World War and the summer of 1957 the common law rules applicable to the landlord and tenant relationship were modified on innumerable occasions by Acts of Parliament, particularly the Rent Restrictions Acts. These Acts, because of the shortage of housing accommodation, provided an elaborate code to prevent landlords from taking advantage of that shortage; they "controlled" all dwellings up to a rateable value of £100 a year by providing, broadly speaking, certain limits beyond which rents could not lawfully be increased, and by giving tenants security of tenure after their contractual tenancies came to an end.

The subject has now lost a good deal of its importance, since, by the Rent Act, 1957, such control is abolished for dwellings above a rateable value of £40 a year in London and £30 elsewhere, and power has been reserved to the Minister of Housing to decontrol those still controlled, as and when he thinks fit, by ministerial order, without further legislation. So many complications are likely to arise in the transitional period that landlords and tenants will be wise to seek legal advice in cases of doubt. To attempt to summarise the position at this stage would be confusing and dangerous in the extreme.)

3. Mortgages.—The word *mortgage* is Norman-French; its literal meaning is "dead pledge." The process of mortgaging land and buildings is roughly analogous to that of pawning a piece of jewellery as security for a loan of money—with the important difference that the land cannot, of course, be physically handed over to the lender (as can the jewellery) to be kept in his custody until the loan is repaid. But a pledge and a mortgage have this in common—that the parties intend no change of *ownership*; the *borrower* (or *mortgagor*) is and remains *owner* of the property *after, as well as before, the transaction*. In exchange for a loan of a certain sum, the lender (or mortgagee) temporarily enjoys a *charge* upon property worth (it may be) much more than that sum, as *security* for the repayment of the loan, with the stipulated interest, at the stipulated time. The *borrower* is still the property-*owner*.

Because of the essential immoveability of land, the mortgage transaction is effected by a *mortgage deed*, which sets out the terms on which the loan is granted. Generally speaking, the borrower (or mortgagor) is permitted to remain in *possession* of the mortgaged property unless and until he fails to pay an instalment of interest or to repay the capital when called upon, or unless and until he breaks some condition of the mortgage deed. In early times such failure was often the signal for the lender (or mortgagee) to oust him *permanently* from possession, and even to deprive him of *ownership* of the property. But the courts of equity (as we have seen, D4 (2)) gradually evolved the rule that it was unconscionable for the lender to enrich himself, at a low cost to himself, from a transaction in which the intention of the parties was to *pledge the property temporarily* as a *security*, not to sell it permanently for a small sum. Hence was evolved the concept known as the *equity of redemption*—the rule that, even *after the legal date* fixed by the deed for repayment of the loan and for freeing the property from the mortgage, the borrower should still remain entitled to *redeem* the property (*i.e.*, to free it from the charge) by tendering to the lender the balance of the loan, with all interest and costs to date; and that the lender should thereupon be *bound* to give the borrower full and unfettered rights over the property, free from all the conditions of the mortgage, and in the same state as it was in originally. The lender (or mortgagee) must get no collateral (or additional) advantage of a permanent kind once the loan, interest, and costs were paid off; and this is still the law today.

The law, as stated above, has established the principle that the borrower who mortgages his freehold or leasehold interest, as security for a loan of money, shall not be deprived of his ownership, but shall retain such ownership after the execution of the mortgage deed. That deed is, in the first place, a *contract or agreement* under which the borrower promises to repay the loan to the lender, with interest at a certain rate, in one sum or by instalments, and meanwhile, for the lender's protection, to keep the property insured, in proper repair, and so forth. But that is not all; it is clearly important that the lender (the mortgagee) should, in addition, be granted an interest *in the property itself*—an interest which will enable him to take actual *possession* of the property, if need be, to enforce his rights, much as the pawnbroker has the right to *possession* (though not *ownership*) of the pledged article until the loan is repaid.

The Law of Property Act, 1925, devised a method of giving the lender (the mortgagee) a legal estate in the property while still preserving the rights of ownership of the borrower (the mortgagor). That Act provides that the grant of a mortgage of land, in *whatever form* it is effected, shall confer upon the lender (the mortgagee) *a term of years absolute*—*i.e.*, a *legal estate* in the *land itself*, which the mortgagee can deal with by sale, and which will be transmitted, as an interest in land, to his legal personal representatives upon his death. It is further provided that, on the final discharge of the mortgage (*i.e.*, the repayment of the loan, with all interest and expenses due to the mortgagee), that term of years shall *cease and be extinguished*, the mortgagor thereafter continuing to hold his freehold or leasehold estate *free from the mortgage term of years*, and free also from all the conditions of the mortgage deed.

In such a scheme it was necessary to distinguish the term of years conferred by the mortgage from any term of years absolute which might be or might have been conferred upon a lessee or underlessee by way of a lease or tenancy (see above, *Leaseholds*). For the purpose of such distinction the Act provides that, if the mortgagor's legal estate is a *freehold*, the mortgage deed confers upon the mortgagee a *term of 3000 years*, thus leaving to the mortgagor a legal *reversion* to commence after the expiration of that term (since the freehold estate is not limited to expire at any particular time). And if the mortgagor's legal estate is a *leasehold*, due to expire at the end of a fixed period, the mortgage deed confers upon the mortgagee a *term of years to expire ten days before* the leasehold term, thus again leaving the mortgagor with a legal reversion (in this case of ten days only).

In this way each party has a legal estate in the *land itself*, quite apart from the *contractual* rights and obligations in regard to the loan, which can be enforced by and against him *personally*. The mortgagor can sell his freehold *subject to the mortgage term* and the obligations of the mortgage deed; the mortgagee can *sell his mortgage term* with the benefit of the rights that go with it. The sale of a freehold (whether subject to a mortgage or not) is effected by a deed called a *conveyance*; the sale of a leasehold is effected by a deed called an *assignment*. The mortgage term can be dealt with in a deed called a *transfer of mortgage*. In every case the purchaser takes over the vendor's legal estate in the land, subject to, or with the benefit of, the personal obligations or rights in the original deed. In case of the death of the mortgagee or mortgagor, the legal estate in question, and the rights or obligations, are transmitted to his personal representatives.

Finally, it should be mentioned that, as an additional safeguard, the *title deeds* (evidencing the mortgagor's freehold or leasehold title) must be handed over to the mortgagee when the mortgage deed is executed, as part of the latter's security. The mortgagor must take care to get them back when he *redeems* the property by paying off the loan, interest, and expenses.

4. Title.—(a) *Evidence of title.*—Before freehold or leasehold property changes hands, it is the duty of the purchaser's solicitor to *investigate title*—*i.e.*, to satisfy himself that the vendor has a proper title himself and a proper right to convey or assign. Generally speaking, the purchaser's solicitor must go through the deeds (evidencing sales, transmissions on death, grants of leases, grants and redemptions of mortgages) for at least *thirty years back*; he must check every step in the *devolution of title* (*i.e.*, every change in ownership) and make *requisitions* (*i.e.*, demand explanations) on any point which is doubtful. This is still the system over the greater part of the country.

(b) *Registration of Title.*—With a view, however, to simplifying such procedure the Land Registration Acts have provided for a different system. In areas to which an Order in Council has made the system applicable, *registration of title* is *compulsory* upon any sale of freeholds, or of leaseholds having more than forty years to run. Registration is effected in the following way: the Government lawyers at H.M. Land Registry, in Lincolns Inn Fields, London, W.C. 2, investigate the title of every freehold or leasehold sold after the appropriate date, *once and for all*. If they are satisfied that it is in order, they register the owner as *registered proprietor* of the land with *absolute title* to his freehold or *good leasehold title* to his leasehold. (These kinds of titles indicate that the title is unexceptionable, but if there is a slight doubt the proprietor may be granted a *qualified title*; and if he is in possession of the land he may be granted a *possessory title*, which signifies little more than the fact of possession. The Chief Land Registrar is empowered, however, to convert both qualified and possessary titles into absolute or good leasehold titles, after fifteen years in the case of freeholds, and after ten years in the case of leaseholds.)

The Land Registry issues to the registered proprietor a *land certificate*, certifying (on behalf of the Government) that a registered title of the appropriate kind has been granted. In any further transactions relating to that particular land the purchaser's solicitor need not concern himself with the original deeds save in exceptional cases; he can generally rely upon the certified statements made in the *land certificate*, on which the name of the new registered proprietor is entered by the Land Registry officials when a *transfer* in his favour, or the grant of a lease to him, is lodged at the Registry. There are appropriate sections in the land certificate for

registration of a mortgage and the particulars of the mortgagee for the time being.

At the time of going to press, registration of title is compulsory in the Counties of London, Middlesex and Surrey, in the County Boroughs of Eastbourne and Hastings, in the City of Oxford, and in certain parts of Kent. But any land-owner elsewhere may voluntarily apply for registration of his title.

5. Joint Ownership.—If two or more persons are the owners of freehold or leasehold property, that does not mean that A owns one part of the land and buildings, and B and C other parts; the effect is that all of them *jointly own the whole*. (The analogy will be clear if the reader considers the case of a motor-car owned jointly by A, B, and C; clearly *all three own the entire car* between them; it cannot be said that A owns the engine, B the chassis, and C the body.) The Law of Property Act, 1925, recognises such joint ownership of land by means of a device known as a *trust for sale*. The respective rights of A, B, and C (equal or unequal) can be fully enforced only if and when the property is *sold* and the net proceeds of sale, in money, divided up in the proper proportions; and any or all of the joint owners can insist upon such sale or division for the purpose of obtaining their proper shares. But, while the property remains unsold, all the joint owners have rights according to the proportions of their shares; if, for example, the property is let, the net rents, after paying for repairs and other expenses, must be divided between them in those proportions. Up to four persons can jointly own a freehold or leasehold legal estate in land; if more than four are entitled to the *beneficial interest*, then four of their number only must hold the *legal* estate, and *equity* will enforce the *beneficial rights* of all against the legal owners. A purchaser from joint owners of the legal estate is concerned only with the latters' *legal title*; provided he hands over the purchase-money to them (not being less than two), or somebody authorised by them, *the purchaser is not responsible* for what they may do with that money. If those legal owners, from whom the purchaser buys, fail to pay over the proper shares to those *beneficially interested*, it is for the latter to enforce their rights against the vendors, who have sold the legal estate, by action in the Chancery Division, the guardian of equity. The purchaser's title to the land itself is not affected by the vendors' failure properly to carry out the terms of the trust for sale, so long as the *legal estate* has been properly transferred to him and he has paid the purchase-money to *not less than two* legal owners.

III. Property Other than Land (Moveables)

1. Chattels.—Chattels are *concrete things* which can be the subject of ownership, other than land or buildings, and other than objects so closely affixed to land or buildings that they are regarded as part thereof (*e.g.*, growing crops and trees, or "landlord's fixtures" built into some structure or so closely attached that they cannot be removed without serious damage to the structure).

In the ordinary way chattels can be *sold* or *given away* without any special legal formalities—merely by *physical transfer*—*i.e.*, by the owner handing them over to somebody else. If a chattel is to be *mortgaged* as security for a loan, the procedure differs according to whether the person pledging it (the borrower) is or is not to retain *possession* of the chattel. (His *ownership*, in either case is not disturbed.)

(*a*) If, as happens when an article is *pawned*, the borrower is not to keep the article in his possession, he hands it over to the pawnbroker, who hands him in exchange the agreed loan and a *pawn-ticket*. On production of the pawn-ticket, and the repayment of the loan with the stipulated interest, the borrower is entitled to receive the article back. (Provision is made by law for cases where the borrower defaults in payment, or where an unreasonable time elapses before he seeks to *redeem* what he has pledged.)

(*b*) If, however, the arrangement is that the *borrower* is to *retain possession* of the mortgaged article (as may happen if he borrows from a *moneylender* on the security of his furniture), then the borrower must execute and hand to the lender a document called a *bill of sale*. The law relating to such a document is extremely complex; but the most important provision is that the lender cannot enforce his rights unless he *registers* the bill of sale, at the Bankruptcy Court, in a register which any member of the public can inspect for a small charge. If then some member of the public desires to purchase the article from the person in whose possession it remains, but has reason to suspect that that person, though he may be the owner, has mortgaged it to a money-lender, it is open to the proposing purchaser to inspect the *register of bills of sale* to satisfy himself on the point. If he finds an entry against the owner's name, he will be wise not to proceed with the transaction. If he finds no such entry, and has no reason to believe the owner to be bankrupt, he can usually assume that there is nothing to prevent the person in possession from passing a good title to him.

2. Things in Action.—These (see D16 (1)) are *intangible rights* which can be owned and dealt with but, because of their abstract nature, cannot be *physically* transferred. If Brown owes Jones £50, Jones (the creditor) can transfer to Robinson the right to collect the £50 from Brown. Jones does this by a document called an *assignment* of the debt and (most important) by giving *written notice* to Brown (the debtor) that Robinson is now the creditor instead of Jones.

Similarly, if Jones owns ten shares in Brown & Co., Ltd., Jones will hold a *share certificate*—*i.e.*, a document certifying the amount of his shareholding. He has certain rights in the company, but these depend upon the company's *memorandum and articles* (D 8 (2)) and upon the *registration* of his name in the company's register of shareholders. The share certificate is only *evidence* of his rights—it is not in itself a piece of property, and the physical handing over of the certificate will effect nothing unless Jones executes a *share transfer* in Robinson's favour and Robinson sends it to the company for registration, together with the old share certificate in Jones's name. After *registration* of Robinson's name, the company will destroy the old certificate and issue a fresh one to him.

Again, if Jones has insured his life with the Brown Life Assurance Society, he will have received a *policy* which is *evidence* of the right of his legal personal representatives to be paid £1000 on Jones' death. If Jones wishes, during his lifetime, to transfer that benefit to Robinson, he can do so, but it will not suffice for him merely to hand Robinson the policy. To transfer the *rights* under the policy he must execute an *assignment* in which it is stated that Jones, being the policy-holder and entitled to certain rights thereunder, now *assigns* those rights to Robinson. But no transfer of those rights will have been effected until Robinson has *notified* the Assurance Society of what has been done and sent it the policy and the assignment for *registration* in its books.

These examples illustrate the principle, set out in the Law of Property Act, 1925, that an *unconditional assignment*, in writing, by a person (the assignor) entitled to any debt or other thing in action, in favour of another person (the assignee), if *notice in writing* is given *to the debtor* or other person on whom the obligation rests (in the above examples, to Brown, the Company, and the Assurance Society), shall entitle the assignee to all the assignor's rights, including the right to enforce those rights by action in the Courts, without calling upon the co-operation of the assignor in whom the right to the debt, or other thing in action, was originally vested.

DIVORCE AND OTHER MATRIMONIAL CAUSES

1. HISTORICAL SKETCH

The anomalies in this branch of the Law of England, and the legalistic attitude of the Courts to the subject, are principally due to historical reasons. For centuries the Church of Rome was the supreme ecclesiastical authority, and the law of that Church (Canon Law) applied to *matrimonial causes*—that is to say, disputes relating to any marriage and the mutual rights and duties of the spouses. Marriage was *indissoluble*—that is, there was no such thing as divorce in the modern sense of *breaking the legal tie*. But the Ecclesiastical Courts, which alone administered the matrimonial law before 1858, might for certain reasons grant a *decree of nullity* (a declaration that a particular "marriage" was null and void). In other cases they might grant what is now called a *legal separation* (known, in those days, as "divorce *a mensa et thoro*," *i.e.* banishment from bed and board); this latter decree, however, *did not dissolve* the marriage bond, but merely gave judicial sanction to the spouses' living apart from each other, and regulated the terms of the separation. After the Reformation the Ecclesiastical Courts continued to deal with matrimonial causes on the same legal principles as before.

As a result of the Acts of Supremacy passed in the reigns of Henry VIII and Elizabeth I, the Sovereign was declared to be the supreme governor of the Realm in all spiritual and ecclesiastical, as well as temporal, causes. This royal supremacy, exercised constitutionally through Parliament, was part of the law of the land; since there was no limitation upon the power of Parliament (see D5), special Acts were passed, from time to time, to effect that which neither the Ecclesiastical nor the Civil Courts then had jurisdiction to do, *viz.*, to break the marriage tie itself. A divorce of this kind, known as "divorce *a vinculo matrimonii*" (a divorce from the marriage bond) was rare, for the procedure was cumbersome and expensive. Except by the passing of a special Act of Parliament, there was no means of getting a marriage dissolved before the year 1858.

The Matrimonial Causes Act, 1857, transferred the jurisdiction in matrimonial matters from the Ecclesiastical Courts to the new Civil "Court for Divorce and Matrimonial Causes"; but perpetuated the old ecclesiastical practice with regard to nullity suits and judicial separation (formerly known as "divorce *a mensa et thoro*"). Apart from this rearrangement, the Act took the revolutionary step of conferring upon this Court a new judicial power—that of granting a *divorce in the modern sense* of a complete *dissolution of marriage*. As we have seen (D5), the Supreme Court of Judicature Act, 1873, and subsequent legislation, set up one single High Court of Justice, of which the Probate, Divorce, and Admiralty Division formed part, taking over (with other work) the jurisdiction which had been conferred in 1857 upon the "Court for Divorce and Matrimonial Causes." This jurisdiction remains in the hands of the Probate, Divorce, and Admiralty Division to-day. Great changes have been effected *by statute* (notably in 1923, 1925, 1937, and 1950) extending the grounds for divorce and the jurisdiction of the Court; but in the *interpretation and adaptation of principles* the great body of *case law* (see D4), which enshrined the principles and practice of the old Ecclesiastical Courts, is not without its influence to-day. The principles of equity (see D4), however, have not modified the strict legalism of this branch of the law; *equity has no application to the law of matrimonial causes* (except for resort to *injunction* (see D11) for the protection of the wife's person or property).

2. POWERS OF INFERIOR COURTS—SUMMARY JURISDICTION

Concurrently with the jurisdiction of the Divorce Division of the High Court, Magistrates' Courts now have power, by virtue of the Summary Jurisdiction (Separation and Maintenance) Acts, 1895 to 1949, to grant relief to the injured spouse in certain cases of matrimonial misconduct. The procedure is simpler, quicker, and less expensive than in the Divorce Division of the High Court. A Magistrates' Court may grant a *separation order* (which has the same effect as a High Court decree of judicial separation) and (in appropriate cases) an order for *legal custody of any child under sixteen* to either spouse. Where a *wife* is the applicant, a Magistrates' Court may also make an *order for maintenance* (maximum, £5 a week for the wife and 30*s*. a week for each child in her legal custody). Applications by a *husband* are limited to cases: (1) where the wife is an habitual drunkard or drug-addict; (2) where she has been guilty of persistent cruelty to the children; or (3) where she has been guilty of adultery. In case (1) the Court may order (with the wife's consent) that she be committed to and detained in "a licensed retreat for inebriates."

A wife may apply for relief in any of the following cases:

(1) Where her husband has been convicted summarily (*i.e.*, in a Magistrates' Court) of an aggravated assault upon her

(2) Where her husband has been convicted on indictment (*i.e.*, by a jury) of an assault upon her, and sentenced to a fine exceeding £5 or to imprisonment exceeding two months.

(3) Where she has been deserted by her husband.

(4) Where her husband has been guilty of persistent cruelty to her or her children.

(5) Where her husband has been guilty of wilful neglect to provide reasonable maintenance for her or her infant children whom he is legally liable to maintain.

(6) Where her husband is an habitual drunkard or a drug-addict.

(7) Where her husband, while suffering from a venereal disease, and knowing that he was so suffering, insisted on sexual intercourse with her.

(8) Where her husband has compelled her to submit to prostitution (or been guilty of such conduct as was likely to have, and has had, the same result).

(9) Where her husband has been guilty of adultery.

The Court may order that the *costs* of any application shall be paid by either party, as it thinks fit.

The general rule is that an *application* must be made *within six months* of the ground of complaint;

but this time limit does not apply to such continuing offences as desertion (see below) or wilful neglect to maintain. An application may be made to any Magistrates' Court acting within the district in which the cause of complaint wholly or partly arose, or in which the wife or husband ordinarily resides.

These "domestic proceedings," as they are termed, may be heard before one stipendiary (legally qualified magistrate) or two or three justices of the peace, including, so far as practicable, both a man and a woman. The *hearing* is *in private*, the public being excluded, and newspapers are prohibited from publishing details; "domestic proceedings" must be dealt with separately from other matters, and reports from probation officers may be received on the subject of any attempted reconciliation or on the means of the parties. In general, the magistrates should apply the same general principles as are applied in the Divorce Division; lay justices of the peace are advised on the law by their legally qualified clerk.

A *Magistrates' Court*, however, has *no power to grant a divorce* or *to annul a marriage;* the sole jurisdiction to make such a decree is in the hands of the Divorce Division of the High Court of Justice

An order may be enforced by committing the husband to prison if his failure to comply with the order is shown to be due to wilful refusal or culpable neglect.

No order is enforceable while a wife is *residing with her husband*, and *no order* may be made on the application of a wife where it is proved that she has been *guilty of adultery*, unless the husband condoned or connived at (see below), or by his wilful neglect or misconduct conduced to (*i.e.*, tended to lead to), the adultery. An *order already granted* will be *discharged* (*i.e.*, its effect will be terminated) on *proof of the wife's adultery*, or on proof that she has *voluntarily resumed cohabitation* with her husband.

If a matrimonial cause is pending in the Divorce Division of the High Court no application for a separation or maintenance order ought to be dealt with by a Magistrates' Court. And a Magistrates' Court may refuse to make any order when the suit in question would, in its opinion, be more conveniently dealt with by the Divorce Division.

Appeals. A Magistrates' Court has power "to state a case," upon *a point of law* (not a question of *fact*) arising on the application, for decision by a Divisional Court consisting of two or more judges of the Divorce Division. And an appeal from a Divisional Court lies to the Court of Appeal, by leave of either the former or the latter.

3. MATRIMONIAL CAUSES in the DIVORCE DIVISION of the HIGH COURT

(1) Constitution of the Court

The President of the Probate, Divorce, and Admiralty Division and not less than three other High Court Judges attached to that Division are the permanent judges for Matrimonial Causes. They sit both at the Royal Courts of Justice in London and at Assizes. Certain subsidiary duties are performed by the seven Registrars of the Principal Registry of the Division at Somerset House, and by District Registrars in the principal cities of England and Wales.

(2) Practice and Procedure

In contrast to "domestic proceedings" in Magistrates' Courts, the *Judges* of the Divorce Division sit normally in *open court*, though they have power to sit *in camera* (in private) where the ends of justice so require. In *nullity proceedings*, however, it is provided by statute that evidence on the question of *sexual incapacity* must be heard *in camera* unless the Judge is satisfied that the ends of justice require such evidence to be heard in open court. Press publicity is limited by statute to certain matters, and the publication of indecent matter may give rise to prosecution, in *any* matrimonial proceedings.

In general, practice and procedure in the Divorce Division are governed by statute, by rules of Court framed by a judicial committee under statutory authority, and by the principles and practice of the old Ecclesiastical Courts—except in proceedings for dissolution of marriage, which the old Courts could not entertain (see para. 1 above).

(3) Relief and Grounds for Relief

(a)—Nullity of Marriage. The Court has power to declare a "marriage" null and void in two main classes of case:

(i) *"Marriages" Void from their Inception —i.e.*, where one of the parties had *another husband or wife living* at the time of the ceremony; where there was a *mistake* as to the *nature* of the ceremony, or the *identity* of the other party; where one party had been declared of *unsound mind* and was detained as a lunatic at the time of the ceremony; where the parties were within the *prohibited degrees* of relationship (*e.g.*, brother and sister, or uncle and niece); or where the *ceremony was not in due form*, or was a mock "marriage."

(ii) *Marriages which are Voidable—i.e.*, which stand good unless and until one party or the other ("the Petitioner") successfully petitions the Court for annulment—*i.e.*, where either party was sexually *impotent at the date of the ceremony*; where either party has wilfully *refused to consummate* the marriage; where the marriage was *induced by threats* or fear or duress (*i.e.*, force), or where one spouse was *intoxicated* at the time of the ceremony.

The Act of 1950 has (somewhat illogically) added certain other grounds: (*a*) where either party was, at the time of the ceremony, in fact of *unsound mind* but had not been declared so, or was then a *mental defective*, or then subject to recurrent fits of *insanity or epilepsy*; (*b*) where the other spouse was, at the time of the marriage, suffering from *venereal disease* in a communicable form; and (*c*) where the wife was, at the time of the marriage, *pregnant by some person* other than the petitioning husband. But in these last cases (*a*), (*b*), and (*c*) the Court must not grant a decree unless it is satisfied that the petitioner was, at the time of the marriage, ignorant of the facts alleged; that the proceedings were instituted within a year of the marriage, and that there has been no sexual intercourse between the parties, with the consent of the petitioner, since he or she discovered that there were grounds for a decree of nullity.

Where a "marriage" is *void* (see above) the law regards it as *never having taken place* at all. Where it is *voidable*, the decree *annuls the marriage retrospectively* from its inception; but certain transactions between the parties while they actually

remained married are validated, and the Court has power to order maintenance for the woman; and *any child* who would in the normal way have been the legitimate child of the parties *remains legitimate*, notwithstanding the annulment.

Sterility—i.e., inability to produce children—is not, in itself, a ground for annulment of the marriage. If the *impotence* of one spouse appears to be *curable* without danger the Court may, before pronouncing a decree, require that opportunity for *cure* be first given. If he or she *refuses to undergo examination or treatment* the Court may infer, after hearing the other party's evidence, that impotence exists. The petitioning husband or wife may ask for a nullity decree on the ground of *his or her own impotence*, provided he or she did not know of it at the time of the marriage.

Apart from the one-year rule (mentioned in the last paragraph but two) in certain cases, delay (however long) in petitioning for nullity is no bar to the grant of a decree.

(b) Divorce.—(i) *Its Nature and Purpose.*—Divorce means the *breaking of the legal tie* of marriage by a decree of the Court. There is much controversy on the subject, some of it ill-informed, and much of it tinged with emotion and prejudice. It is not the purpose of this sub-section to take sides in the controversy, but (so far as possible) to remove misconceptions and to set out the various points of view.

We have to start by facing the unpalatable ruth that *some marriages do break down* in fact. The symptoms of break-down may be continual strife, and sometimes violence, between the spouses, so long as they continue to live together; or there may be an actual breaking-up of the home because one or the other finds the situation intolerable and leaves. The function of the law should be to deal with this state of affairs as best it can, paying due regard: (*a*) to the interests of the children (if any), who are innocent parties to the dispute: (*b*) to the interests of the spouses and of any third party involved; (*c*) to the interests of public decency and the safeguarding of family life generally.

The problem has suffered from over-simplification by the Press and the protagonists on either side. Sometimes it is represented (quite inaccurately) as a conflict between those who want divorce to be "easier" or "harder" to obtain. Sometimes it is said that divorce as an institution is "causing the break-up of family life." This is a superficial view, ignoring the true nature of the problem, and confusing effect with cause. Happily married couples do not seek divorce. Divorce is the drastic *remedy* provided by the civil law in the case of a marriage which has already *broken down in fact*; the availability of divorce does not bring about the break-down, any more than the availability of surgical treatment can be said to bring about ill-health. A marriage may break down—that is to say, the "kernel" of the marriage, the mutual respect and affection between the spouses, has withered away; only an empty shell—the legal tie—continues to subsist between them. How should this situation be dealt with by law?

It is common ground, among both the upholders of the orthodox view and those who advocate reform, first, that every possible effort should be made, by private individuals and public institutions, to effect a reconciliation, if at all possible. Such efforts are favoured by the law, and excellent work is done to this end by religious organisations, medical men, probation officers, lawyers, and such institutions as the Marriage Guidance Council.

Secondly, it is common ground that, if such efforts are unsuccessful and the *breach proves irreparable* in fact, the interests of the children (if any) should be paramount, and no pains should be spared to secure their proper care and maintenance. This is laid down by law; the Judge in a matrimonial cause may take the initiative in providing for the custody, maintenance, and education of the children, or for placing them under the care of the Chancery Division (see D5); whether the initiative is taken by the Judge or by one of the parents, the welfare of the children is the *paramount consideration*, irrespective of the rights and wrongs as between the parents. Nobody will deny that, once the marriage has broken down *in fact*, the children will suffer to some extent; but it does not follow that they would suffer less if the legal tie between the parents were preserved, or if the home, with its atmosphere of strife, and perhaps of violence, were kept together at all costs—even assuming such a thing were possible.

It is at this point that the main controversy begins. Where the "kernel" of the marriage has withered away, should the "shell"—the legal tie—be preserved or discarded? And if discarded, then in what circumstances and on what conditions? The present answer of the law is a not altogether satisfactory compromise.

The Christian Churches declare that marriage is not merely a civil institution but a religious sacrament, and the Roman Church regards it as indissoluble. This last is a matter of religious dogma and belief; not a question for rational argument. It is a view as deserving of respect as any other; but, as we have seen, it was abandoned by Parliament a century ago, and is unlikely to be reinstated in the civil law of England. Many churchmen regard this view as binding on their consciences, but it is no longer the law of the land. For better or worse, a marriage can now be legally dissolved, leaving each party free to contract another union if he or she so desires. On what basis, then, ought such dissolution to be granted?

This is the second stage of the controversy. The conventional view, the attitude of the present law, is that a decree of divorce can, and ought to, be granted solely as a result of some *matrimonial misconduct* by the "guilty" party, entitling the "innocent" party—and only the "innocent" party—to go to the Court for relief. According to this view, the decree of divorce (though in law a merely civil remedy) is regarded virtually as in the nature of a *penalty* upon the "guilty" party for his or her wrongdoing—a view that has survived from biblical times. The reformers consider this an anachronism and an anomaly, pointing out: (*a*) that in those times (as is the case under Jewish and Islamic law to-day) it was only the husband who could divorce his wife (not *vice versa*)—a step which was then a very severe punishment, since divorce meant, for the woman, disgrace, degradation, and poverty; whereas there is to-day little or no economic penalty or social stigma upon the "guilty" spouse, who is frequently no less—and often more—desirous than the "innocent" spouse of obtaining his or her freedom. The reformers further emphasise: (*b*) that the matrimonial law has never pretended to identify itself wholly with the doctrines of the Church; for example, the Book of Common Prayer declares, of marriage, that "first, it was ordained for the procreation of children"; yet not even the Ecclesiastical Courts went so far as to annul a deliberately childless marriage, and under the present law a refusal to have children is not a matrimonial offence and involves no penalty. Finally, (*c*) the reformist view is that the essence of the married state—the "kernel"—is the mutual respect and affection between the spouses; once that "kernel" has withered away and the marriage has *irretrievably broken down in fact*, the preservation of the legal tie is a mere pretence; the breaking of that legal tie, from the point of view of public decency, should be regarded as the necessary and proper result of the break-down of

the essence of the marriage, or the break-up of the marital home. Under the present system, a refusal by the "innocent" party to take proceedings for divorce, however malicious his or her motive for such refusal, cannot be questioned, and this makes for irregular unions and illegitimate births; on the other hand, the law's insistence that there must be an "innocent" and a "guilty" party inevitably induces two spouses, who find their union intolerable, to resort to unworthy subterfuges; under a more rational system (such as obtains, for example, in the Scandinavian states) both parties might amicably join forces to have the marriage dissolved, once it was quite clear that reconciliation was out of the question.

All these view-points, and others, were considered by the Royal Commission which heard evidence in 1951–55 and made certain recommendations in 1956; its Report, however, was by no means unanimous, and the law, by and large, remains unchanged. That is to say—only the "innocent" party, except in "discretion cases" (D29 (1)), can take proceedings for divorce against the "guilty" party; the law has sternly set its face against "divorce by consent" in any circumstances—if such consent comes to light.

(ii) *Grounds for Divorce.* The *Petitioner* (*i.e.*, the husband or wife who is *asking the Court for a divorce* against the other spouse) may present a petition on the ground that the *Respondent* (the other spouse):

(*a*) has since the celebration of the marriage *committed adultery*;

(*b*) has *deserted* the Petitioner *without cause* for at least *three years* preceding the presentation of the petition;

(*c*) has since the celebration of the marriage treated the Petitioner with *cruelty*; or

(*d*) is *incurably of unsound mind* and has been *continuously under care and treatment for at least five years* immediately preceding the presentation of the petition.

Further, a *wife* may petition for divorce on the grounds that:

(*e*) her husband has, since the celebration of the marriage, been guilty of *rape, sodomy*, or *bestiality*.

Finally, to cover those cases where one of the spouses has disappeared and not been heard of for many years:

(*f*) any married person who alleges that reasonable grounds exist for *supposing the other party to be dead* may petition the Court *to have it presumed* that the other party is dead and *to have the marriage dissolved.*

No petition for divorce on any ground may be presented *until the expiration of three years* from the date of the marriage, unless a Judge is satisfied that there is a case of *exceptional hardship* upon the Petitioner or *exceptional depravity* on the part of the Respondent. Whether there is such a case is a question for the Judge's discretion upon the evidence brought before him.

As to the above-mentioned grounds for divorce:

(a) *Adultery* means *voluntary sexual intercourse* between a husband and a woman who is not his wife, or between a wife and a man who is not her husband. (A woman who has been raped—*i.e.*, forced to have intercourse with another man against her will—is not guilty of adultery.) For obvious reasons, *direct evidence* of the act of adultery is rare, and the Court may infer from circumstantial evidence that adultery has taken place.

(b) *Desertion* means, primarily, the *intentional permanent abandonment*, by one spouse of the other, *without that other's consent*, and *without reasonable cause.* Therefore there is *no desertion* in such cases (for example) as: (i) where a husband *cannot* live with his wife because he is serving a sentence of imprisonment; (ii) where a husband leaves his wife for a *short time* for necessary business or family reasons, *intending to return to her*; (iii) while a *separation continues with the consent of both parties*; (iv) where the spouse who abandoned the other had *just cause* to do so.

Indeed, in certain cases under (iv) the doctrine known as constructive desertion may apply *against the other spouse*, if he or she has (figuratively speaking) *driven the first spouse away. Constructive desertion* means, not "desertion" in the literal sense of walking out of the matrimonial home, but conduct on the part of a husband which is intended to force, and virtually forces, his wife to leave him, or *vice versa.* Thus, if a husband brings his mistress to live with him in the matrimonial home and, as a result, his wife leaves him, not only is the wife innocent of desertion in the legal sense, but the husband is himself guilty of constructive desertion; it will be presumed against him that he intended to terminate his marital association, and he has in fact *carried out that intention.* Such a case illustrates the principle that there are *two elements* in the legal meaning of *desertion*—the *act* of physical separation and the *intention* to bring normal married life to an end.

In order to bring about desertion it is not necessary that the spouses should cease to live under the same roof; "desertion is not withdrawal from a place, but from a state of things." It is sufficient that the Respondent (the "guilty" spouse) has withdrawn from, or forced the other to withdraw from, *cohabitation*—*i.e.*, from sharing a common "home" in the full sense of the word. A wife "deserts" her husband if she refuses (against his will) to share his room, to take her meals with him, and to perform the usual duties of a wife. On the other hand, the mere refusal of sexual intercourse, in itself alone, does not amount to desertion.

It should also be noted that desertion is not a single act but a continuous state of affairs. The Petitioner must prove beyond reasonable doubt *that desertion without cause continued* during the entire period of *three years* required by law as the basis of a divorce petition. Although (see above) desertion in the legal sense must be *without the consent* of the petitioning spouse, recent judicial decisions have tended to dispense with the requirement that the deserted party must prove a *continuing desire* for the deserting party to return, and a *continuing willingness* to receive and reinstate the deserting party, during the *entire period of three years* preceding the commencement of proceedings; in other words, once the latter party's *original act and intention of deserting* has been proved, that intention is *presumed to have continued*, unless there is evidence to the contrary. But any kind of *agreed separation* is fatal to the case, whether the agreement be in writing, by word of mouth, or implied by conduct. An agreement, however, by a husband, who is *already living apart* from his wife, to *maintain* her and the children does not constitute a separation by agreement, unless there is evidence that the *wife actually consented* to his leaving her. A *maintenance order* made by a Magistrates' Court (see (D24 (2)) does not necessarily prevent the period of

desertion from running, unless the order contains a clause, deliberately inserted, to the effect that "the parties shall no longer be bound to cohabit."

If the deserting party makes an *offer to return* to the matrimonial home it is the duty of the other party to receive him (or her) back and to resume normal married life together, *if the offer to return is genuine* and if no other matrimonial offence (such as adultery or cruelty) has been committed by the deserting party. Whether such an offer is "genuine" is a question of fact, to be decided on all the evidence; it will generally be a wise safeguard for a deserted party who receives such an offer to *take legal advice* before accepting or rejecting it; for if rejection of the offer subsequently proves to have been unjustified, he (or she) may become the deserting party. This situation, again, arises from the legal view that "desertion" consists of two elements—the *act* and the *intention* of deserting.

An *honest and reasonable belief*, by one spouse, that the other spouse has committed, or is committing, adultery, if such a belief is induced by the other spouse's conduct, may be "just cause" for the first spouse to refuse cohabitation, and prevent him (or her) from being regarded as the deserting party.

(c) *Cruelty* is not defined by statute, but has been decided, in reported cases, to mean conduct causing danger to life, limb, or bodily or mental health, or giving rise to a reasonable apprehension of such danger. (The term "Mental Cruelty" is unknown to English law; but there may be *cruelty* in the legal sense *without physical violence*.) The Courts have refused to commit themselves to a comprehensive definition; *every case* must be considered on its *own facts* in the light of the whole history of the marriage. One single act, even of violence, can seldom be regarded as "cruelty"; but the conduct complained of must be of a *grievous nature*—not mere conduct which (however reprehensible) may be regarded as "part of the wear and tear of married life." In order to constitute cruelty, the conduct must be *intentional* on the part of the guilty spouse, *aimed at* the injured spouse, and calculated to break the latter's *health or spirit*. An *insane person*, who does not understand the nature and quality of his acts, and so cannot form the necessary "intention" (see D8), *cannot be guilty of cruelty*.

Drunkenness, in itself, is *not* cruelty; but if it is so *persistent*, or its effects so inevitably *distressing* to the other spouse, as to *threaten his or her health*, it may amount to cruelty. Similar considerations apply to persistent refusal of sexual intercourse, excessive sexual demands, or sexual malpractices either forced upon the other spouse or committed with third parties.

A *divorce petition* based wholly or partly on cruelty must *set out specifically the acts* complained of, evidence of which is to be given at the trial. (This ensures that the Respondent knows the details of the case he has to meet.)

(c) **Restitution of Conjugal Rights.**—Either spouse may petition the Court for such a decree where the other spouse has "wrongfully withdrawn from cohabitation" (see above). *Willingness to return* to cohabitation, *if genuine*, or *proof of just cause* (see above) for refusal are good defences. If the petition succeeds, and the Court orders the erring spouse to return, his or her *non-compliance* with the order *will not lead to enforcement* by arrest or otherwise; but it will (so to speak) fix upon him or her responsibility for the separation, and *establish* his or her status as the deserting party (see above). And *non-compliance* with a restitution decree is in itself *a ground* for the other party to petition for a decree of *judicial separation* (see below).

(d) **Judicial Separation.**—A petition for this form of relief may be presented by either spouse on the ground last mentioned in the foregoing paragraph, or on any of the grounds for which a divorce petition (see above) might have been presented. The *effect of the decree* (as in the case of a separation order made by a Magistrates' Court) is that the Petitioner is *no longer bound to cohabit* with the Respondent, and cannot therefore be regarded as a deserting party. (The *legal bond* of marriage *remains in force*; the procedure is therefore often employed by a spouse who does not desire divorce, perhaps for reasons of conscience, perhaps merely so as not to allow the other party freedom to marry somebody else.) It is, however, open to a Petitioner, who has obtained a decree of judicial separation, to petition for divorce, on the same facts, at a later date—*provided that three years have elapsed* since the date of the marriage (see D27 (1)).

Bars to Relief.—(1) *Absolute Bars.*—It is, by statute, the duty of the Court to investigate, so far as it reasonably can, the facts alleged in any petition for divorce or judicial separation, and to inquire whether there has been any *connivance* or *condonation* on the part of the Petitioner, and whether any *collusion* exists between the parties. *The Court must dismiss* the petition, and *refuse a decree, even in an undefended suit, unless* it is satisfied: (*a*) that the *Petitioner has proved his or her case*; (*b*) that the Petitioner has not been *accessory to or connived at* the adultery (if any) of the other party; (*c*) that the Petitioner has not *condoned* the adultery (if any) or the cruelty (if any) of the other party; (*d*) that the petition is not presented or prosecuted *in collusion* with the other party.

(a) *The Petitioner must prove the case*—that is to say, satisfy the Court that there are *proper grounds* for a decree *according to law*; there is no such thing, in suits for divorce and judicial separation, as judgment by consent, by admission, or in default of defence (as is possible, for example, in actions for breach of contract (D11) and tort (D12)). *In matrimonial suits* the *State*, and not merely the parties themselves, must see that the provisions of the law are *strictly observed*.

(b) *There must be no connivance*—that is to say, the Petitioner must not have intended *to promote or encourage or provide opportunity for* the commencement or the continuance of the Respondent's adultery. Merely *keeping watch upon a suspected spouse*, for the purpose of obtaining evidence, is not necessarily connivance; there must be active *encouragement or acquiescence*—wilfully "shutting one's eyes" to what is going on or likely to take place.

(c) *There must be no condonation* of adultery or cruelty—that is to say, *forgiveness* of all such acts as are known to, or suspected by, the injured spouse, and the restoration of normal marital relations with the offending spouse. ("Forgiveness" means forgiveness *on condition* that there shall be *no further matrimonial offence*.) Condonation may be by words or conduct. The Petitioner *cannot obtain a decree* on the ground of any offence or offences which he or she has *condoned*, except in case of *revival*.

Revival—If, subsequent to the condonation, the offending spouse again commits some matrimonial offence or offences, the former offence or offences are *revived*—*i.e.*, the effect of the forgiveness and restoration (see above) is cancelled, and

the former offence or offences will again afford a ground for divorce or judicial separation. It does not matter whether or not the new offence is of the same nature as the old; condoned adultery will be revived by new acts of cruelty or desertion; condoned cruelty will be revived by a new act of adultery, and so forth.

(d) *There must be no collusion*—that is to say, *no agreement* or *bargain* between the parties (whether for financial consideration or otherwise) that the Petitioner will commence or conduct a suit for divorce or judicial separation, or that the Respondent will not defend such a suit. There is, for example, *collusion* if one party *requests or suggests* that the other *should commit adultery* in order to provide evidence for a divorce, and the other party *accedes* to the request or suggestion. But it is not necessarily collusion for the Petitioner, knowing that *adultery has already been committed*, to ask the other party *for details or for evidence* on which the Petitioner can act. The Court regards financial arrangements between the parties with suspicion, if they are entered into *before the suit is commenced*, and it will carefully investigate such arrangements to satisfy itself that they are not collusive (*e.g.*, for the purpose of inducing the Petitioner to start proceedings). But once the petition has been filed, tnere is no objection to discussion between the parties, or their advisers, of necessary financial arrangements as to alimony or maintenance (see D30 (1)) or the disposal of the matrimonial home.

(2) *Discretionary Bars*—Apart from connivance, condonation, and collusion, any of which (as we have seen) is an *absolute bar* to the granting of a decree, the *Court has a discretion either to refuse or to grant* a decree of divorce or judicial separation, according to circumstances, if it finds that the *Petitioner* has himself (or herself): (*i*) been *guilty of adultery* during the marriage; (*ii*) *shown unreasonable delay* in presenting or prosecuting the petition; or (*iii*) been guilty of cruelty, or desertion without reasonable cause, *before* the Respondent's acts of adultery or cruelty on which the petition is based. The Court has a similar *discretion*, where the ground for the petition is *adultery, desertion*, or *unsoundness of mind*, either to refuse or to grant a decree to a *Petitioner* who has (*iv*) been guilty of such *wilful neglect or misconduct* as has conduced to (*i.e.*, helped to bring about) the Respondent's adultery, desertion, or unsoundness of mind.

In a case where each party is asking for a divorce against the other, each admitting his (and her) own misconduct and asking the Court to exercise its discretion in his (and her) favour, the *Court may exercise its discretion in favour of both* and dissolve the marriage.

In case (*i*) above, where the *Petitioner* has himself (or herself) been *guilty of adultery*, it is the Petitioner's duty to lodge in the Divorce Registry a *discretion statement*—*i.e.*, a written statement in a sealed envelope (to be opened only by the Judge at the hearing) admitting the facts and explaining the circumstances of his (or her) adultery. The *petition* in such a case must *contain a clause praying the Court* "to exercise its discretion in the Petitioner's favour." (*No details* of the Petitioner's adultery appear *in the petition* itself, thus preventing the Respondent from obtaining evidence of that adultery for use as a weapon against the Petitioner.)

Decree Nisi and Decree Absolute.—When the case comes on for trial the Judge will hear the *evidence of the Petitioner* and his or her witnesses, *and legal argument* on his or her behalf; *if the case is defended* by the Respondent spouse, or by the Co-respondent (*i.e.*, any *man* accused, in the petition, of adultery with a Respondent *wife*), or by any *woman named* in the petition as having committed adultery with a Respondent *husband*, the Judge will hear their evidence and legal argument on their behalf. The Judge, if not satisfied on points (*a*), (*b*), (*c*), and (*d*) (D28–9) in a case of divorce or judicial separation, must *dismiss the petition*, in which event the married status of the parties will remain unchanged. If the Judge *is* satisfied on the points mentioned he will, in a suit for *judicial separation*, pronounce a *final decree*; in a *suit for restitution of conjugal rights* he will *order* the deserting spouse to *return to cohabitation* (the effect of the decree and the order is described above, D28 (1)).

In a suit for *nullity* or *divorce*, the Judge will pronounce a decree *nisi*—*i.e.*, an order that the marriage is to be *annulled* or *dissolved* unless (*nisi*), before that event takes place, *some cause* is shown to the Court *why final annulment or dissolution ought not to be permitted*. Intervention for this purpose may be made by an official known as the *Queen's Proctor*, or by any member of the public. Such interventions after decree *nisi* are rare, but may be made on the ground, for example, that there was a collusive arrangement (para. (*d*) above) between the parties, or some other material fact, which was concealed from the Court at the hearing.

If such intervention succeeds, the decree *nisi* will be *rescinded* (*i.e.*, cancelled) and the parties will retain their former status. If there is *no such intervention*, or if such intervention is *dismissed*, then the marriage will be *finally annulled or dissolved* on application (on a special form), at the Divorce Registry concerned (not in open court), by or on behalf of the *Petitioner*, not earlier than *three months* after the decree *nisi* (unless the Court fixes a shorter time by special order). If the Petitioner does not make such an application, then the Respondent may do so after the lapse of a *further three months* (*i.e.*, six months after the date of the decree *nisi*), and the Court has power to grant or refuse such application or to deal with the case as it thinks fit.

The decree which *finally annuls or dissolves* the marriage is called a *decree absolute*. Unless and until it is granted, the marriage tie still subsists; the decree *nisi* does *not* terminate the status of husband and wife. But the *decree absolute* does terminate that status, leaving both parties free to marry again.

Incidental Matters

(1) **Custody and Maintenance of Children.**—Apart from the general power of the Chancery Division, as guardian of equity (D5), *to protect the person and the property of any infant* (D7) (even though there may be no matrimonial proceedings between its parents), and apart from the additional powers of that Division and of Magistrates' Courts, under the Guardianship of Infants Act, 1925, *to appoint a guardian or guardians for any infant*, and to make orders for either parent to have *access* to the infant (*i.e.*, to see it periodically) and for the infant's *maintenance*, the Divorce Division itself may make orders for the *custody, maintenance, and education* of the *children of the marriage* which is the subject of any matrimonial proceedings, and give directions for placing them under the protection of the Court, and for access to them by either or both of the parents. The expression "children of the marriage" includes children lawfully adopted by both husband and wife, children of a bigamous "marriage" which has given rise to nullity proceedings (D25), and also children born before the marriage of their parents and legitimated by that (subsequent) marriage. The Court may make such orders and give such directions at any time after proceedings have been commenced for nullity, divorce, judicial

separation, or restitution of conjugal rights; it may make interim orders, and give interim directions, from time to time *during the proceedings*. It is, however, *unusual* for the Divorce Division to make orders for custody of or access to any child *over the age of sixteen* (since such orders would be difficult to enforce).

In all such proceedings, in *whatever court* they may be taken, the *paramount consideration* is the *welfare of the children—not the punishment of the "guilty" parent, nor any privilege* of the father as against the mother, or *vice versa*. (It is, for example, unusual for the Court to deprive the mother of the custody of a very young child, even though she has committed or is living in, adultery —unless, or course, she is neglecting the child or is a "bad mother" in the widest sense.) In some cases, for good reason, both parents may be passed over, and the custody of the child may be given to some third party.

(2) **Financial Provision.**—(a) *Alimony Pending Suit.*—On any petition for nullity, divorce, judicial separation, or restitution of conjugal rights, the Divorce Division may make such *order* for *payment by the husband to the wife* of *alimony pending suit* (*i.e.*, a periodical sum for or towards her support *during the proceedings*) as the Court thinks just. The Court may also *order a wife Petitioner*, in a suit for divorce or judicial separation on the ground of the *husband's insanity*, to pay *alimony pending suit* for or towards the *support of the husband during the proceedings*.

(b) *Permanent Alimony* is the term used for similar payments which the Court may order the husband to make to the wife *after* the pronouncement of a *decree of judicial separation* on any ground, and such an order *in favour of the wife* may be made even where a decree has been pronounced *against her*. An order for *permanent alimony* may also be made *in favour of the husband* in a case where the *wife petitioned* for judicial separation on the ground of *his insanity*. *Permanent alimony* may also be ordered in favour of the wife where an order for *restitution of conjugal rights* has been made in her favour.

(It will be observed that, in all the above cases, the period during which the payment of *alimony* may be ordered is *while the status of marriage remains in being*.)

(c) *Permanent Maintenance* is the provision which the Court may order the husband to make in favour of the wife *after a decree absolute* of *divorce or nullity*—*i.e.*, for the period *after the married status has been terminated*. (The Court may, *in exceptional cases*, make an order for *permanent maintenance* in favour of a "guilty" wife.) In *one case permanent maintenance* may be ordered *against a wife* and *in favour of a husband*—where the *wife petitioned* for divorce on the ground of *his insanity*. The order may be for payment of a *monthly or weekly sum* during the *joint lives of the parties* (*i.e.*, so long as they shall *both* live), or for a capital sum to be invested so as "to secure to the wife such gross or annual sum of money, for any term not exceeding her life," as the Court thinks reasonable, in both cases having regard to "*her fortune* (if any), to the *ability of the husband*, and to the *conduct of the parties*." The amount of the order is therefore left to the *discretion of the Court*; and it may be varied by the Court from time to time as the circumstances of the parties change. (The words "conduct of the parties" show that, in fixing the payments, the Court does not necessarily regard the question of "guilt" or "innocence" as clear-cut on the one side or the other; it may take into consideration the *whole history of the marriage*. The Court also takes into account the *property and income* of *both parties*.)

(d) *Periodical Payments* may be ordered to be made, *by the husband to the wife*, on or after the making of a *decree for restitution of conjugal rights*, for the joint lives of the parties. The Court may order the husband to "secure" such payments as in the case of permanent maintenance. Where the *husband successfully applied* for the decree, the Court may order the wife, if she is "in receipt of any *profits of trade or earnings*," to pay to the husband, or for the benefit of the children, such part of those profits or earnings as it thinks reasonable.

Where a husband has been guilty of *wilful neglect to provide reasonable maintenance* for his wife or infant children, then, in any case where the wife might have petitioned for judicial separation, the Court may (on the wife's application) order the husband to make to her such *periodical payments* as may be just, and it may order the husband to "secure" such payments (as described above). (Thus, where there has been wilful neglect to maintain, on the part of the husband, the wife may apply for financial relief in the Divorce Division instead of in the Magistrates' Court; there is *no limit* in the Divorce Division to £5 a week, as there is in the Magistrates' Court (D24 (2)). And the wife may make such an application even if she does not wish to petition for a decree of nullity, divorce, judicial separation, or restitution of conjugal rights.)

(e) *Settlements.*—In any case in which the Court pronounces a decree for divorce or judicial separation by reason of the *wife's adultery, cruelty, or desertion*, the Court has power to order the wife's property, or any part of it, to be *settled* (D20) for the benefit of the innocent party, or of the children of the marriage, or both.

The Court also has power, after a decree for nullity or divorce, to vary the terms of any settlement which may have been made on the parties before or after their marriage; the variation may be made to benefit the children, or the parties or either of them, as the Court thinks fit.

(f) *Damages against Co-respondent.*—A husband who is petitioning for a decree of *divorce or judicial separation*, on the ground of his *wife's adultery*, may ask for an award of *damages against the Co-respondent* (*i.e.*, the man with whom she has committed adultery). Such a claim, which is comparatively rare nowadays, is usually tried before a judge and jury; the damages should be assessed so as to *compensate the husband*, so far as possible, for the loss of his wife where she has been seduced from his side by the adulterer.

(g) *Costs.*—The costs of the proceedings are *always in the discretion of the Court*, each case depending on its own facts. Generally speaking, however, the costs "follow the event"—*i.e.*, when a decree or order is made against a husband, he will usually be ordered to pay the costs incurred; costs, however, are rarely awarded against a "guilty" wife, but are not infrequently ordered to be paid by the Co-respondent (if any). An order for costs may be made, but rarely is, against the "woman named" in a petition as having committed adultery with the husband.

Note on Domicil.—It has been explained above (see D7) why the English Court will *not, generally speaking*, grant a *divorce* to a man who is *domiciled abroad*. Since the *domicil of a wife* is the same as *that of her husband* (even if she has not lived with him for many years), the refusal of the English court to accept jurisdiction has caused hardship in many cases. To mitigate this hardship the Matrimonial Causes Act, 1950, confers upon the Divorce Division an additional statutory jurisdic-

tion in the following cases, *in favour of a wife*, even if her husband is *not domiciled in England*:

(*a*) In *any* matrimonial proceedings, *other than* for a "decree of presumption of death and dissolution of marriage" (see below), if: (i) the wife has been deserted by her husband, or the husband has been deported from the United Kingdom as an alien; and (ii) immediately *before the desertion or deportation* the husband *was* domiciled in England.

(*b*) In proceedings for *divorce* or *nullity*, if: (i) the wife is *resident* (*i.e.*, actually living for the time being) in England; and (ii) has been *ordinarily resident* there for a period of *three years* immediately preceding the commencement of the proceedings; and (iii) the husband is *not* domiciled *in any other part of the United Kingdom*, or in the Channel Islands or the Isle of Man. (The two last-named territories have their own separate systems of law.)

(*c*) In proceedings for a decree of "presumption of death and dissolution of marriage": the husband is presumed by law (*for the purpose of ascertaining the wife's domicil*) to have died "immediately after the last occasion when she knew, or had reason to believe him, to be living." (Thus the wife can acquire an English domicil of her own as from that date.)

And, under the Matrimonial Causes (War Marriages) Act, 1944:

(*d*) In the special case of *marriages celebrated during the Second World War*, where: (i) the *husband* was, at the time of the marriage, domiciled *outside the United Kingdom*; (ii) the *wife* was, immediately before the marriage, *domiciled in England*; and (iii) the parties *never resided together* in the country which was the husband's domicil at the time of the marriage, the Divorce Division may deal with proceedings for divorce or nullity *as if both parties* were at all material times *domiciled in England*. (This provision was to cover the special cases of soldiers from the Dominions or Colonies, the United States or other foreign countries who, while stationed here during the War, married English girls and had to go back to their own countries, *leaving their wives behind*—in some instances without communicating with them again.)

RECENT CHANGES IN THE LAW

Since the above survey was completed, there have been certain important changes in the law, effected by Acts of Parliament:

A. By the Matrimonial Proceedings (Children) Act, 1958

1. The powers of the Divorce Division to provide for the *custody, maintenance, and education of the children* of the parties (D29 (2)) are enlarged to apply also to *a child of one of the parties* (including an *illegitimate* or *adopted* child) "who has been accepted as one of the family by the other party," as they apply to a child (whether legitimate or illegitimate) of *both parties*.

2. Where a husband has been *guilty of wilful neglect to provide reasonable maintenance* for his wife or infant children (D30 (2)), enabling the Divorce Division to order the husband to make *periodical payments* to the wife, the words "infant children" are to include any *illegitimate child* of *both* parties, and the Court may make orders for *custody of and access to* (D29 (2)) any such children. If the Court considers it in the *child's best interests*, it may order the periodical payments for the child's benefit to be made *to the child* itself, or *to some other person* on the child's behalf, instead of to the wife (D30 (2)).

3. The same Act contains further enlightened and much-needed reforms for the *protection of the children* in matrimonial proceedings (whether defended or undefended). The Court, generally speaking, is *not* to pronounce a decree of *judicial separation* (D28 (2)), or make *absolute* any decree for *divorce or nullity* (D29 (2)), unless and until the Court is satisfied *either*—

(*a*) that arrangements have been made for the *care and upbringing* of every such child under 16, and that such arrangements are satisfactory or the best that can be devised in the circumstances, *or*

(*b*) that it is impracticable for the party or parties appearing before the Court to make any such arrangements

But the Court *may* proceed without observing these requirements if: (i) there are *special reasons* against delay, and (ii) either or both of the parties have given to the Court a *satisfactory undertaking* to bring the question of such arrangements for the children before the Court within a specified time.

4. On any application to the Court for *special leave* to present a divorce petition *within three years from the date of marriage* (D27 (1)), the Judge must consider, not only the *possibility of a reconciliation* between the parties and the *interests of the children of the marriage* (which was his duty under the Act of 1950), but also the interests of any child referred to in para. A1, above.

5. Even if proceedings for divorce, nullity, or judicial separation are *dismissed*, the Court may still make provision for the custody, maintenance and education of any child referred to in para. A1 above, and may vary such orders from time to time.

6. Finally, the Court is given power, in exceptional circumstances, to commit the care of any such child *either*: (i) to a *county council* or *county borough council*, *or* (ii) to an *independent person* under the *supervision* (if the Court think fit) of a *welfare officer* or of a county council or county borough council.

B. By the Divorce (Insanity and Desertion) Act, 1958

1. The words "continuously under care and treatment" (in relation to a spouse of unsound mind) (D27 (1)) are to be interpreted *more liberally and more broadly* (in various ways) then has been the practice of the Court in the past.

2. A person who has *deserted* his or her spouse and is now of *unsound mind* may be regarded (for the purpose of divorce or judicial spearation) as *capable of forming the intention of continuing* the desertion, if the Court takes the view that the "deserting" party would in any event have stayed away (even if no unsoundness of mind had supervened). (*Note.* Hitherto the Petitioner has faced almost insuperable difficulties in such cases, since it is not normally possible to attribute to a

person of unsound mind the capability of forming any "intention" whatsoever (D8 (1)).

3. Where the Petitioner is seeking *divorce* on the ground of the Respondent's *desertion* without cause for at least *three years* preceding the presentation of the petition (D27 (1)), any *agreement for separation* (whether in writing or not), entered into before *1st January 1938*, shall be *disregarded* by the Court if either: (*a*) the Respondent *had already deserted* the Petitioner, or (*b*) the Court is satisfied that the *circumstances* in which the agreement was made would have amounted to desertion (*without cause*) by the Respondent but for the Petitioner's apparent consent, in the agreement, to a separation.

(*Note.* Desertion did not become a ground for divorce until *1st January 1938.* Some deserted spouses may have entered into separation agreements, inadvertently, *before* that date, and this provision is intended to mitigate hardship where there was (at that time) a genuine case of desertion but the case was ruined by the signature of a written agreement to live apart, or by some form of spoken words or conduct, on the part of the deserted party, appearing to signify consent to the separation.)

C. By the Maintenance Orders Act, 1958

1. Maintenance Orders *made by the High Court* (or a County Court) may be *registered in a Magistrate's Court*, which is given power to *vary* and to *enforce* such Orders. Maintenance Orders *made by a Magistrates' Court* may be *registered in the High Court*, which is given power to *enforce* such Orders. (The purpose of such registration is to make enforcement more easily effective; in some cases it may be more convenient for the wife to resort to High Court procedure; in others to procedure in the Magistrates' Courts.)

2. If the spouse (usually the husband) liable for payments under a Maintenance Order is a person *in employment*, and if his maintenance payments are at least four weeks *in arrear*, then the Court may make an *Attachment of Earnings Order*. This Order will *authorise and direct his employer to deduct from his earnings* certain sums (which the Court will specify), to be handed over *by the employer* to an official of the Court, who will pass them on to the wife as instalments towards the payment of: (*a*) the arrears, and (*b*) the amounts currently falling due under the original Maintenance Order. (*Note.* Hitherto the Courts have had no power to compel employers to collect such payments out of the defaulting husband's earnings; the wife's only remedy has been to ask for an order committing the defaulting husband to prison—a procedure which gave her *no financial redress* or assistance.)

The *Attachment of Earnings Order* will also specify the "protected earnings rate"—*i.e.*, the rate below which the Court thinks the defaulting husband's earnings should *not* be reduced by virtue of the authorised deductions. (*Note.* In other words, the Court will see that the defaulter is left with a reasonable part of his earnings to live on.)

D. By the Matrimonial Causes (Property and Maintenance) Act, 1958

1. The Court is given power to make an order against the Respondent (D27 (1)) for financial provision (D30 (1)) in favour of the Petitioner (D27 (1)) or the children, *either* at the time of the decree *nisi* (D29 (1)) *or* at any subsequent date; but the Court is not to disregard any delay on the part of the Petitioner in applying for such financial provision.

2. The Court is given power to set aside (*i.e.*, cancel the effect of) any disposition of property by a Respondent husband (or former husband) in favour of some third party, if that disposition of property has been made within the past three years (preceding the Petitioner's application for financial provision), and seems to have been made with the intention of defeating or frustrating the Petitioner's application. But no such disposition of property is to be set aside if it was made *for valuable consideration* in favour of a *person who acted in good faith* and without knowing of the Respondent's intention to defeat or frustrate the Petitioner's application. (*Note.* This will enable the Court to protect a wife, in certain circumstances, if the Respondent husband (or former husband) has (for example) transferred part of his property to his mistress, with the intention of defeating his wife's claim to maintenance, alimony, *etc.* Up to now the Court has had no power to remedy such action by a husband who has made a transfer of the kind *prior to* a Court Order for maintenance, *etc.*)

3. The power of the Court to order "reasonable provision for maintenance" out of the estate of a deceased person (D16 (2)), in a case where his will or intestacy does not leave his wife "reasonably" provided for, is now extended to benefit a *former wife* (*i.e.*, "a woman whose marriage with him was during his lifetime dissolved or annulled.") (*Note.* This definition is not limited to a former wife who was the "innocent" party in divorce proceedings; but the Court has a discretion to make or refuse the order, taking all the circumstances into account.) Such an order may be discharged, varied, suspended or revised at the suit of various interested parties.

4. The Court's powers under paras. 2 and 3 (above) are extended to protect: (*a*) a *former husband* whose former wife has divorced him, or obtained a judicial separation against him, on the ground of *his insanity* (D27 (1)), or (*b*) where the Court has ordered a settlement of the wife's property, or "periodical payments" out of her income, where there has been a decree for restitution of conjugal rights (D28 (1)).

5. The executors or administrators (D18 (2)) of the deceased spouse are not to be liable if, when a claim under para. 3 is made, they have already distributed the deceased's estate (provided they waited for 6 month after the Grant of Probate or Letters of Administration (D18 (2)); but the claimant under para. 3 can follow the property into the hands of a beneficiary and recover it (if it is still available) by means of an order under para. 3 (above).

6. Under the Married Women's Property Act, 1882, the Court was given power to decide in a *summary manner* (*i.e.*, by a rapid and simple procedure) disputes between any husband and wife about the *ownership of any property.* That power is now extended to cases where the respondent spouse *has been, but no longer* is, in control of the property, or the *claimant does not know* whether it is still in the respondent's control or not. The Court may order the necessary enquiries to be made; in appropriate cases it may also order property in the hands of the respondent, or of a third party, *to be sold*, so that the claimant may have his or her share paid out of the proceeds.

Education and Careers

INTRODUCTION.

AUNTS and uncles can be infuriating when they insist on asking what their nephews and nieces intend being when they grow up. The fact is that very few boys and girls do know, while they are still at school, what they want to be when they leave.

The following pages are written in an attempt to be helpful to nieces and nephews and to their parents, whether or not the great decision has yet been made. For those still undecided there are some hints about coming to a decision, and for those who are already inclining towards some job or career, there is practical advice not only about how to prepare for entry, what sort of examinations have to be passed but also what sort of studying may be required even after starting on the job.

The need to take great pains about selecting a job for boys and girls leaving schools in the 1960s is underlined by the lesson to be learned from the chart printed below.

NOTE ON GRAPH.—Taking 1956 as the base level, this graph shows the percentage increase in the numbers reaching the age of 15 in each year, up to 1973 in Great Britain.
The actual number for the year 1956 was 613,000; for 1962 (the top of the bulge) 929,000 is estimated, and for 1973, the figure is 805,000.

The lesson, of course, is that there may be too many children chasing too few jobs during the coming years, and each of those children would do well to realise that the ones with the higher qualifications, the ones who are better schooled or better trained for making themselves useful in a job, will be those to be selected for the job of their choice.

Once upon a time the only jobs for which the candidates needed training and testing by written examination were the Church, the Law, Medicine, and Teaching, and for all these the candidates had to go to University. Today there is hardly a trade and there is no profession which does not demand, not only a form of training, but a training which has to be tested by written examinations. These examinations may be taken while at school, but also they are often taken after leaving school, the candidate working either full-time, at a University or a Technical College, or part-time, while earning. It is particularly with this sort of job that this section will deal.

CHOOSING A CAREER

Some Personal Advice.—Before starting to deal with the groups of possible jobs, it would perhaps be helpful to say a word about how to decide what sort of work to go for. An old trick is to think of the answer to this kind of question:—

Likes

E.g., "Do I like working with people?"
"Do I like working for people?"
"Do I like working with animals or plants?"
"Do I like working with things?"
"Do I like 'Paper Work'?"

Attainments

E.g., "What standard will I reach at School?":—

Local Leaving Certificate.
U.E.I. or R.S.A. Examinations.
G.C.E. Ordinary levels in the subjects usually regarded as less difficult, *e.g.*, Geography, Art, Woodwork, English, General Science, Elementary Mathematics.
G.C.E. Ordinary levels in the more difficult subjects, *e.g.*, Additional Mathematics, French, Latin, German, Physics, Chemistry.
G.C.E. Advanced levels.
G.C.E. Scholarship levels.

Talents

E.g., "Have I any special talents for figures, for writing good English, for languages, for science, for drawing, for mending things, for making things with my hands?"

Disposition

E.g., "Would I be prepared to give up some of my leisure time to working for examinations?"

Some Suggestions.

Having thought about the answers to these questions, it is now time to make a rough survey of the jobs which exist today. These are given below under three main headings, and examples are given of jobs, each of which will probably require time to be spent, after leaving school, on working for exams.

Group One. Office Work.

Largely concerned with problems expressed in words or in figures.

Examples:

Accountancy.

Banks and Insurance Offices.

Solicitors' Offices.

Civil Service and Local Government Service.

Building Societies.

Librarianship.

Group Two. Practical Work.

Largely concerned with studying, designing, making, and repairing things.

Examples.

Mechanical, Electrical, Civil Engineering.

Surveying and Architecture.

Draughtsmanship.

Agriculture and Forestry and Horticulture.

Dentistry or Surgery or Medical Services, *e.g.*, Physiotherapy.

Laboratory Work.

Group Three. Social Work.

Largely concerned with contacts with other people, teaching them, advising them, observing them, persuading them.

Examples:

Salesmanship and Purchasing.

Teaching.

The Church.

General Medical Practice, *i.e.*, ordinary doctor.

Journalism.

The Armed Services.

The Police.

Hotel Management.

Nursing and Welfare Work, *e.g.*, Almoner or Probation Service.

The list of examples could, of course, quite easily be multiplied by ten, but those given are enough for the moment. Here is some advice to a boy or girl as to how to use them:

Having answered the questions and studied the lists, make a list of your own, of all the occupations which you think might attract you, and then read the passage about them later in this section.

Having done this, and having read some of the recommended books or pamphlets on them, then you *must* go and get some advice. This is most important; you really cannot afford to rely merely on written advice for something so important as your future. You ought to be able to get advice from your school—from the Head, or from your House Master or House Mistress, or from the member of staff in charge of Careers—but it has to be admitted that not all schools are very up to date about these things, and not all children feel the confidence they ought to feel about the advice given them by teachers; if this is so, there is always the expert available for every young person in Great Britain, and that is the *Youth Employment Officer*. In nearly all areas the Y.E.O. serves under the Education Committee, and he can be contacted therefore by writing to the Chief Education Officer for your area, whose address will be in your local Public Library. Of course, you can often contact the Y.E.O. through your school, and this is preferable, but not absolutely necessary. The great thing is to get his or her advice; it won't cost you anything, and it won't be biased, and you can be sure that he will do all he can, after a good long interview, to put you on the right track to your future. Of course you may feel, and some parents may feel, that even this is not enough, and if so there is always the National Institute of Industrial Psychology, 14 Welbeck Street, London W.1, whose Vocational Guidance Secretary will be able to help you choose your occupation. The fee for a lengthy consultation is twelve guineas.

EXAMINATIONS AND COURSES.

Examinations.—Before starting on any of the detailed requirements for those who are hoping for particular jobs, a general picture of the Examination Field may be helpful. The first important point to make clear is that a boy or girl does not have to have been at a Grammar School or at an Independent School in order to enter the Examination Field. A growing number of Secondary Modern Schools are offering examination courses which will be useful for those who want qualifications before leaving school, but even those who are not able to benefit by these while still at school, who may be in a Secondary Modern School where no external examinations are taken, or who may not be regarded by the school authorities as "up to taking" an examination, need not feel cut off from their opportunities. There is often the chance of continuing full-time education at a College of Further Education. If it is important to earn some money, there are plenty of jobs waiting for them in which, if they are prepared to work, perhaps in the evenings, perhaps on the one day per week, they are released by their employers (this system is known as the day-release scheme). By this means there are valuable qualifications they can get, and for which they can compete with those who have been to schools where examinations are the normal end to a school career.

It is important, too, not to be discouraged by an unsuccessful career at school; often boys or girls who have been hopeless in class will suddenly, after leaving school, begin to do work, perhaps in mathematics, which was quite beyond them at school, because they suddenly see the sense in learning the subject which only then they realise is connected with the work they want to do.

Some examinations are normally taken while at school; others, normally only after leaving. The commonest In-school examination is of course the *General Certificate of Education*, though it can also be taken by those who have left school, particularly in Technical or Further Education Colleges, but also through Correspondence Colleges (*see* E4).

Apart from the G.C.E. there are certain other examinations and certificates which are often prepared for through following correspondence courses; among these there are:—

Certificates of the City and Guilds Institute. The courses available through the Institute can be taken at Technical Colleges and are sometimes begun at school. More than three hundred subjects, mainly technical subjects, are available. The corresponding body (mainly for non-technical subjects) is the *Royal Society of Arts*; often their courses can be followed through Correspondence Colleges.

It will be noticed that many of these colleges prepare students to take examinations of various Professional Institutions; these examinations vary with each profession, and almost all of them have separate stages. Often it will be found that if a candidate has passed the G.C.E. at Ordinary level in certain subjects he can start the professional course farther on, that is to say he is "exempted" from one of the early stages of the course. With Advanced level still further "exemption" is often allowed.

University Degree.

The General Certificate of Education is also essential for anyone wishing to take a degree at a British University, and the details for qualifying for University entry are uniform, except that Oxford and Cambridge are a law unto themselves, and every Faculty of each University has its own special requirements concerning particular subjects passed at Advanced and Ordinary level, which is only to be expected. The minimum entrance qualifications are given below, but it is important to check with the Registrar of the University whether there are any special requirements. You need no "Street Address" for a University; simply write to the Registrar, The University, and then the name of the town or city.

SOME CORRESPONDENCE COLLEGES

The Bennett College Ltd., Sheffield.
British College of Accountancy, 20 Milton Road, Harpenden, Herts.
British Institute of Engineering Technology, College House, 29 Wrights Lane, W.8.
Civil Service Correspondence School, 10 Station Parade, High Street, S.W.12.
College of Estate Management, St. Alban's Grove, Kensington, W.8.
E.M.I. Institute, 43 Grove Park, W.4.
International Correspondence Schools, Kingsway, W.C.2.
Metropolitan College, St. Albans, Herts.
Nalgo Correspondence Institute, 1 York Gate, N.W.1.
National Institute of Engineering, 148 High Holborn, E.C.1.
Pitman Correspondence College, 20 Russell Square, W.C.1.
Rapid Results College, Tuition House, S.W.19.
The School of Accountancy, 2 West Regent Street, Glasgow, C.2.
School of Careers, College House, 29 Wrights Lane, Kensington, W.8.
University Correspondence College, Burlington House, Cambridge.
Wolsey Hall, Oxford.

Minimum Entrance Requirements for University and for Colleges of Advanced Technology:—

1. The candidate must have passed in English Language and in either four, or five other subjects.

2. The subjects must include:—
   (*a*) a language other than English;
   (*b*) either mathematics or an approved science (ask the Registrar about this if in doubt).

3. At least two of the subjects must be passed at Advanced level.

4. Candidates who offer only *four* subjects in addition to English language must pass at one and the same sitting in two subjects at the Advanced level and in one other subject at Ordinary level not related to the subjects offered at Advanced level.

A University degree is, of course, essential for doctors, dentists, surgeons; for almost all teachers of Grammar School standard; and in nearly all cases for those who hope to go into the Church of England. In nearly all other professions a degree is an advantage, and this is so even in the technical world.

Diploma in Technology. However, for those who are technically minded, and who are not attracted by study which has not much connection with the practical applications of their chosen field, there has recently been instituted a special *Diploma in Technology*, which has equivalent status to a degree. This entails four or five years' full-time study sandwiched in between long periods of working in the related industry. The "Dip. Tech." can be taken only at the *Colleges of Advanced Technology*, known familiarly as CATS. Here is a list of them:

Birmingham College of Technology.
Bradford College of Technology.
London:
  Chelsea College of Science and Technology.
  Battersea College of Technology.
Northampton College of Advanced Technology.
Loughborough College of Technology.
Salford Royal Technical College.
Cardiff: Welsh College of Advanced Technology.

In order to qualify for acceptance on a Dip. Tech. course, it is necessary to have almost the equivalent qualifications as for minimum University entrance: Advanced levels in mathematics and physics, and/or chemistry will probably be essential, though there will not be so much rigidity about the Ordinary levels.

National Certificate and National Diploma. There is also a means of entrance through the *National Certificate* and *National Diploma*, but it is safest to make enquiries concerning this mode of entry.

The National Diploma is awarded at the Ordinary level to students who have successfully completed full-time courses for two years from age 16; the *Higher National Diploma* is awarded after a three-year full-time course, starting at 18. These diplomas are usually worked for at Polytechnics or Technical Colleges, and are related to some technical career. The same is true of the *Higher and Ordinary National Certificates.* The O.N.C. is awarded to students who successfully complete three years' part-time day-release or evening courses while in employment; the H.N.C. requires at least a further two years' study under the same conditions.

The Higher National Diploma and Higher National Certificate can normally be taken at a *Regional College of Technology* or at a CAT; the Ordinary National Certificates and Diplomas, City and Guilds Examinations, and the courses run by various professional bodies are usually provided for in *Area Colleges.* In some places *Colleges of Further Education* provide courses which lead on to those taken in the *Area* or even the *Regional College.* *See* Chart (E5).

SCHOOL SUBJECTS AND CHOICE OF CAREER.

The courses available at various schools tend to become narrower after the pupil has reached the early teens, and narrower still after O level has been taken. There are some careers for which it is important to begin and to keep on with certain subjects at this stage. This does not mean that all other subjects should be dropped (on the contrary), nor does it mean that there are not a very large number of careers for which no particular specialisation is necessary, but it may be helpful to indicate the careers which are listed in this section, for which certain subjects ought to be studied seriously while at school.

Accountancy—Mathematics.
Actuarial work—Mathematics to a high level.
Agriculture—Biology.
Air Hostess—A foreign language.
Architecture—Mathematics and Art.
Army and R.A.F.—Mathematics.
Navy—Mathematics and Physics.
Banking—Mathematics.
Church—Latin and possibly Greek.
Dentistry—Mathematics, Biology, Physics, Chemistry.
Draughtsman—Mathematics and (if possible) Technical Drawing and Physics.
Engineering—Mathematics and Physics and (if possible) Technical Drawing.
Forestry—Biology.
Law (Barrister)—Latin.
Medicine—Biology, Physics, and Chemistry.
Merchant Navy—Mathematics.
Nursing—Biology.
Optician—Physics and Mathematics.
Pharmacy—Biology, Physics and Chemistry.
Photography—Mathematics and Physics.
Surveying—Mathematics.

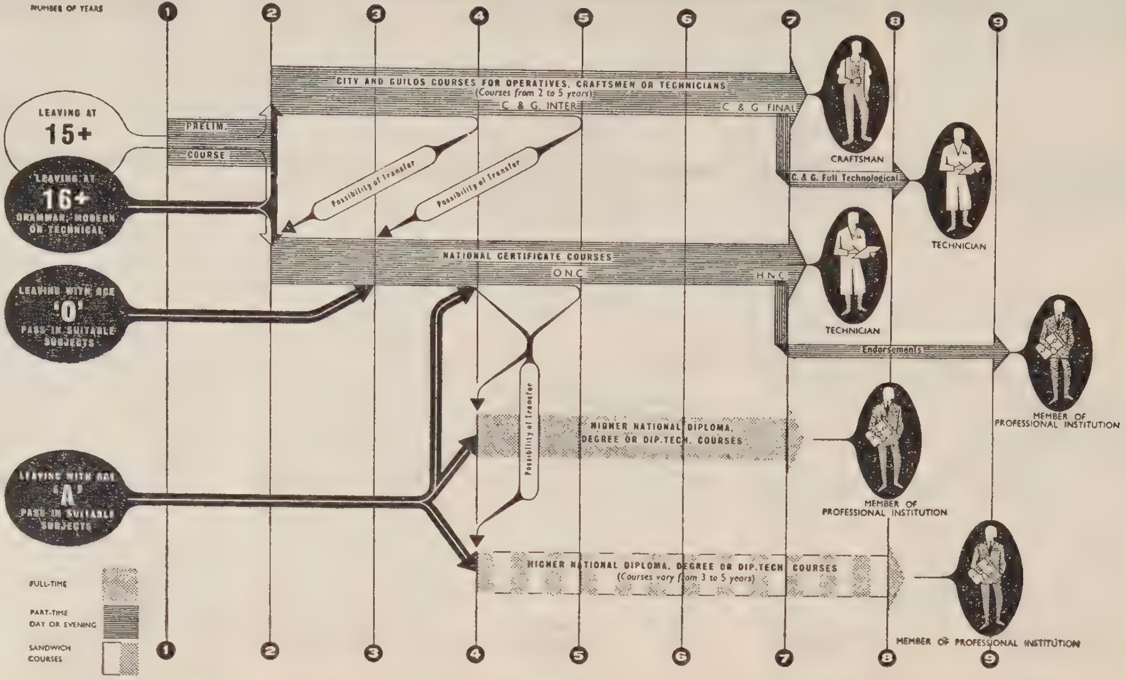
It will be noticed that there is a large number of careers which are described later on in this section which do not figure in the above list; this does not mean that they do not require special subjects to be studied at school. (For instance, very few professions allow entry without a pass in mathematics and English language at O level.)

It will be noticed too that, in the main, the subjects listed as essential above are mathematics and/or science.

In addition to the growing importance of mathematics or science, it should be noted that there is still a very large number of careers where, even if mathematics is necessary, no knowledge of science is required. Finally, even for those careers where a good knowledge of science and mathematics is required, as well as for those where it is not, ease of expression in written and spoken English, an understanding and knowledge of history and geography, acquaintance with a foreign language, are always important and useful, appreciated, and sometimes well rewarded by employers.

THE WAY TO TECHNICAL QUALIFICATIONS: A ROUTE CHART

THE ROUTES FROM SCHOOL TO TECHNICAL QUALIFICATIONS



This chart shows the broad pattern of courses and applies mainly to engineering subjects. It does not show all possible variations in the arrangement of courses in these and other subjects. (***Reproduced by permission of the Controller of H.M. Stationery Office.***)

TYPICAL APPRENTICESHIP SCHEMES IN ENGINEERING

SCHEME	AGE AND EDUCATIONAL STANDARD ON ENTRY	PRACTICAL TRAINING	FURTHER EDUCATION	CAREERS AFTER APPRENTICESHIPS
PROFESSIONAL SCHEMES: **GRADUATE**	21 - 25 DEGREE	BROAD EXPERIENCE IN WORKSHOPS, IN OFFICE DEPARTMENT AND IN CHOSEN FIELD OF ACTIVITY	POST GRADUATE LECTURES	RESEARCH or DESIGN or DEVELOPMENT, or PRODUCTION, or TECHNICAL SALES
PROFESSIONAL SCHEMES: **STUDENT**	18 - 19 G.C.E. 'A' LEVEL		COURSES FOR HIGHER NATIONAL CERTIFICATE or DIPLOMA IN TECHNOLOGY or UNIVERSITY DEGREE	
TECHNICIAN	16 - 17 G.C.E. 'O' LEVEL	BROAD EXPERIENCE IN WORKSHOPS AND OFFICES: SPECIALISED TRAINING IN SELECTED TECHNICAL DEPARTMENT	COURSES FOR ORDINARY NATIONAL CERTIFICATE or CITY AND GUILDS TECHNICIAN'S CERTIFICATE	LABORATORIES, or DRAWING OFFICE, or PRODUCTION, or TEST
CRAFT or TRADE	16 yr. (15 - 16 on probation) MODERN or TECHNICAL SCHOOL	GENERAL WORKSHOP EXPERIENCE: SPECIALISED TRAINING IN SELECTED TRADE	COURSES FOR CITY AND GUILDS CRAFT CERTIFICATE	SKILLED CRAFTSMEN e.g. TURNER, or FITTER, or FOUNDRY MOULDER, or ELECTRICIAN

[By courtesy of J. P. Freyne, Senior Lecturer, Battersea College of Technology.]

APPRENTICESHIPS.

An apprentice learns his trade while working at it; after a set period of years the apprentice becomes a skilled or a qualified person. Engineering is today the career where there are more apprenticeships than in any other trade, so the examples given below are taken mainly from engineering, but it should be remembered that many other trades now run apprenticeship schemes, but they are based on a similar system to that described here. *See* Chart (E6).

First comes the *Craft Apprenticeship*, taken up by a boy who has done well at a Secondary Modern or perhaps less well at a Technical School, and apprenticeship usually begins between the ages of 15 and 16; after a probationary period an apprentice is set to a particular trade, such as glass-blowing, tool-making, printing, or plumbing, and he is expected to study the theoretical background to his craft at the Technical College, working in most cases towards a City and Guilds or an Ordinary National Certificate.

Next in importance comes the *Technical Apprenticeship*, started at 16–17, which is sometimes known as the Student Apprenticeship; the standard of entry for this would be G.C.E. Ordinary levels in a number of subjects, including mathematics and preferably physics. These apprenticeships will lead to jobs as Draughtsman or Laboratory Assistant. Like the Craft Apprentices, the Technical Apprentices will study usually for one day per week at the Technical College, but they will hope for and expect a Higher Examination, such as Higher National Certificate.

Next comes the proper *Student Apprenticeship*, for which G.C.E. Advanced levels are essential, at least in mathematics and physics. Ultimately the aim of the student apprentices should be to qualify for the membership of a Professional Institution, such as the Electrical or Mechanical or Civil Engineers. The course may be followed through a day-release scheme, but more often today a sandwich course is arranged by which anything from three to six months is spent full-time at the college, and a corresponding time (full-time) at work. Higher National Certificate will be the first aim, followed by further work and study to obtain the full professional status.

Alternatively, and this is becoming more and more common, the student apprentice will start directly on a Dip. Tech. course, at the end of which only a certain amount of further industrial experience is necessary to achieve professional status.

Finally, there is the *Graduate Apprenticeship*, which is entered after the University and which serves as an introduction for the graduate to the practical side of Industry.

FINANCIAL AID TO STUDENTS.

Nowadays no one who is able to continue studying either at school or after leaving school should be put off by fear of financial difficulties. It may, of course, be frustrating for the fifteen-year-olds, or for the Sixth Formers or for the Evening Class Students, to see their contemporaries earning good money or having a good time while they are studying, but frustration turns to jubilation when the last exams are finished with, and when the much-desired and valued qualifications are leading the former victims not only to better paid but to more interesting work.

School Maintenance Grants.—It may be a question of staying on at school to take Ordinary or Advanced level examinations; students are not yet paid for this, but in some cases parents are; widows and those whose income is equally low are often eligible for maintenance grants (to maintain a child at school), which for a sixteen-year-old may be as much as £80 per annum. Application for such grants should be made to the local Education Officer. It should not be forgotten either that an income-tax allowance of £150 is granted for each child over 16 who is in full-time education.

University Grants.—After school, university grants are available from the County, or County Borough, Education Authority for most students who are good enough to be accepted by a University (*see* E4 (1)). They are normally quite sufficient to keep a student at University without relying seriously on their parents for help. Applications should be made normally in the final school year, and the Head of the School should be seen about these. State scholarships for University study are granted to those who do particularly well at the Advanced and Scholarship levels of the G.C.E., but, generally speaking, the holders of State scholarships are no better off, financially, than the holders of County Awards. Those who are good enough to get open Scholarships at either Oxford or Cambridge can be sure of automatically being given a State Scholarship without reference to other examinations.

Local Authority Grants.—There are other forms of further full-time study for which grants are available from or through Local Education Authorities, and these include grants for Teacher Training Colleges, and for study in Technical Colleges for qualifications in Architecture, Surveying, Librarianship; or in special training schools such as for Merchant Navy Cadets. Sometimes, however, study for some of these types of career is carried out on a part-time or sandwich basis, and the student is paid wages by his employer for the time he is studying as well as for the time he is working. As a general rule, if there is a choice between full-time or part-time study, full-time is the more advisable.

The Armed Services.—The Armed Services are very keen for study to be continued for as long as possible after school, and each branch of the Services runs its own Apprentice Schools (*see* E11, 12). The Army runs its own scientifically-biased University at Shrivenham, where students work for London University Degrees, and its own Sixth Form College at Welbeck. The Navy and Air Force offer valuable scholarships to future Sixth Formers to encourage them to stay on at school before going on to Dartmouth or Cranwell or Henlow; these are establishments for training officers, where cadets get well paid, and tuition is free. All enquiries about Services should be made to the Director of Recruitment of the branch concerned, the particulars of which are given under the heading *Armed Services* below.

Where to apply for Grants.—The sources to which parents should apply for grants are varied, and to compile a list of all the available awards and allowances would obviously require a junior encyclopædia to itself, and these remarks are meant only to give an indication of what may be done. Full details from any particular body should be obtained as follows:—

(*a*) County Authority—The Chief Education Officer.
(*b*) Large Firm—The Personnel Manager.
(*c*) Arm of Service—Director of Recruitment of the Arm concerned.
(*d*) University—The Registrar.

G.C.E. AND THE PROFESSIONAL BODIES.

Mention has already been made of the advisability of staying at school as long as possible and, in view of the remarks above indicating the possibilities of financial help for those who need it to continue their full-time education, it may be of interest to note some of the professional bodies which either *accept* the O level of the G.C.E. as providing exemption from their preliminary examinations or *require* the O level as evidence of preliminary education.

The number of subjects required varies slightly according to the professional body—but it is usually four or five, and in nearly every case English Language is an essential.

The professional bodies concerned are:—

The Association of Certified and Corporate Accountants.
The Institute of Chartered Accountants.
The Institute of Company Accountants.
The Institute of Actuaries.
The Advertising Association.
The Royal Institute of British Architects.

The Incorporated Association of Architects and Surveyors.
The Chartered Auctioneers and Estate Agents Institute.
The Institute of Builders.
The Building Societies' Institute.
The Royal Institute of Chemistry.
The Institute of Cost and Works Accountants.
The British Electrical and Allied Manufacturers Association.
The Forestry Commission.
The Royal Horticultural Society.
The Chartered Insurance Institute.
The Corporation of Insurance Brokers.
The Law Society.
The Library Association.
The Institution of Mining and Metallurgy.
The Institute of Municipal Treasurers and Accountants.
The Association of Occupational Therapists.
The Institute of Quantity Surveyors.
The Society of Radiographers.
The Rating and Valuation Association.
The Chartered Institute of Secretaries.
The Corporation of Secretaries.
The Royal Institution of Chartered Surveyors.

This is by no means a complete list, and full details about the detailed requirements for any particular professional body are set out in the Ministry of Education Circular No. 338, which also gives the addresses.

CAREERS FOR GIRLS.

Girls are difficult. They often don't like to show too much interest in their future careers, because this might make people think that they were not expecting to get married. Nothing could be more ridiculous. The girl who has a career, especially a career for which training is needed, is probably far more likely to make a good marriage, than the one who just drifts out of school into the first available job. Here are four reasons why this is so:

(1) The girl with a training will probably attract the better-educated man.

(2) If a girl has a job which holds her interest she may well find a husband who also works in the same field—a shared interest is a good basis for a marriage.

(3) The girl with a training will have something extra to give her children as they grow up, and so be a more satisfactory mother.

(4) The mother who has training qualifications can go back to her profession after her children have grown up; this not only has the advantage of adding to the family income, but means that an escape from the home to an outside interest is always available should the desire, or indeed the need, arise.

Giving advice to girls is a specialist task, and often the Youth Employment Officer either is a woman or has a qualified woman assistant who can help girls who are still at school. Further advice may be had from the Women's Employment Federation, 251 Brompton Road, S.W.3.

Careers open to girls today are no longer restricted to teaching, nursing and "secretarial," interesting and rewarding as these can be. Women can easily find jobs after being trained as accountants, engineers, and architects and, although most of us have yet to see a woman Bank Manager (there is one in the West End of London), the banks are more and more turning to women to take on responsible positions behind the counter, and often a specialist training in one profession or another, capped by a short secretarial course, can lead to some very interesting and rewarding positions as personal secretaries.

Finally, the advantages of a University degree to a girl who can and wants to continue her Sixth Form studies should be obvious, and no girl should be denied a University course just because it does not seem to lead to a job.

To avoid fruitless thumbing through jobs for boys only, here is a list of the jobs for girls, which are included in the next part of the section:

Accountancy, Advertising, Agriculture, Air Hostess, Almoner, Architect, Banking, Beauty Culture, Catering and Hotel Management, Child Care, Chiropody, Civil Service, Dentistry, Dietetics, Dressmaking, Engineering, Floristry, Hairdressing, Hospital Administration, Hotel keeping, Insurance, Journalism, Laboratory Assistant, Laundry Management, Law, Librarianship, Local Government, Medicine, Meteorology, Midwifery and Maternity Services, Museums, Music, Nursing, Occupational Therapy, Orthoptics, Personnel Management, Pharmacy, Photography, Physiotherapy, Police, Probation Service, Radiography, Secretarial work, The Services, Speech Therapy, Singing, Surveying, Teaching, Veterinary Surgery.

LIST OF CAREERS AND ESSENTIAL DETAILS.

How to Use this List.

1. The careers are listed in alphabetical order. those which are available both to girls and to boys have the letters **B. G.** beside them; if only boys are eligible, **B.**, if only girls, **G.**

2. Opposite the heading "Qualifications," initials have been used to indicate the following:—

Ordinary level of the G.C.E.	**O**
Advanced level of the G.C.E.	**A**
Ordinary National Certificate	**O.N.C.**
Higher National Certificate	**H.N.C.**

3. The indications of salary given are meant as a rough indication of what a young person may expect to start earning after qualification in the career concerned. In the rare cases where no qualification is required the starting salary is given. The upper levels of salary vary from job to job in many cases, and therefore often the upper end of the salary bracket has been omitted.

ACCOUNTANCY.

B. G.

Age of Entry. 16–18 or Graduate.

Qualifications. O or A or Degree.

Pay. £600 on qualification (£700–£800 in London Area).

Aptitudes. Ability in use of figures; capacity for prolonged attention to detail and clear expression.

Method of Entry.

1. Junior employment in Accountancy in either public service (*e.g.*, in local government) or industry.
2. As articled clerk (either in a firm of Accountants or in the Treasurer's Department of a Local Authority).
3. As a graduate in any of the above.

Further Study.

Intermediate Exam. of the Professional Body (after 2½ years).
Final Exam. of the Professional Body (after 5 years).

As the name implies, the accountant is the professional concerned with accounts of all descriptions in commerce, industry, and public affairs. The young person who starts on a five-year course of part-time study combined with daytime work as an articled or non-articled clerk must be prepared for a lot of hard work with comparatively little money at the beginning. During five years of training he or she will be expected to acquire a sound knowledge of the theory and practice of

Bookkeeping and Accounts, Auditing, Company Law, Law of Contract, Sales, Bankruptcy, Trusts, and related subjects.

The theoretical training is usually acquired from a correspondence course, although facilities are available in some areas at Local Technical Colleges. The cost of a complete course (including examination fees) is about £65, although this may be lower if Technical College courses are available.

Graduates entering the profession have three years only to serve under articles. Universities offering approved degree courses in Accountancy are Birmingham, Bristol, Cardiff, Durham (Newcastle Division), Hull, Leeds, Liverpool, London, Manchester, Nottingham, Sheffield, Southampton.

Once an accountant is qualified, advancement is very much a matter of his own initiative, record, and personality.

Note: Before starting on a course of study, it is essential to find out from the professional body concerned the exact nature of their requirements, as the details vary considerably.

Addresses of Professional Bodies.

The Institute of Chartered Accountants in England and Wales, Moorgate Place, E.C.2.

The Institute of Chartered Accountants of Scotland, 27 Queen Street, Edinburgh, 2.

The Institute of Chartered Accountants in Ireland, 7 Fitzwilliam Place, Dublin.

The Society of Incorporated Accountants, Victoria Embankment, W.C.2.

The Association of Certified and Corporate Accountants, 22 Bedford Square, W.C.1.

The Institute of Municipal Treasurers and Accountants, 1 Buckingham Place, S.W.1.

Institute of Cost and Works Accounts, 63 Portland Place, W.1.

Pamphlets.

Universities and the Accountancy Profession. Available from the Institute of Chartered Accountants.

Choice of Careers, No. 59 (H.M.S.O.), 9*d.*

ACTUARIAL WORK.

B. G.

Age of Entry. 16–18 or Graduate.

Qualifications. O or A or Degree.

Pay. £900–£1,250 on qualification.

Aptitudes. Ability in Mathematics. Must be able to develop powers of analysis and clear expression.

Method of Entry. Through Life Assurance Offices or Government Actuary's Department, either straight from school or as Mathematics or Economics Graduate.

Further Study. The professional examinations of the Institute of Actuaries, *i.e.*,

- Entrance Examination (Good A level G.C.E. exempts).
- Parts I, II, III leading to status of Associate.
- Part IV (combined with the above) leading to the status of "Fellow."

The Actuary is the expert on whom Insurance Companies rely for the calculations of insurance risks and the fixing of premiums. The would-be Actuary must be interested in and proficient at mathematics, which is going to provide him with the tools of the job. He (or she) must be prepared to continue part-time study in such subjects as Probability, Statistics, Finance, and Investment. For the qualified person there are plenty of openings at home and increasingly so overseas.

The Institute of Actuaries and their Scottish equivalent, the Faculty of Actuaries, run an Actuarial Tuition Service, which provides correspondence courses leading to the Associateship examinations of the bodies concerned. The cost of the tuition service amounts to between £35 and £40.

Addresses of Professional Bodies.

The Institute of Actuaries, Staple Inn Hall, High Holborn, W.C.1.

The Faculty of Actuaries, 23 St. Andrew Square, Edinburgh.

Pamphlets.

The Actuarial Profession. Available from the Institute of Actuaries.

The Actuarial Profession as a Career. Available from The Faculty of Actuaries.

Careers for Men and Women, No. 2 (H.M.S.O.), 6*d.*

ADVERTISING.

B. G.

Age of Entry. 16–18 or Graduate.

Qualifications. O or A or Degree.

Pay.

Juniors, £200–£250.
Trainees, £400.
Junior Copy Writers, £400.
Graduates, £650.

Aptitudes. Imagination; ability to mix and to express ideas briefly and to the point.

Method of Entry. By direct application to firm or agency on leaving school (or University).

Further Study. Study for the Intermediate and Final examinations of one of the professional bodies.

There is a great deal of competition for entry into this career, and the young man or woman wishing to go far will have to be prepared to learn while working and to develop a critical and independent mind. Nowadays much advertising work is carried out by advertising agencies, and it is by and large only the biggest organisations which carry their own advertising departments.

Agencies, in particular, have openings for specialists in the many activities connected with selling, *e.g.*, statistics, market research, commercial art, photography, technical production, and specialised overseas work. These specialists are often brought into the business after qualifying or training in another field (graduates for statistics, printers for space-salesmanship.) The potential recruit would therefore be well advised to think carefully whether or not it would pay to gain specialist experience elsewhere first. There is no truth in the idea that one can afford to run an expensive car in this career by virtue of the ability to think of a new catch-phrase every morning.

Although the examinations of the two Associations are not essential, the courses are a very good supplement to practical experience. The Associations have a Joint Intermediate examination, but run separate Membership examinations. In addition, the Institute of Practitioners in Advertising have an Associate Membership final examination designed for the "specialists" mentioned above.

Addresses of Professional Bodies.

The Advertising Association, 1 Bell Yard, W.C.2.

The Institute of Practitioners in Advertising, 44 Belgrave Square, S.W.1.

Choice of Careers Series, No. 44 (H.M.S.O.), 9*d.*

ALMONER.

B. G.

Age of Entry. 21+.

Qualifications. Diploma in Social Studies or Degree in Social Studies.

Pay. £525–£950.

Aptitudes. Tact, patience, interest in people, ability to express oneself concisely in writing.

Method of Entry. Acceptance by Institute of Almoners (as a result of personal interview).

Further Study. One year study—partly theoretical at Institute of Almoners—partly practical in hospitals throughout country.

The Almoner is usually a woman, although some men are nowadays taking up this work.

The work involves dealing with all the social problems that arise in connection with the sick. For example, worry about loss of income and care of children during sickness can seriously retard a patient's recovery. The Almoner is the person who gives advice on a score of problems. She must, for example, know where to go to find a home for a crippled lady whose sick daughter can no longer look after her; make arrangements for convalescence if required to do so; be able to give advice on finding financial assistance when a family's breadwinner can no longer work.

To carry out the duties properly, she must be able to size up and deal with people tactfully and patiently. It is the reports made by the Almoner which give the doctor a picture of the patient as a human being, which may be essential to the understanding of some cases and, anyway, is desirable in all.

This is by no means an overcrowded profession, perhaps because the pay is not outstanding when one considers the amount of training involved, but it is certainly one which can give deep satisfaction to those anxious to be of service to their fellows.

Address of Professional Body.

The Institute of Almoners, 42 Bedford Square, W.C.1.

The Almoner. Available from The Institute of Almoners.

Careers for Men and Women, No. 39, (H.M.S.O.), 1*s.* 9*d.*

AIR PILOT (CIVIL).

B.

Age of Entry. 18–20 (23 for Graduates).

Qualifications. A.

Pay. £1,100+ on completion of training (+ allowances).

Aptitudes. Highest standards of reliability, outlook, and physical fitness essential.

Method of Entry. Acceptance by the College of Air Training, Hamble, Hants.

Further Study. 2 years at College of Air Training.

The very high cost of becoming a Civil Airline Pilot privately has, until recently, made this an impossible career for nearly all except those who have been trained by the R.A.F.

Changes in the organisation of the R.A.F. and the end of National Service have meant that the Civil Airlines have been gradually losing their main source of recruits and there are now brilliant prospects for the young man who is good enough to secure a place at the new College of Air Training. The cadet will have a two-year residential course covering all aspects of flying, as well as general education.

Those chosen will be sponsored by one or another of the Airlines, and the cost to the student's parents will be no more than what they would pay if he were attending a normal University course with Local Authority assistance.

There is no need for any air-minded young man considering this career to fear that he may be left "grounded" at a comparatively early age, as the tendency is for the ceiling age for active pilots to rise. Given physical fitness, pilots may expect to fly well on into their fifties.

It must be emphasised, however, that competition for places is very keen, and only the very best type of candidate can hope to be accepted. The cost of training one cadet is between £4,000 and £5,000, and it is only to be expected that the Government and the Airlines, who between them provide the money, should take the utmost care to ensure that the number of cadets failing the course is reduced to the absolute minimum.

Addresses.

The Chief Personnel Officer, British Overseas Airways Corporation, H.Q. Building, London Airport, Hounslow, Middlesex.

The Personnel Manager, British European Airways, Keyline House, Ruislip, Middlesex.

The Ministry of Transport and Civil Aviation, Ariel House, Theobalds Road, W.C.1.

AIR HOSTESS (AIR STEWARDESS).

G.

Age of Entry. 21–28.

Qualifications. At least one foreign language.

Pay. £7 15*s.* per week (training) + £2 per week flying pay when trained. £570 p.a. after one year.

Aptitudes. Language ability, good diction, tact, and patience.

Method of Entry. Posts are advertised in National Press.

Further Study. Up to 13 weeks' preparatory training.

The girl who wishes to be an Air Hostess must be prepared to face very stiff competition. The competition is, in fact, so great that the Airlines are able to demand very high standards of turnout, poise, and personality.

The Air Hostess's work could be described as social work, as it involves not only the congenial task of handing round drinks and the food which has been prepared by the Air Steward but also catering for the many needs of the infinite variety of passengers, from babes in arms, sometimes unaccompanied, to worried old ladies who have mislaid their passports, or simply people who are feeling or being sick.

It is a great advantage to have had nursing and catering experience when applying for these posts. There is traditionally a high "wastage rate" of hostesses through marriage, but it should not be overlooked that for those who wish to make a long career with an Airline, promotion possibilities are good—Flight Stewardesses and Senior Catering Officers are recruited from the ranks.

ARCHITECTURE.

B. G.

Age of Entry. 18+.

Qualifications. A. Otherwise Intermediate or Final exam. of R.I.B.A. or equivalent or Degree.

Pay.

1. With Intermediate qualifications, about £600.
2. With Final qualifications, £800.

Aptitudes. Artistic ability, neatness and reasonable facility in mathematics.

Method of Entry.

1. As articled pupil or junior assistant to Architect.
2. 3-year full-time course at Technical College of School of Architecture, entering profession as assistant with Intermediate Exam. of R.I.B.A. or equivalent.
3. 5-year full-time course at School of Architecture, entering profession with Final Exam. of R.I.B.A. or equivalent.

Further Study.

1. If entering as articled pupil or junior assistant: about 7 years' part-time study, leading to Final Exam. of R.I.B.A.
2. If entering after 3-year full-time course: about 3 years' part-time study, leading to Final Exam. of the R.I.B.A.

Young people who do not feel an almost compelling desire to become architects, and who have little in the way of artistic gifts, are well advised not to consider architecture as a career. The student, however conscientious, who does not have an artistic flair, is unlikely to be particularly happy or successful. This is not meant to imply that the qualified architect has an exciting career of cathedral designing to look forward to. This there might possibly be at some time or another, but much of the time—especially at the beginning of a career—will be spent in routine work. Even the qualified person starts, almost without exception, in the office of an established architect or in the Architect's Department of a Local Authority. This is partly because the newly qualified have to gain 12 months' practical experience and take a final examination in order to secure registration with the Architects' Registration Council. Another reason is that Architects—like Solicitors—are not allowed to advertise, and so the young free lance would find the odds heavily against him in his initial attempts to find work.

Address of Professional Body.

Royal Institute of British Architects, 66 Portland Place, W.1.

Pamphlet.

Choice of Careers Series, No. 16 (H.M.S.O.), 1*s.*

AGRICULTURE.

B. G.

Age of Entry. 17+.

Qualifications.

1. For Farm Institute Course—none.
2. For Agricultural College Course—O.
3. For teaching and advisory service—Graduate.

Pay.

1. For Farm Managers £350+.
2. For Commercial Agricultural Representatives—about £300+ and commission.
3. For Technical Officers of Ministry—£545+.

Aptitudes. Genuine interest in the country and in farming. Ability to use one's hands.

Method of Entry. Normally one year on farm, followed by:—

1 year at Farm Institute, or
2 years at Agricultural College, or
3 years at University.

Further Study. Diploma Course (at Agritural College) or Degree Course (at University).

The young person who wishes to take up Agriculture as a career has normally to choose one of three ways of gaining the necessary knowledge and experience. Whichever way is chosen, it is highly advisable to spend a year on a farm gaining practical experience and making quite sure that this *is* the life one wishes to lead.

Then for those who are interested chiefly in the practical side and who do not wish to pursue theoretical studies too far, the best choice is the 1-year course at a Farm Institute. This will fit them to become a skilled farm worker or smallholder.

Those who intend to become farm managers or bailiffs do better to follow the 2-year course at an Agricultural College. These are both residential and non-residential, and the course leads to the National Diploma.

The last group are those who intend to become teachers or advisers in the service of the Ministry of Agriculture, Fisheries, and Food, or of County Councils. These are the ones who attend University and attain the B.Sc.(Agric.) degree.

There are, in addition to the three main methods of entry indicated above, the Agricultural Apprentice Scheme, and the "British Boys for British Farms" Scheme, which is sponsored by the Y.M.C.A. The Y.M.C.A. also arranges for boys to contact farmers for their year's practical experience.

The Apprenticeship lasts for three years. Apprentices are allotted to selected farms and, where necessary, arrangements are made for training to be carried on at more than one farm. The Y.M.C.A. scheme caters more for boys with a *town* background and has been operating successfully for more than 25 years.

For those wishing to do research a degree is almost essential.

Addresses.

The Agricultural Research Council, Cunard Buildings, Lower Regent Street, S.W.1.

Ministry of Agriculture, Fisheries and Food (Education Branch), Great Westminster House, Horseferry Road, S.W.1.

The Secretary, Y.M.C.A., "British Boys for British Farms," 4 Great Russell Street, W.C.1.

THE ARMED SERVICES.

All three Services today offer exceptional opportunities to those who enjoy community life, who wish to travel, and who have a sense of adventure. Space does not permit the giving of full details for each branch, and the following should be regarded as the barest of outlines only. Dealing first with entry through Non-Commissioned Ranks:

(*a*) **The Army.**

Men and Boys.

Age of Entry. 15–30.

Qualifications. Ability to pass selection test.

Pay. From 31*s.* 6*d.* per week (boy entrant) to £12–£16 per week (all found), depending on rank, service, and married status.

Aptitudes. In general, interest in outdoor life and sense of adventure.

Method of Entry.

1. Boys at 15+:—to Army Apprentice School.
2. Men:—Apply Army Recruiting Office.

Further Study. Great variety of courses available. Type and degree of specialisation largely dependent on individual's ability.

There are three Army Apprentice Schools—at Arborfield, Chepstow, and Harrogate, which give boys of school-leaving age thorough courses of technical training (including general education) lasting 3 years.

When these boys join the colours they stand an excellent chance of early promotion to Warrant

Officer or even commissioned rank. Their specialised training, which is developed and widened during their subsequent service, is also a very good preparation for skilled work in the civilian world when they are released.

Men under 30 (in exceptional cases 33) have similar opportunities during service of up to 22 years. Great emphasis is laid on sport and recreational facilities are available wherever the Army is, at next to no cost. The grim barrack blocks and needlessly restrictive regulations are becoming increasingly a thing of the past.

(*b*) **The R.A.F.**

Men and Boys.

Age of Entry. 15–40.

Qualifications. Selection and Aptitude tests to be passed.

Pay. 31*s*. 6*d*. per week (boy entrant) to about £16 per week (all found), depending on rank and married status.

Aptitudes. As for Army—perhaps greater need for potential skills.

Method of Entry.

1. Boys at 15+:—Aircraft Administrative Apprenticeship or Boy Entrant Training Scheme.
2. Men:—Apply R.A.F. Recruiting Office.

Further Study: Unlimited opportunities for those who are able, and want, to continue specialised training.

Boys who enter the Service on Aircraft and Administrative Apprenticeships or the Boy Entrant Training Scheme are trained according to ability and aptitude in a variety of trades covering all branches of R.A.F. activity. Examples are: aircraft engineering, radio, electrical, instrument and general engineering, telegraphist, photographer. They are thoroughly prepared for their subsequent career in the R.A.F., and have every chance of early promotion to Senior N.C.O. and even commissioned rank. There are three R.A.F. Apprentice Schools at Halton, Hereford, and Locking.

Men who enter from the age of 17½ receive a thorough training in one of the twenty-two trade groups, and here again there is every opportunity of promotion for those who show intelligence and initiative.

As with the Army, sport and recreational facilities are outstanding, and the airman can leave the service after 22 years with a pension and a thorough knowledge of a trade which he can turn to good account in civilian life.

(*c*) **Royal Navy.**

Men and Boys.

Age of Entry. 15–28.

Qualifications. Ability to pass Selection Test (Artificer Apprentice—O).

Pay. 31*s*. 6*d*. per week (boy entrant) to £12–£16 (all found), depending on rank, service, and married status.

Aptitudes. As for Army and R.A.F.

Method of Entry.

1. Boys:—
   (i) As Junior Entry.
   (ii) As Artificer Apprentice.
2. Men (17½+):—
   (i) Apply Naval Recruiting Office.
   (ii) Direct entry as Artificer—apply Naval Recruiting Office.

Further Study. Within the framework of the Service, the new entrant is encouraged to study to as high a standard as his capabilities allow.

Although all men and boy entrants into the Royal Navy receive wide and thorough training to suit them for their eventual jobs, there is one particular type of entry requiring higher initial qualifications and larger specialist training. This is for those who become Artificers. The boy entrant serves a trade apprenticeship for 4 years in the course of which he is chosen for one of the Technical Branches. Direct Entry as an Artificer (for men) is available for those who have done 4 years' civilian apprenticeship, and can pass a trade test, to become an Engine Room, Aircraft, Electrical Ordnance, or Shipwright Artificer.

As with the other Services, promotion prospects up to and including command rank are good for those with keenness and determination, and many of the specialist skills acquired during service are of great use in later civilian life.

General Note on Terms of Service.

It must not be forgotten that the Forces expect a fair amount of service in return for the very expensive training they provide, and the following is an indication of how each branch of the Services arranges its terms:—

1. **Army.** Apprentices undertake to serve until 26 years of age + 4 years in Royal Army Reserve. Service may be extended to 22 years, when there is a pension.
2. **R.A.F.** Apprentices undertake to serve until 30 years old (boy entrants until 28 years + 2 in Reserve). At any time after the age of 22 an airman may be re-engaged until he is 55, but he keeps the right to leave at 40 with a pension.
3. **Royal Navy.** All recruits except Artificer Apprentices have to serve 9 years (reckoned from the age of 18). Artificer Apprentices are required to serve 12 years (reckoned from the age of 18), as their training lasts so much longer.

Addresses from which detailed information about all three Services can be obtained:—

1. *Army.* The Under Secretary of State, War Office (M.P.6), S.W.1.
2. *R.A.F.* The Central Recruiting Office, Royal Air Force, Victory House, Kingsway, W.C.2.
3. *Royal Navy.* The Director of Naval Recruiting, Admiralty, S.W.1.

Pamphlets.

No. 50, *Her Majesty's Forces* (H.M.S.O.), 1*s*. 6*d*.

No. 55, *Army* (H.M.S.O.), 1*s*. 6*d*.

No. 56, *Royal Air Force* (H.M.S.O.), 1*s*. 3*d*.

No. 54, *Royal Navy* (H.M.S.O.), 1*s*. 6*d*.

Commissioned Service (All Arms).

B.

Age of Entry. 17–19.

Qualifications. Generally A, exceptionally O.

Pay.

1. *Army.* £383 p.a. + on commissioning as a 2nd/Lieut.
2. *R.A.F.* £456 p.a. + on commissioning as a P/Officer.
3. *Royal Navy.* £365 p.a. + on commissioning as a A/Sub/Lieut.

Given efficient service, promotion is automatic to ranks of Major, Wing Commander, and Lieut. Commander in the respective Services. Pay in these ranks is around £1,300 p.a. + considerable allowances, *e.g.*, Marriage Allowance, or flying Allowance.

Aptitudes. All three Services demand the highest standards of personality and integrity. Initiative, leadership, and self-reliance are essential qualities.

Method of Entry.

1. *Army*:—
   (i) To Welbeck College (the Army's 6th Form Public School); thence

to Sandhurst after good O level results in science and mathematics.
(ii) To Sandhurst direct.

2. *R.A.F.*:—
   (i) To R.A.F. College, Cranwell.
   (ii) To R.A.F. Technical College, Henlow.

3. *Royal Navy*:—
   (i) To Britannia Royal Naval College, Dartmouth.
   (ii) Suitably qualified candidates by interview for training and 12-year Commission in Fleet Air Arm.

Further Training. The Officer training of the Service concerned; then study for promotion examinations and a great variety of specialist courses throughout Service career.

Space does not allow the giving of detailed requirements and conditions of service. Broadly speaking, a candidate for a commission in any of the Armed Services must be of reasonable academic attainment (at least A level of the G.C.E.); must satisfy the Service Selection Board as to his suitability, and must be physically fit.

Permanent Commissions are available in the Army and the R.A.F., for graduates wishing to enter the Service. There is an ever-growing demand for entrants with scientific qualifications as the Services grow yearly more technical.

Short Service commissions for varying periods of years are also available in all three arms. They are non-pensionable, but carry a handsome gratuity at the end of the contract, and opportunities exist for converting these commissions into permanent commissions carrying the normal opportunities of advancement and pension entitlements.

No interested boy should be put off this career because of stories of the need for a private income. The vast majority of serving officers nowadays live successfully on their pay. Marriage, education, and disturbance allowances are generous, and make a great difference to the apparently modest basic scale.

Pamphlet.

No. 68, *H.M. Forces: Commissioned Service* (H.M.S.O.), 1*s*. 6*d*.

THE WOMEN'S SERVICES (The Women's Royal Army Corps, The Women's Royal Air Force, The Women's Royal Naval Service).

G.

Age. 17½+.

Qualifications. None laid down.

Pay. From £2 9*s*. per week on entry, all found.

Aptitudes. Liking for community life, willingness to travel, and ability to become proficient in a trade.

Further Study. In all cases, to acquire proficiency in a trade. In some cases, for promotion examinations.

The Women's Services are designed to relieve pressure on the available man-power, and there is, therefore, a variety of interesting careers within the framework of each Service. The following are examples of the main trades which can be studied and practised in each arm of the Services:—

W.R.A.C. Catering, Clerical work, Electrical work, Motor Transport, Signals, Storekeeping.

W.R.A.F. Aircraft Engineering, Radio work, Electrical work, Motor Transport, Air Traffic Control, General Engineering, Police, Radar Operating, Photography, Medical, Accounting, Supply.

W.R.N.S. Radio work, Air Mechanic, Radar, Telegraphist, Cinema Operator, Clerical, Supply, Catering, Medical.

Pay is at about three-quarters of the equivalent rating for men, and after 22 years' service women are entitled to a pension. At regular intervals they have the option of ending their Service, and can in any case withdraw on marriage if they wish.

Officers are recruited: (1) from the ranks, or (2) by direct entry.

Terms of service for officers are somewhat complicated, and vary from branch to branch, but in essence, an officer either serves for a period of 20 years to earn a pension or has a short-service commission, which usually carries a gratuity.

Addresses.

1. *W.R.A.C.* The Under Secretary of State, War Office (M.P.6), S.W.1.
2. *W.R.A.F.* The Central Recruiting Office, Royal Air Force, Victory House, Kingsway, W.C.2.
3. *W.R.N.S.* The Director, W.R.N.S., Queen Anne's Mansions, S.W.1.

Pamphlet.

No. 63, *H.M. Forces: Women's Services* (H.M.S.O.), 1*s*. 9*d*.

AUCTIONEERING OR ESTATE AGENCY.

B.

Age of Entry. 16–18.

Qualifications. O.

Pay. £500–£600 (on qualification as Junior Assistant).

Aptitudes. Ability to make clear judgments and master complicated detail.

Method of Entry.
1. As Junior Clerk.
2. As Articled pupil.
3. As Graduate in Estate Management.

Further Study. Part-time study for professional qualification.

There are two main branches of this profession, namely the urban and the rural. This is recognised in the examinations of the professional bodies, and the candidate is able to study in accordance with his own inclinations and background. Thus the young countryman will probably feel more at home studying Agricultural Science, and Husbandry and Farm Management, rather than Dilapidations and Fixtures and Domestic Sanitation.

This glimpse of a section of the candidate's studies may serve to dispel the idea that all a qualified Auctioneer and Estate Agent has to do is to earn money through exercising a big voice and a small hammer.

Indeed, through a combination of training, study, and experience, he has to become an expert in such matters as the money market, valuations, mortgages, construction and maintenance of buildings, and have more than a nodding acquaintance with the Law of Property and the Law of Contract.

The three ways into the profession are:

1. By service as a Junior Clerk combined with part-time study.
2. By taking articles, which may cost over £200 for the premium. This is a more satisfactory way than (1) above, and arrangements can often be made to pay the premium by instalments, or even to have it waived altogether.
3. By entry with a degree, which must be either the B.Sc. (Estate Management) of the University of London or the B.A. (Estate Management) of the University of Cambridge. Both these degrees provide exemption from the professional examinations.

There are no laid-down salary scales for the profession at present, but a qualified successful

man could expect to earn up to about £1,500 p.a. as Manager. There are also some openings in the Civil Service for suitably qualified people.

Addresses of Professional Bodies.

The Chartered Auctioneers' and Estate Agents' Institute, 29 Lincoln's Inn Fields, W.C.2.

The Incorporated Society of Auctioneers and Landed Property Agents, 34 Queen's Gate, S.W.7.

Pamphlet.

Careers for Men and Women, No. 6 (H.M.S.O.), 9*d.*

BANKING.

B. G.

Age of Entry. 16–18.

Qualifications. O (or ability to pass Entrance Exam).

Pay. £270–£900.

Aptitudes. Integrity and ability to mix.

Methods of Entry. By application to local or Staff Manager of Bank concerned.

Further Study. For Diploma Examinations of Institute of Bankers (either Banking Diploma or Trustee Diploma).

Nowadays there are many opportunities in the world of banking for the keen boy or girl who is prepared to study and take a real interest in the job. Although the starting salary is modest, some idea of the prospects may be gained from the fact that out of every three young men joining a bank one can expect to become a Manager or executive of similar status. The pre-war regulation whereby girls had to resign on marriage has now been largely withdrawn, and a keen, intelligent girl has good prospects of earning more than £1,000 p.a. The widespread belief that the promotion—if it comes at all—comes only late in a career is without foundation today, and in most banks those who are going to go ahead are noted for promotion within the first 10–12 years.

Banks are well known as good employers. Encouragement (often financial) is given to continuing study, pensions are usually two-thirds of the eventual salary, and often non-contributory. Assistance with house purchase is normally obtainable at rates which are far better than the man in the street can obtain from other sources. Girls who do leave on marriage can expect a "dowry" if they have completed a reasonable term of service.

Addresses of Professional Bodies.

The Institute of Bankers, 10 Lombard Street, E.C.3.

Institute of Bankers in Scotland, 62 George Street, Edinburgh.

Pamphlets.

Choice of Careers Series, No. 67 (H.M.S.O.), 1*s.*

BEAUTY CULTURE.

G.

Age. Possible at 16+, but reputable firms usually wait till 24.

Qualifications. —

Pay. £7–£8 after 2 years. (There are no fixed rates.)

Aptitudes. Ability to get on with women, tact, self-confidence, and good manner of speaking.

Method of Entry. Acceptance by private training organisation.

Further Study. 3–12 months' training.

The usual way of acquiring training is to attend a privately run school, fees for which vary, but which for a year's course are in the neighbourhood of £120 p.a. Local Authorities rarely give grants for training. The courses, which are theoretical as well as practical, lead to a diploma issued by the School, and this is, of course, useful in obtaining a post. For those who wish to run their own salons, there are often side courses in such things as Salesmanship, Display, and Management. Many firms expect candidates to have done a preliminary course in Hairdressing (*see* E22 (2)) first.

It must be emphasised that this is a tiring and often frustrating job, and the successful girls are the ones who can stand for long hours without showing strain, and who can keep even-tempered even when there is a long run of ill-mannered or inconsiderate clients.

Addresses.

Barrett St. Technical College, Oxford Street, W.1.

The Delia Collins School of Beauty Culture, 40 Sloane Street, Knightsbridge, S.W.1.

The Academy of Beauty Culture Ltd., 72 Park Mansions, Knightsbridge, S.W.1.

The Mary Wood Training School of Beauty Culture and Salesmanship, 42 Beauchamp Place, S.W.5.

The Mary Reid School of Beauty Culture, 8 Queen Street, Edinburgh.

CATERING AND HOTEL MANAGEMENT.

B. G.

Age. 15+. 16+ for Hotel Management Course.

Qualifications. Preferably O.

Pay. £400+.

Aptitudes. Interest in making other people happy and comfortable; practical efficiency; interest in food and drink extending beyond greediness.

Method of Entry. As student in Technical College which runs a Hotel and Catering Course. (Addresses of these from Hotel and Catering Institute, or from Careers Pamphlet No. 33.)

Further Training. One to four years' part- or full-time study in a Technical College leading to Diploma or Certificate.

Individual Colleges (*e.g.*, Battersea College of Technology and Westminster Technical College) give their own awards on satisfactory completion of their own courses; to an increasing extent Local Authority Technical Colleges are running courses in Hotel Work, including cookery, and students are prepared for the City and Guilds Institute Certificates. Courses vary in length, and often the training course includes practical experience in a hotel or restaurant; sometimes up to one year will be spent abroad. Jobs in hotels, either as chefs or as assistant managers are readily available to those who are well qualified; the pay is good and the prospects encouraging, but hotel work of all kinds is inevitably wearing, both physically and mentally, and good health and even temper are important pre-requisites.

Addresses.

Battersea College of Technology, S.W.1.

Westminster Technical College, Vincent Square, S.W.1.

Hotel and Catering Institute, 24 Portman Square, W.1.

Pamphlet.

Choice of Careers Series, No. 33 (H.M.S.O.)

CHILD CARE.

B. G.

Age. 21. Graduate or comparable qualification.

Pay. About £575 rising to about £750.

Aptitudes. Interest in and sympathy for children, ability to get on with people and create confidence.

Method of Entry. Selection by Central Training Council in Child Care.

Further Study. 1 year's University Course including practical vacation work.

The Child Care Officer works for a Local Authority or a voluntary organisation concerned with the welfare of children. He (or more usually she) is concerned with arranging the care of children who are not able to enjoy normal home life.

The following are some of the duties:—

1. Investigation of cases where children need to to be taken into the care of the Local Authority.
2. The finding of suitable foster parents and subsequent supervision of the foster-children's welfare.
3. Work to keep families together wherever possible, and to bring them together where they have been broken.
4. Representation of Local Authority or voluntary organisation in Court.
5. Arrangements for adoption.

The work is of absorbing human interest and, as so often in the case of the social services, the financial rewards are comparatively low. For those who rate service to others higher than personal reward, it provides, however, work of great responsibility which has its own satisfaction and for which there is a constant and growing need.

Address.

The Central Council in Child Care, Home Office, Horseferry House, Thorney Street, S.W.1.

CHIROPODY.

B. G.

Age. 17+.

Qualifications. O.

Pay. When qualified £435–£700 p.a. (approx.) (in public service).

Aptitudes. Interest in people, good eyesight, reassuring personality.

Method of Entry. Acceptance by School recognised by Board of Registration of Medical Auxiliaries.

Further Study. 3 years' full-time course leading to Final Professional Examination.

Chiropody—care of the feet—is becoming increasingly important nowadays. This is borne out by the growing number of posts available in public service (hospitals and clinics) and large firms. Probably the majority of qualified people still prefer, however, to go into private practice. When a practice is well established it can provide a very reasonable living, but there is always the difficult period when the new practitioner is getting himself known, and the beginner must be prepared for lean times at first.

Private practice is attractive partly because one can equip oneself for the job for little more than £100.

Address.

The Society of Chiropodists, 8 Wimpole Street, W.1.

Pamphlet.

Choice of Careers Series, No. 61 (H.M.S.O.), 6*d.*

THE CHURCHES.

B.

The Ministry or priesthood can hardly be considered a career in the same sense as most of the jobs in this section. Financial reward is limited, and the boy who wishes to become a minister must be prepared for a lifetime of service to others and be convinced of his own vocation. This applies to all the churches, and the first thing for any boy to do is to consult the minister of the church he attends. The following is intended, then, as an outline only of the procedure where four of the main churches are concerned. No reference has been made to salary or "promotion" prospects.

(*a*) **Church of England.**

Age. Normally 20.

Qualifications. Up to 25 years old, normally a Degree. After 25—A may suffice.

Method of Entry. Application through minister to Central Advisory Council of Training for the Ministry.

Further Study. Normally a full-time University Degree followed by 2 years at a Theological College. Modified arrangements are made for the training of those who wish to enter the Ministry later in life.

Address. The General Secretary, Central Advisory Council of Training for the Ministry, Church House, Westminster, S.W.1.

(*b*) **Roman Catholic Church.**

Age. Candidates for ordination must notify their intention from age of 13+.

Qualifications. Usually O or A before acceptance into Seminary.

Method of Entry. Via Parish Priest.

Further Study. 6 years or longer in a seminary at home or abroad.

(*c*) **The Methodist Church.**

Age. Preferably before 30.

Qualifications. Passing the Local Preacher's written examinations.

Method of Entry. Via the Superintendent Minister of the circuit in which he is a church member.

Further Study. 3 or 4 years at one of six Residential Colleges affiliated to a University Course, probably including a degree.

Address. The General Secretary, Ministerial Training Committee, 1 Central Buildings, Westminster, S.W.1.

(*d*) **The Baptist Church.**

Age. Under 40.

Qualifications. Usually O.

Method of Entry. Via the Association to which candidate's Church belongs.

Further Study.

1. 3 to 6 years at a Baptist College including perhaps a degree course at University to which College is affiliated.
2. Examinations prescribed by Baptist Union.

Address. The Baptist Union of Great Britain and Ireland, The Baptist Church House, 4 Southampton Row, W.C.1.

THE CIVIL SERVICE.

B. G.

There are three main classes of the Civil Service, which are dealt with separately below. The openings in the Foreign and in the Scientific Civil Service are listed at the end of this section.

(*a*) **The Clerical Class.**

Age. 16–20.

Qualifications. At least O or appropriate Civil Service examination.

Pay. £282–£789 p.a.

Aptitudes. Various, according to department involved, but in all cases a liking for general office duties.

Method of Entry.

1. By Clerical Class Examination.
2. By interview if holding O.

The Clerical Class makes up the largest group of Civil Servants, and the work varies according to the department concerned. Thus the Clerical Officer may have to compile statistics, prepare documents, check accounts, or to interview members of the public and deal with correspondence. Newcomers to departments are systematically trained in the work they will be doing.

Opportunities exist within the Service for promotion to the Executive Class, either by internal examination or, in the case of Civil Servants over the age of 28, on merit. Pensions are non-contributory (except in so far as dependents are concerned). There is usually a five-day week and holidays are generous. Juniors are often assisted with lunch vouchers, and even lodging allowances. Welfare and security of tenure are excellent.

(*b*) **The Executive Class.**

Age. 17½–24.

Qualifications. A or appropriate Civil Service Examination.

Pay. £447–£1,140 (basic grade).

Aptitudes. Sound judgment, initiative, sense of responsibility.

Method of Entry.

1. By Executive Class Examination.
2. By interview if holding A.

The work of the Executive Officer might be summed up as the detailed carrying out of policy that has been decided, and thus can carry a considerable amount of responsibility. As with the Clerical Class, training is given to new entrants to fit them for their duties, and some officers are chosen for specialist training in such fields as accountancy or statistics. Those who show great ability have opportunities of promotion to the Administrative Class, and many more reach the grades of Higher Executive Officer, Senior Executive Officer, and Chief Executive Officer, with correspondingly bigger salaries.

(*c*) **The Administrative Class.**

Age. 20½–24.

Qualifications. Normally a good degree, and/or appropriate Civil Service examination.

Pay. £655–£2,120 p.a.

Aptitudes. Creative approach, judgment of highest order, capacity for involved and protracted original work.

Method of Entry.

1. Administrative Class Examination and interviews.
2. 1st and 2nd Class Honours Degree followed by tests and interviews.

The Senior Civil Servants in this Class are the people responsible for formulation of national policy in accordance with the wishes of the Ministers. These posts are among the hardest to obtain, and any boy or girl going to University with the intention of becoming an Administrative Class Civil Servant should not be disappointed if the goal is not reached.

The work involves giving expert advice to Ministers of the Crown, planning new proposals, giving flesh and blood to the wishes of Parliament, and the organising of departmental work. For the very best are the rewards of a Permanent Under-Secretaryship, and the attendant heavy responsibilities.

The foregoing is an indication of the structure and possibilities of the three main classes of the Civil Service. There are in addition many ancillary and specialist departments which offer attractive careers, such as the following:—

1. (Parallel to Clerical Branch): Assistant Preventive Officers, Cartographical Draughtsmen, Assistants in Scientific Civil Service, Foreign Service (Grade 6, Branch B).
2. (Parallel to Executive Branch): Officers of Customs and Excise, Assistant Experimental Officers in the Scientific Civil Service, Foreign Service (Grade 5, Branch B).
3. (Parallel to Administrative): Statisticians, Patent Examiners, Inspectors of Taxes, Inspectors of Factories, Scientific Officers, engineering posts, Foreign Service (Senior Branch).

Address.

The Secretary, Civil Service Commission, 6 Burlington Gardens, W.1.

Pamphlets.

Choice of Careers Series

No. 31, *Civil Service Junior Posts* (H.M.S.O.).

No. 32, *The Civil Service, General, Scientific and Technical Posts* (H.M.S.O.).

DANCING.

B. G.

Age. 9–15 (for entry to a Ballet School). Otherwise not after age of 17.

Qualifications. —

Pay.

1. Corps de Ballet, £10 11*s*. per week.
2. Revue Chorus work, £11 13*s*. per week. (These are London rates. Television work, solo work, etc., may earn considerably more).

Aptitudes. Natural ability essential; determination; extremely good health.

Method of Entry. Acceptance by a School of dancing. Royal School of Ballet offers Scholarships for boys.

Further Training.

1. Ballet Schools: Dancing instruction combined with general education.
2. Other Schools of Dancing: 3–5 years leading to examinations of Royal Academy of Dancing and Imperial Society of Teachers of Dancing.
3. 3-year training course (for intending teachers), *e.g.*, at Royal Academy of Dancing.

There are two main divisions of dancing as a profession—theatrical and teaching. On the theatrical side many young people (girls especially) are attracted nowadays to ballet, and it must be emphasised that only those in the very highest flight can hope to win a position in a corps de ballet. It is worth noting that the Royal Ballet School itself provides 85 per cent of the ballet companies of the Royal Opera House and Sadler's Wells. There is a shortage of good male dancers, so prospects for boys are better than for girls.

Apart from ballet, revue work and television (increasingly) provide employment for those who are set on making dancing a career. Minimum pay is fixed by Actors' Equity. It is quite common for dancers to take up teaching when they retire from the stage. The teaching may be in private establishments, where the remuneration is by arrangement, or in State schools, where salary is in accordance with the terms of the Burnham Committee Report. Others prefer to go for teaching from the outset, and the Royal Academy of Dancing runs 3-year training courses.

While there are various scholarships available from the different schools, the fees are often quite stiff (for example, the Royal Ballet School fees are £153 p.a. for day pupils and £350 for boarders). Help may often be obtained, however, from the

local Education Authorities, subject to means of parents.

Addresses.

The Royal Ballet School, 45 Colet Gardens, W.14.

The Royal Academy of Dancing, 15 Holland Park Gardens, W. 14.

Book.

The Making of a Dancer, by Arnold Haskel (Pub. A. C. Black), 8*s.* 6*d.*

DENTISTRY.

B. G.

Age. 17.

Qualifications. A.

Pay.

1. In Public Service, £1,100–£1,750+.
2. In private practice—dependent on size of practice, but usually well over £1,000 p.a.

Aptitudes. Calmness of manner, ability to instil confidence, manual dexterity.

Method of Entry. By application to approved Dental School.

Further Study.

1. A Degree course.
2. Diploma Course at dental school.

There is a great need nowadays for trained dentists of both sexes, both in private practice and public service. The course of training is long (4½ years for those holding qualifications on entry as above in chemistry, physics, and biology, which enables them to gain exemption from Part I of the training course). It is also expensive for those who cannot get substantial assistance from Local Education Authorities or other sources (£400–£500 in addition to books and living expenses). But for those who are willing to make the initial sacrifices it offers an interesting and valuable career which, for once, is well rewarded, but the work is very demanding.

One word of warning. There is considerable competition for entry, and only very good candidates are accepted.

There are Dental Schools in, or attached to, the following Universities: St. Andrews, Queen's (Belfast), Birmingham, Bristol, Durham, Leeds, Manchester, and Sheffield. Teaching hospitals and schools are: The Edinburgh Dental Hospital and School, The School of Dental Surgery (Liverpool), Guy's Hospital Dental School, The Glasgow Dental Hospital and School, King's College Hospital Medical School, The London Hospital Dental School, The Turner Dental School and Dental Hospital (Manchester), The Royal Dental Hospital (London), and University College Hospital Medical School.

Address.

The General Dental Council, 44 Hallam Street, W.1.

Pamphlet.

Dentistry—A career and a future. Available from General Dental Council.

Choice of Careers Series, No. 96 (H.M.S.O.), 9*d.*

DENTAL NURSE.

G.

Age. 15–17.

Qualifications. None laid down.

Pay. £220–£595.

Aptitudes. Neatness and pleasant, reassuring personality.

Method of Entry.

1. By application to Dental Hospital for course.
2. By application to a dentist in private practice.

Further Training.

1. Full-time course (6 months–2 years, depending on Hospital).
2. By dentist in private practice during course of work.

The Dental Nurse (or Dental Surgery Assistant, to give her her correct title) has to be a girl who can adapt herself to a variety of jobs connected with dentistry. She may be expected to look after the clerical and reception work of a practice, reassure patients before treatment (and comfort them afterwards), process X-ray photographs, and prepare materials for use by the dentist. In a hospital with a Dental Department her work will naturally tend to be more specialized.

Full-time training can be had at the following institutions:—

Guy's Hospital Dental School, S.E.1.

Eastman Dental Hospital, Gray's Inn Road, W.C.1.

London Hospital, Whitechapel, E.1.

In the provinces at the Dental Hospitals of Bristol, Birmingham, Dundee, Manchester, Sheffield.

The details of these courses vary considerably from hospital to hospital, but in all cases, however, the students work for the Examination for Dental Nurses and Assistants, which is held annually in London.

The pay is not startlingly good, but for the girl who enjoys giving service to others and meeting different types of people Dental Nursing offers a satisfying and interesting career.

Address.

The British Dental Nurses and Assistants Society, 2 Summer Street, Leyland, Lancs.

Pamphlet.

Dental Surgery Assistants. Available from the British Dental Nurses and Assistants Society.

DENTAL TECHNICIAN.

B. G.

Age. Under 16.

Qualifications. —

Pay. £8 10*s.* to £10 2*s.* 6*d.* per week basic.

Aptitudes. Ability with hands and liking for delicate manual work.

Method of Entry. Acceptance by dentist, hospital, or firm, as apprentice.

Further Training. 5-year apprenticeship including 1 day part-time-release study per week.

The Dental Technician is the craftsman (or woman) who makes the various appliances used nowadays, such as dentures, bridges, and plates. There is one peculiarity about this career which is worth noting—namely, that a boy or girl cannot be accepted *after* the age of 16 as an apprentice. Apprenticeships are available with private dentists, hospitals and firms manufacturing the various appliances and, together with the practical experience they gain, apprentices have to prepare themselves for the Intermediate and Final examinations of the City and Guilds of London Institute, which are both practical and theoretical in their scope.

There is a constant demand for the services of Dental Technicians, and no skilled person need fear unemployment, but there may be difficulty in getting taken on as an apprentice.

Address.

Associated Dental Technicians Section of the Society of Goldsmiths, Jewellers, and Kindred Trades, 329–331 Gray's Inn Road, W.C.1.

DIETETICS.

B. G.

Age. 20–21.

Qualifications. One of the following:—

1. Degree in Household Science, Nutrition, Domestic Science, or Pure Science, plus at least 3 months' training in cookery.
2. State Registration in Nursing, plus at least 3 months' training in cookery.
3. Teacher's Diploma in Domestic Science, with perhaps additional qualifications in physiology and chemistry.
4. Institutional Management Certificate plus approved educational exam.
5. Associate Membership of Hotel and Catering Institute resulting from examination, plus approved 2-year course in catering.

Pay. About £465–£700 p.a. (in some cases to over £1,000).

Aptitudes. Interest in people, organising ability, ability to think clearly.

Method of Entry. Acceptance by one of the bodies running courses leading to one of the recognised Diplomas in Dietetics (see below).

Further Training. Usually 12–18 months full-time theoretical and practical study.

The dietician is concerned with the study of nutrition—the composition of food and how the body uses it. A lot of the work is in hospitals, where the dietician is of great value in the treatment of illness, and training therefore includes a period in a hospital kitchen (hence the need to be able to cook). In the course of the job the dietician meets all sorts and conditions of people, from doctors and food specialists to refractory patients, and so must be prepared to exercise tact and discretion and to mix easily.

The following hospitals are recognised for the training of Dieticians:—

Belfast:	Royal Victoria Hospital.
Birmingham:	Queen Elizabeth Hospital.
Cambridge:	Addenbrooke's Hospital.
Dublin:	St. Vincent's Hospital.
Edinburgh:	The Royal Infirmary.
Glasgow:	The Western Infirmary.
Leeds:	The General Infirmary.
London:	The London Hospital. The Middlesex Hospital. St. Thomas's Hospital. University College Hospital.

Address.

The British Dietetic Association, 251 Brompton Road, S.W.3.

Pamphlet.

Choice of Careers Series, No. 13 (H.M.S.O.), 1*s.*

DOMESTIC SCIENCE.

G.

Age. 16–18.

Qualifications.

1. For Institutional Management Association Course, O.
2. For Teachers Training College, O or A.
3. For University Course, A.

Pay.

1. Domestic Management, £6 per week (non-resident)—£750+ p.a. all found, depending on qualifications and type of post.
2. Teaching—Burnham Scales (see Teaching).

Aptitudes. Interest in people, sense of craftsmanship, organising ability, ability to get on with people.

Method of Entry. Acceptance by technical college, training college, or University for the appropriate course.

Domestic Science training is, of course, of great value to all girls at all times. In few other jobs can a girl feel that her training and experience are going to be of such obvious use to her when she leaves her work to get married and bring up a family.

Training falls into two main categories: (i) for Teachers; (ii) for those going into institutional, catering, and matron/housekeeper posts. Girls who wish to teach will seek acceptance at either a Training College or University which offers a course in Domestic Science (at the moment there are two—London (Queen Elizabeth College) and Bristol). For general remarks on Teaching as a career, see under the appropriate section.

Those who are most interested in the second category have a great variety of jobs open to them, depending on their skill and qualifications, jobs which range from junior ones in catering and domestic management to responsible posts in industrial organisations, colleges, and hospitals. Especially interesting for those wishing to combine Domestic Science with service to others and community life are the courses run by the Industrial Management Association for the Matron-Housekeepers Certificate. Girls are prepared to work as Matron-Housekeepers in communities of fifty to sixty children where the organisation is as home-like as possible.

Address.

The Institutional Management Association, Swinton House, Gray's Inn Road, W.C.1.

The Ministry of Education, Curzon Street, W.1. (For details of Teacher Training College Courses.)

Pamphlet.

Choice of Careers Series, No. 13 (H.M.S.O.), 1*s.*

DRAMATIC ART.

B. G.

Age. Normally 17–18 (18 for a teaching course).

Qualifications. Preferably O or A.

Pay.

1. £10–£12 per week minimum (in London).
2. As teacher—in accordance with Burnham scales.

Aptitudes. Acting ability, determination, good health.

Method of Entry. Usually acceptance by a school of drama.

Further Training. 2–3 years' full-time course at a school of drama.

The first thing to say about acting as a career is that it is a very insecure profession, offering great rewards to the few, but very often frustration and disappointment to the majority—especially to girls. At any one time up to half the qualified actors and actresses are unable to get work in the theatre.

For those who are nevertheless determined to make a career of the stage, by far the best way of getting training is to obtain a place at one of the schools of drama; the addresses of some of these are given below.

On completion of the course, the next step is to obtain a situation with a Repertory Company, if possible, and so enlarge the field of experience. Some lucky ones, of course, get recognition and "stardom" while training or even before, but this is very much the exception to the rule.

Some of the schools of drama mentioned above run courses for teachers of dramatic art. These courses are recognised as a teacher's qualification by the Ministry of Education, and on this side the prospects are much brighter, as there is a growing demand in educational establishments of all descriptions for dramatic work in and out of the classroom.

Addresses.

The British Actors' Equity Association, 8 Harley Street, W.1.

The Royal Academy of Dramatic Art, 62–4 Gower Street, W.C.1.

The Central School of Speech and Drama, The Embassy Theatre, Swiss Cottage, N.W.3.

The Guildhall School of Music and Drama, John Carpenter Street, Victoria Embankment, E.C.4.

The Rose Bruford Training College of Speech and Drama, Lamorbey Park, Sidcup, Kent.

Pamphlet.

Choice of Careers Series, No. 97 (H.M.S.O.), 1*s.*

DRAUGHTSMAN.

B.

Age. 15½–18.

Qualifications. Preferably O or first year of O.N.C.

Pay. About £9 (at age 21)—£14+ (at age 25).

Aptitudes. Capacity for attention to detail, sound maths., ability to think for himself.

Method of Entry. Apprenticeship with a firm.

Further Training. 5-year apprenticeship including day release study at a technical college leading to technical or professional examinations.

It is a common mistake to think that all a draughtsman needs to have in the way of natural talent is the ability to draw well. His job is the preparation of scale drawings from which the various parts of, for instance, a machine are made. He therefore needs to know enough engineering to be sure that the parts he is drawing will do their job and enough mathematics to calculate stresses by formula. Most firms insist that their apprentices should have a thorough grounding in general engineering practice in various departments before the real drawing-office training begins. The apprenticeship, including part-time theoretical study, usually leads to examinations such as the Ordinary and Higher National Certificate and those of the Institution of Engineering Designers, the Institution of Mechanical Engineers, the Institution of Electrical Engineers among others.

The work of a draughtsman is very satisfying for those who are interested in drawing and engineering, and it has very often proved a valuable stepping-stone to senior technical appointments in industry.

Address.

The Institution of Engineering Designers, 38 Portland Place, W.1.

DRESS DESIGNING.

Usually G.

Age. Usually 15½–18.

Qualifications. None laid down.

Pay. No scale: salary by arrangement.

Aptitudes. Practical needlework, perseverance, knowledge of and interest in French and Art.

Method of Entry.

1. Learning while working in factory or workroom.
2. Acceptance by Technical College or School of Art for full-time course.

Further Training.

1. Training in factory or work-room supplemented by part-time technical or art college study (about 4 years).
2. Full-time course in technical or art college (2–4 years).

Dress Designing is not a well-defined career in the sense that so many in this section are. Obviously all dresses have to be designed before they are made, but there are 3 fairly distinct classes of work:—

1. "Haute Couture"—the designing of models for the famous fashion houses. This is a "glamorous" job, and only very few really outstanding people achieve posts of this nature. Even for these, there is a great element of chance in the process of becoming recognised.
2. "Wholesale Couture"—the designing of models for restricted retail trade, usually based on the current fashion trends.
3. "Wholesale Manufacture"—the designing of cheaper dresses for production in large quantities.

There is no guarantee of employment for those who have successfully completed their training, and a great deal of luck is needed (being, for example, in the right place at the right time).

Mention must be made of an alternative method of training at the Faculty of Dress Design of the Royal College of Art. Candidates for the 3-year full-time course have to be between the ages of 17 and 25, and have to pass an entrance examination in five Parts. Part I is the submission of "testimonies of study" (*i.e.*, examples of candidate's original work), and Part II is a more general examination testing the candidate's interests, command of English, and critical approach to contemporary trends in fashion. There is also a practical test.

For those who are accepted, the 3-year course includes Life Drawing, History of Costume, Designing, Dressmaking, Tailoring, Millinery, Accessories, Pattern Cutting, Children's Clothing, Lingerie, Shoe Design, and Jersey Wear. Successful graduates are entitled to style themselves Designer of the Royal College of Art (Des.R.C.A.).

There is also a course of training at the Barrett Street Technical College, Oxford Street, which is very suitable for those interested in wholesale designing.

Address.

The Faculty of Fashion Design, The Royal College of Art, 20 Ennismore Gardens, S.W.7.

Pamphlets.

Choice of Careers Series:—

No. 9, *Dressmaking and Millinery* (H.M.S.O.), 1*s.* 3*d.*

No. 10, *Dress Designer* (H.M.S.O.), 6*d.*

ENGINEERING (GENERAL).

B. G.

Space does not allow full treatment of this extremely complex career in all its aspects. The following should therefore be regarded as the barest outline of the main branches of the profession and, before any decision is reached, advice and full details should be obtained from the Youth Employment Officer and professional bodies concerned. These are *examples* only of engineering careers available and, it is hoped, will serve to indicate the general pattern. *See* Charts (E5, 6).

Age. 15 (as an apprentice) and upwards, dependent on method of entry.

Qualifications. Dependent on method of training and branch concerned; most common are O.N.C. and (if possible) followed by H.N.C.

Pay. From 54*s.* per week (starting apprentice aged 16)—about £600–£800 p.a. on completion of apprenticeship. Thereafter depending on branch of profession, but in region of £1,000 p.a. at age 30. Further prospects depending on quality of individual.

Aptitudes. All branches demand character and intellectual ability from those who are

going to do well. All would-be engineers must possess qualities of patience and assiduity, and be interested as well in the special requirements of their particular field.

Method of Entry. Usually—1. Apprenticeship; 2. Sandwich Course; 3. As a graduate.

Further Training.

1. *Apprenticeship.* Usually 5 years supplemented by part-time study at technical college, leading to examination of professional body concerned.
2. *Sandwich Course.* Usually 4-year course leading to (for example) Diploma in Technology. The course is usually alternate six-monthly periods of full-time study at a technical college (or CAT) and full-time engineering practice with a firm.
3. *As a Graduate.* A further period of "graduate apprenticeship" (about 2 years) is usually required. One of these years may sometimes be served *before* beginning the graduate course.

1. Aeronautical Engineering.

This covers a very wide field and includes design and construction of engines, airframes, guided weapons, and secondary equipment.

(a) *Trade Apprenticeship* (5 years) leads to jobs of Fitter, Machinist, Tool-maker, Sheet-metal Worker, Electrician, Pattern-maker. There are good opportunities for further promotion.
(b) *Engineering Apprenticeship* (for those holding O or A or equivalent) leading to posts in Design, Stressing, Aerodynamics, Laboratory, or Maintenance. Promotion prospects to executive level are excellent.
(c) *Student Apprenticeship* (for graduates) leading to senior technological positions.

Address.

The Royal Aeronautical Society, 4 Hamilton Place, S.W.1.

2. Automobile Engineering.

A specialised branch of mechanical engineering, sub-divided into Chassis Engineering and Body Engineering.

(a) *Trade Apprenticeship* (4–5 years) leads to skilled craftsman status in one of the following trades: Body Engineering, Body Jig-making, Carpentry, Electrical Maintenance, Fitting and Turning, Foundry Work, Machine Tool Fitting, Laboratory Work, Pattern-making, Press-tool Making, Sheet-metal Work, Tool-making, Welding.
(b) *Engineering Apprenticeship* (for those holding O or A or equivalent). These apprenticeships lead to posts in the following departments: (1) Development, Experimental, or Research; (2) Drawing Office; (3) Production; (4) Costing; (5) Service (Technical); (6) Sales.

Address.

The Institution of Mechanical Engineers, (Automobile Division), 1 Bird Cage Walk, S.W.1.

3. Chemical Engineering.

The chemical engineer's main job is the design, construction, and operation of equipment in connection with manufacturing processes where there are chemical (and sometimes physical) changes.

(a) *Student Apprenticeship* with a suitable firm, combined with part-time study for O.N.C. and H.N.C. is a common method of entry for those who do not take a degree. Regional Gas Boards offer interesting openings in Chemical Engineering.

Alternatively:

(b) *Sandwich Course* at a Technical College or CAT, leading to Diploma in Chemical Engineering.

The two other main methods are:—

(c) *Degree Course* in Chemistry, followed by post-graduate course in Chemical Engineering.
(d) *Degree Course* in Chemical Engineering.

Universities offering Chemical Engineering Degrees are: Birmingham, Cambridge, Durham, Edinburgh, Glasgow, Leeds, London, Manchester, Sheffield, and Wales.

Technical Colleges or CATS offering Diploma Courses in Chemical Engineering are at: Birmingham, Glamorgan, Glasgow, London, Loughborough, Manchester, Neath, and Salford.

Address.

The Institution of Chemical Engineers, 16 Belgrave Square, S.W.1.

4. Civil Engineering.

The term covers the design, construction, and maintenance of railways, roads, waterways, bridges, dams, tunnels, airports, etc. Municipal Engineering is the field of Civil Engineering concerned with municipal services, such as public health, town planning, water supply, drainage, and surveying work.

(a) *Apprenticeship* is open to those with O (or who can pass the Common Preliminary Examination of the Engineering Joint Board); 3 years' practical and theoretical work, supplemented by part-time technical work to H.N.C. or a degree in engineering; 2 years' further practical experience is needed before qualifying for Associate Membership of the Institution of Civil Engineers.
(b) *Degree Course/Diploma in Civil Engineering Course.* These are available through Student Apprenticeships (*see* E7 (1)) or through full-time study at a CAT or University. Entrance qualification A level. The courses are followed by 3 years' work (usually as a graduate assistant to an approved firm of civil engineers) before full status is gained.

Address.

The Institution of Civil Engineers, Great George Street, S.W.1.

5. Electrical Engineering.

This is a "blanket" term covering a very wide range of occupations, ranging from fundamental research and design to routine maintenance of installations.

(a) *Craft Apprentices* usually enter a works on leaving school. Those who show ability are encouraged to continue part-time studies leading to the City and Guilds of London Institute Electrician's Certificate.
(b) *Electrical Technicians* follow a course of practical training supplemented by part-time study at a Technical College, or in some cases they follow a course based on the "block-release" system (*i.e.*, 4 weeks' full-time study alternating with approximately double the period work with the firm). The great variety of courses available and specialised training involved cannot be dealt with here, but mention may be made of the City and Guilds of London Institute Electrical Technician's Certificate, towards which the training of many technicians leads.
(c) *Professional Electrical Engineers* are trained either by following a full-time degree course at a University (or a full-time diploma course at a technical college or CAT), or by taking a Student Apprenticeship which involves a Sandwich Course and leads usually to H.N.C. after 4–5 years. In both cases further study and examinations are necessary before Associate Membership of the Institution of Electrical Engineers is obtained.

Address.

The Institution of Electrical Engineers, Savoy Place, W.C.2.

6. Mechanical Engineering.

Mechanical Engineering is concerned with the design, manufacture, and maintenance of machinery. There is a tremendous variety of work which comes within the scope of the Mechanical Engineer, and many of the other branches which are mentioned in this section need a good general grounding in mechanical engineering as a prerequisite of further training.

(a) *Trade Apprenticeship.* This is for youngsters leaving school who wish to make a career as skilled craftsmen. The apprenticeship lasts 5 years, and practical experience is supplemented by day part-time-release courses, evening courses, and, in some cases, Sandwich Courses. Apprentices prepare for City and Guilds or O.N.C. and H.N.C. and even higher qualifications. Those who do not follow their studies to this level are thoroughly trained as skilled workers in trades such as Milling, Turning, Fitting, Setting, Grinding, Foundry Moulding, Sheet-metal Working.

(b) *Student Apprenticeship.* This is a 4- to 5-year course for students who have passed O or A or equivalent examination. General background training is given, and the apprentice has the opportunity of specialising. Those who complete their training satisfactorily can expect to become responsible members of the staff of an engineering concern.

(c) *Graduate Apprenticeship.* This is designed to provide the practical background for those who hold degrees or diplomas in engineering. The course lasts about 2 years and is designed to fit graduate apprentices for posts in Research, Development, Design, Estimating, Contracting, Sales, and Production.

Address.

The Institution of Mechanical Engineers, 1 Bird Cage Walk, S.W.1.

7. Mining Engineering.

(a) *Coal Mining.* The National Coal Board runs its own system of training and apprenticeship schemes, full details of which can be obtained from the address below. Of special interest to Sixth Formers leaving school are the 100 University Scholarships offered each year by the National Coal Board for suitable boys who wish to take up mining engineering. These Scholarships are tenable at any University offering a mining-degree course, and the National Coal Board assumes entire responsibility for fees and maintenance—irrespective of parents' income. It should be noted that some scholarships are also available for degree courses in mechanical, electrical and chemical engineering.

Address.

The National Coal Board, Hobart House, Grosvenor Place, S.W.1.

(b) *Metalliferous Mining.* Young men who wish to qualify as mining engineers in this sense of the word usually study for a degree or equivalent qualification at either the Royal School of Mines (South Kensington) or the Camborne School of Metalliferous Mining (Cornwall). It is also possible to specialise in Metalliferous Mining at some of the Universities offering Mining Engineering courses.

The work of a Mining Engineer who has specialised in this department of mining usually takes him abroad. He may be involved in discovering mineral deposits, extracting the ore from the ground, or refining. There is a limited number of scholarships available, details of which may be had from the first address below. Candidates for courses must be aged 18 and hold A or equivalent.

Addresses.

British Overseas Mining Association, 8 Great Winchester Street, E.C.2.

Institution of Mining and Metallurgy, 44 Portland Place, W.1.

8. Production Engineering.

The Production Engineer is concerned with every aspect of manufacture where planning of output in the most economical way is concerned. He is the expert on works management, production management planning, plant layout, jig and tool design, estimating, time-study, rate-fixing, motion study, process study, production control, inspection, purchasing, and stores control. He must be a man who can mix easily and command confidence and respect.

There are three main ways of becoming a production engineer:

(a) *Production Engineering Apprenticeship.* A 5-year course supplemented by part-time study for O.N.C. and H.N.C. and then for the Associate Membership Examination of the Institution.

(b) *Sandwich Course* (3–5 years) leading to H.N.C. in production engineering or Dip.Tech.

(c) *Engineering Degree* (3–4 years), followed by 2 years' practical work with a firm.

Address.

Institution of Production Engineers, 10 Chesterfield Street, W.1.

As already stated, the foregoing is a selection only of the various careers available in engineering. The following is a list of the professional bodies associated with other branches of the profession, and full details of method of entry, training, and prospects can be obtained from them:—

1. *Gas Engineering.*

The Institution of Gas Engineers, 17 Grosvenor Crescent, S.W.1.

2. *Heating and Ventilating Engineering.*

The Institution of Heating and Ventilation Engineers, 49 Cadogan Square, S.W.1.

3. *Illuminating Engineering.*

The Illuminating Engineering Society, 32 Victoria Street, S.W.1.

4. *Marine Engineering.*

The Institute of Marine Engineers, The Memorial Building, 76 Mark Lane, E.C.3.

5. *Radio and Electronic Engineering.*

The British Institution of Radio Engineers, 9 Bedford Square, W.C.1.

6. *Railway Engineering.*

The Director of Training and Education, British Transport Commission, 222 Marylebone Road, N.W.1.

7. *Structural Engineering.*

The Institution of Structural Engineers, 11 Upper Belgrave Street, S.W.1.

8. *Water Engineering.*

The Institution of Water Engineers, Parliament Mansions, Abbey Orchard Street, S.W.1.

9. *Welding Engineering.*

The Institute of Welding, 54 Princes Gate, Exhibition Road, S.W.7.

Pamphlets.

Choice of Careers Series:—

No. 78, *Engineering Work for Boys* (H.M.S.O.), 1*s.* 9*d.*

No. 77, *Engineering Work for Girls* (H.M.S.O.), 1*s.* 3*d.*

No. 92, *The Professional Engineer* (H.M.S.O.), 1*s.* 9*d.*

No. 60, *Engineering Draughtsman* (H.M.S.O.), 1*s.*

Training Opportunities for Women in Engineering, 3*s.* 6*d.* Available from Women's Engineering Society.

FIRE SERVICE.

B.

Age. 19–31 (35 for ex-regulars from the Forces).

Qualifications. Ability to pass simple education test.

Pay. From £9 10*s*. per week—over £1,000 p.a. in Divisional Office posts.

Aptitudes. Ability to serve as member of team, physical strength.

Method of Entry. By application to the Chief Officer of Fire Brigade in question.

Further Training. 2–3 months' course of training at a Brigade Training School.

There are certain minimum physical requirements for a Fireman. He must be not less than 5 ft. 7 in. tall and be able to pass a fairly strenuous medical examination. Promotion to the rank of leading fireman is by examination after 2 years' service, and to the rank of sub-officer after 4 years' service.

There are opportunities for further advanced training at the Fire Service College for chosen officers. Service is pensionable, and dependants are provided for in case of death.

Address.

The Institution of Fire Engineers, 94 Southwark Bridge Road, S.E.1.

FLORISTRY.

G.

Age. 15+

Qualifications. None laid down.

Pay. About £6 per week as an assistant.

Aptitudes. Sense of colour and arrangement. Pleasant manner and ability with hands.

Method of Entry.

1. Assistant in florist's or, if possible, apprenticeship to florist.
2. Course at a School of Floristry.

Further Training.

1. 3-year apprenticeship to florist in conjunction with day part-time study leading to examination of Society of Floristry (London Area only).
2. Diploma course at a School of Floristry (9 months–1 year).

A florist's work involves not only the selling of flowers in a shop, but the designing and preparation of bouquets, wreaths, display baskets, etc., for special occasions, and the floral decoration of hotels and halls for functions and exhibitions.

There are two schools in London offering full-time courses, and attendance at one of these is probably the better method of gaining a thorough grounding in all aspects of the work. They are:—

The Constance Spry Flower School, 29 Elm Tree Road, N.W.8.
The London School of Floristry, 1 Ravenscourt Park, Hammersmith, W.6.

Addresses.

The Society of Floristry, 7 Henrietta Street, W.C.2.

British Flower Industry Association, 35 Wellington Street, Covent Garden, W.C.2.

Book.

Making Floristry Your Business, by Angela Johnson (Southern Editorial Syndicate Ltd.), 6*s*.

FORESTRY.

B.

Age.

1. Forest Workers, 16+.
2. Foresters, 19–30 (38, if ex-regular servicemen).
3. Forest Officer 21+

Qualifications.

1. Forest Worker —.
2. Forester—O.
3. Forest Officer—Degree in Forestry.

Pay.

1. Forest Worker, £8 10*s*. per week.
2. Forester, £397–£898 p.a. (+ house or cash allowance).
3. Forest Officer, £765–£1,190 (minimum scale).

Aptitudes. High standard of fitness; liking for country life; self-reliance and ability to handle men, especially in Forester grades and above.

Method of Entry.

1. Forest Worker: By application to Youth Employment Officer or direct to a Forester.
2. Forester: By application to a Forester Training School (1 year's practical experience a prerequisite).
3. Forest Officer: Acceptance by Selection Board of Forestry Commission (for those holding degree).

Further Training.

1. Forest Worker, practical training while working.
2. Forester, 2-year course at Residential Forestry School. (There may be a waiting list for these schools; 2 years' delay is not uncommon.)

Work in Forestry is varied. Forest workers are those who do the practical work in the woods, involving the care of trees, thinning, felling, and sawmill work. Foresters are in charge of areas of woodland, and Forest Officers are in overall charge of whole regions and concerned with long-term plans for development and afforestation. There are also various openings overseas for the last category through the Overseas Civil Service.

In addition to the posts available with the Forestry Commission, attractive jobs are open to graduates in Forestry as managers of privately owned land, and in the timber trade.

Addresses.

The Forestry Commission, Education Branch, 1 Princes Gate, S.W.7.

Royal Forestry Society of England and Wales, 49 Russell Square, W.C.1.

Empire Forestry Association, Royal Empire Society, Northumberland Avenue, W.C.2.

Pamphlets.

Choice of Careers, No. 81 (H.M.S.O.), 1*s*. 9*d*.

Training as a Forester. Available from The Forestry Commission.

HAIRDRESSING.

B. G.

Age. 16+.

Qualifications. —

Pay. Apprentices: 34*s*. to £3 10*s*. per week.
Men: £7 12*s*. per week (minimum after 2 years).
Women: £6 11*s*. per week (minimum after 2 years).

Aptitudes. Pleasant manner, unruffled air, self-confidence, cleanliness.

Method of Entry.

1. Apprenticeship to Master Hairdresser.
2. Full-time course at School of Hairdressing under Local Education Authority auspices.
3. Full-time course at private school of hairdressing.

Further Training.

1. As apprentice, 3 years, supplemented by part-time study.
2. As student at School of Hairdressing sponsored by Local Education Authority, 2 years.
3. As student at private school. Usually 3–6 months. Some of these are not recognised by the trade, enquiries should always be made to the official bodies.

The hairdresser, whether man or woman, is nowadays a member of a highly skilled profession offering an attractive career to those who are prepared to study and have a flair for getting on with people. It is pointed out that the above are minimum rates, and take no account of tips, which are a traditional aspect of the business.

Apprentices and students at L.E.A.-directed Schools of Hairdressing study for the examinations of the City and Guilds of London Institute or the Entrance Examination of the Hairdressers' Registration Council. The courses at private schools are much more intensive and quite expensive (*e.g.*, £70 for a six-month course), but the period of study is, of course, much shorter. Grants are rarely allowed at private schools by Local Authorities.

L.E.A. establishments holding courses include:–

Barrett Street Technical College, Barrett Street, W.1.

Erith Technical College, Belvedere, Kent.

Full details of courses in private schools can be obtained from the associations named below.

Addresses.

The National Hairdressers' Federation, 20 Cranbourne Gardens, N.W.11.

The Incorporated Guild of Hairdressers, 33 Great Queen Street, W.C.2.

HEALTH VISITOR.

G.

Age. 21+.

Qualifications. Either (i) State Registered Nurse, or (ii) Registered Sick Children's Nurse. Holding in either case, Part I of the Certificate of the Central Midwives' Board.

Pay. £555–690 p.a.

Aptitudes. Initiative and good health. Interest in others and flexibility of temperament and tact.

Method of Entry. Acceptance on a Health Visitor Training Course at an institution recognised by Ministry of Health (see below).

Further Training. 9–12 months' Training Course leading to Health Visitors' Certificate.

The Health Visitor is concerned with the health of the entire family. She has to be able to advise mothers, expectant mothers, and foster mothers about their own and their family's health. She must be prepared to give advice on how to prevent the spread of infection (in, for example, T.B. cases where the sufferer is living at home), and to visit the very young and the very old. There is a serious shortage of Health Visitors, and a girl whose interest lies in nursing and who wishes to render personal service to the community would find this an absorbing and dedicated career.

The Women Public Health Officers' Association can supply a list of the recognised training centres or authorities.

Addresses.

Women Public Health Officers' Association, 36 Eccleston Square, S.W.1.

Royal Society for the Promotion of Health, 90 Buckingham Palace Road, S.W.1.

The Royal Sanitary Association of Scotland, 185 St. Vincent Street, Glasgow.

HOSPITAL ADMINISTRATION.

B. G.

Age. 16–20.

Qualification. Usually O.

Pay. About £4 per week at age 16—about £550 (on lowest grade).

Aptitudes. Initiative, good judgment, ability to mix.

Method of Entry.

1. As a Junior Clerk.
2. As a graduate (limited number only).

Further Training. Part-time study in preparation for professional qualifications (very often the examination of the Institute of Hospital Administrators).

Hospital Administration is a term covering the work of about 450 hospital management committees right down to the day-to-day administrative running of a particular department in a particular hospital. The clerk who gains qualifications as a result of part-time study and who is prepared to move from one part of the country to another has real opportunities for promotion.

There are two stages in the examinations of the Institute of Hospital Management:

1. *Intermediate* (Candidates must be at least 18 years of age):
   Part I comprises papers on Public Administration, Economics, and the Hospital and Health Services.
   Part II comprises papers on Secretarial Practice, Commercial Law, Book-keeping, Statistics (3 only to be taken).
2. *Final* (Candidates must be at least 21 and have completed at least 3 years in Hospital Administration):
   Part I comprises papers on Hospital Administration, Hospital Finance, General Law affecting Hospitals.
   Part II. 3 subjects must be offered from a comprehensive list covering many of the aspects of Hospital Administration, *e.g.*, Accountancy, Supplies, Personnel Management, Records.

All posts are pensionable, and holidays vary according to age and status.

Address.

The Institute of Hospital Administrators, 75 Portland Place, W.1.

Pamphlet.

Careers in Hospital Administration. Available from The Institute.

HOTEL RECEPTIONIST.

G.

Age. Usually 16–20.

Qualifications. Preferably O + knowledge of typewriting and book-keeping + 1 foreign language (if possible).

Pay. In accordance with Wages Council Order in operation at time (see below).

Aptitudes. Pleasant manner, patience, liking for people, and ability to get on with them. Accuracy and trustworthiness.

Method of Entry.

1. As a trainee-receptionist, *i.e.*, by application to the manager of a large hotel.
2. By training at a technical college.

Further Training. 1 year's full-time course at Technical College leading to the Hotel Book-keeping and Reception Examination of the Hotel and Catering Institute.

The Hotel Receptionist is usually the person who welcomes guests on their arrival, and she can often, therefore, create a good initial impression if she possesses a pleasant and sympathetic manner. She is also responsible in many cases for correspondence about accommodation, the keeping of records, and preparation of accounts for visitors.

It is difficult to give any reliable information about salaries, as these vary according to the facilities the Receptionist enjoys in her hotel. If, for example, she has a room in the hotel and full service, her salary will not be so high as that of someone who lives out.

The year's full-time course referred to above is available at the following Technical Colleges:

Acton Technical College, Woodlands Extention, Acton Hill, W.3.

Blackpool Technical College, Courtfield, Hornby Road, Blackpool.

North Gloucestershire Technical College, The Park, Cheltenham (minimum age of entry 18 years).

Cornwall Technical College, Trevenson, Pool, Redruth.

South Devon Technical College, Teignmouth Road, Torquay.

Address.

The Hotel and Catering Institute, 24 Portman Square, W.1.

Pamphlet.

Choice of Careers Series, No. 33 (H.M.S.O.), 1*s.* 6*d.*

INSURANCE.

B. G.

Age. 16–25.

Qualifications. Usually O but increasingly A.

Pay. About £300 at age 17. About £600 at age 25. Thereafter to about £800+.

Aptitudes. Ability with figures and ability to express oneself clearly in writing. Pleasant personality and wide interests.

Method of Entry. By application to secretary of company.

Further Training. Part-time study for the examinations of the Chartered Insurance Institute.

Insurance work falls into four main categories—Fire, Marine, Life, and Accident. Some insurance companies deal with all these branches, while others specialise in one only. Some companies run their own training scheme for new entrants, or allow time off for study during office hours. Others send trainees on full-time courses of several weeks' duration. All encourage their employees to study for the examinations of the Chartered Insurance Institute.

These are:—

1. Preliminary ("A" entitles the new entrant to exemption).
2. Associateship (in 3 parts).
3. Fellowship (in 3 sections).

Each individual will take the advice of his employers as to which branch of study to follow up.

After preliminary training, the young man has to decide whether he wishes to specialise in indoor or outdoor work. The former leads to promotion to the position of chief clerk or superintendent for those who show promise, and there is ample opportunity for specialisation. The latter, involving probably more contact with people, leads to posts such as Inspector or Fire Surveyor.

While it is true that girls can follow a similar indoor career in insurance and are eligible for the same examinations, the majority of jobs for girls are of a clerical or secretarial nature. Here the path of promotion is towards specialised clerical work, confidential secretarial posts, accountancy, or technical work.

Some companies have a limited number of vacancies for graduate entrants in administrative and foreign posts.

With most companies, welfare and pension arrangements are excellent and employees are encouraged to join the various sports and social clubs.

Address.

The Chartered Insurance Institute, The Hall, 20 Aldermanbury, E.C.2.

Pamphlets.

Careers for Men and Women, No. 7 (H.M.S.O.), 9*d.*

Insurance—a career for girls. Available from The Chartered Insurance Institute.

That's a Good Job. Available from the Chartered Insurance Institute.

JOURNALISM.

B. G.

Age. 16+.

Qualifications. Usually at least O + preferably a knowledge of shorthand and typing.

Pay. £3 3*s.* (at age 16) to £10 14*s.* 6*d.* (at age 23). These are minimum provincial scales.

Aptitudes. Ability to mix with all types of people, adaptability, initiative, and independence.

Method of Entry. Usually by application to provincial or surburban weekly.

Further Training. 5 years made up as follows:—

1. 6 months' probation.
2. 3 years' articled apprenticeship.
3. 18 months' course leading to National Diploma.

One of the most difficult things about Journalism as a career is actually getting started. Many young people at school who develop an interest in writing feel that they would like to take up this career, only to find that it is very hard to get a job. The best method is to write to the editor of as many provincial or local papers as possible, and of course be prepared to go where the work is. Addresses of all newspapers can be found in *Willing's Press Guide.*

While waiting for a vacancy it is a good thing to work up proficiency in shorthand and typing.

It is sometimes possible to obtain a post on some newspapers as a graduate, and for graduate entrants (aged 24 or over) there is a special 2-year course leading to a Certificate of Training of the National Council for the Training of Journalists. The more normal method is, however, that outlined in the Further Training paragraph above, where, during the 3-year apprenticeship, the new entrant is trained in all aspects of reporting. At the same time the apprentice follows a part-time course (either by correspondence or at a Technical College) in English, Central and Local Government, British Life and Institutions, a special Law Course, and an optional subject.

Full details of these courses and of the final 18-month course for the National Diploma are given in the *Handbook of Training* published by the National Council.

It should be emphasised that the salary details given above are the minimum provincial scale only, and for those who can really make their way in Journalism the rewards are considerable.

Addresses.

The Institute of Journalism, 2–4 Tudor Street, E.C.4.

The National Union of Journalists, 22 Great Windmill Street, W.1.

The National Council for the Training of Journalists, 88 Fleet Street, E.C.4.

Pamphlet.

Choice of Careers Series, No. 83 (H.M.S.O.), 1*s.* 6*d.*

LAUNDRY MANAGEMENT.

B. G.

Age. 15+.

Qualifications. Preferably O.

Pay. Depending on age, experience, and responsibility, but minimum rates are laid down in Orders of Laundry Wages Council.

Aptitudes. Ability to handle varying types of people.

Method of Entry.

1. By application to a firm.
2. Acceptance on 2-year full-time course (minimum age 18 years).

Further Training.

1. *Learnership Scheme.* Practical training and background instruction during work, supplemented by part-time study for appropriate examinations of City and Guilds of London Institute.
2. 3-year *Apprenticeship.* Available for boys only and in a few firms only, supplemented by part-time study as in (1) above.
3. *Trainee Manager/Manageress Scheme.* Available for suitable persons of 18 years and over.
4. *Full-time Laundry Management Course.* 2 years. Candidates must hold O and be 18 years or more.

There are over 4,000 laundries in the country, and there is considerable scope in this still-expanding industry for the ambitious boy or girl who is prepared to work hard. There are basically three processes in laundry work: sorting of articles with regard to treatment, washing or cleaning, and finishing (*i.e.*, ironing or pressing), and the would-be manager or manageress must become thoroughly acquainted with, and have practical experience of, all the processes involved. The apprentice or learner must also become familiar with business methods and management techniques. There is plenty of exacting work for an intelligent boy or girl who is prepared to study hard.

In addition to the usual Local Education Authority Grants, which may be available for many who wish to follow a full-time course, the Laundry Industry offers some scholarships. Full details can be obtained from the first address below.

Addresses.

The Laundry Industry Education Board, 16–17 Lancaster Gate, W.2.

The Institute of British Launderers Ltd., 16–17 Lancaster Gate, W.2.

Pamphlet.

Choice of Careers Series, No. 70 (H.M.S.O.), 1*s.* 3*d.*

LAW.

B. G.

(*a*) **Barrister.**

Age. No person may be called to the Bar before the age of 21.

Qualifications.

1. O minimum (for admittance to one of the Inns of Court).
2. The "keeping" of 12 terms (see below).
3. Success in Bar Examinations.

Pay.

1. In private practice, income depends on many factors, mention of which is made below.
2. In Civil Service and with private undertakings—about £900–£2,000, or even higher.

Aptitudes. Clarity of thought and language. Good health. Wide general knowledge.

Method of Entry. Acceptance by one of the Inns of Court as a student.

Further Training. At least 12 months as a pupil of a practising barrister. Then perhaps a further period of "devilling" (see below).

The Bar is the senior branch of the profession, and only a barrister can plead in the higher courts.

The profession of barrister (in private practice) while being one of the most respected is, initially, at least, one of the most precarious. First, admission to one of the Inns of Court has to be obtained and the fees have to be paid. The four Inns and the composite fees are as follows:—

The Inner Temple £56 17*s.* 6*d.*
The Middle Temple £56 16*s.* 0*d.*
Lincoln's Inn £56 16*s.* 0*d.* (+ £12 composition fee).
Gray's Inn £56 16*s.*

The student then has to "keep" 12 terms, *i.e.*, dine in Hall on any 6 days of each term. Students who are studying for a University degree at the same time are allowed to "keep term" by dining in 3 times a term only. The Bar Examination is divided into two parts, as follows:—

Part I. Roman Law; Constitutional Law and Legal History; the Law of Contract and Tort; the Law of Real Property; Criminal Law.

Part II. Criminal Procedure; General Principles of Equity; Company Law and either Practical Conveyancing or Divorce Law or Public International Law; Evidence and Civil Procedure; a special subject; a general paper.

The next step is to be "called," which is the slightly ritual acceptance of the student into the profession (providing the Call Fees have been paid).

At this point the young barrister has to decide whether there is enough money available to continue into private practice. This will entail a premium of up to 100 guineas for the privilege of working for an established barrister and so learning the practical side. Thereafter the new barrister *may* be lucky enough to be asked to "devil," *i.e.*, to carry on the more humdrum and routine tasks for a nominal salary. This devilling is an important period in the barrister's career, as it is at this time that he makes the necessary contacts for establishing his own practice. (It should be remembered that advertisement is not allowed.) When finally a private practice is set up several lean years must be anticipated before the newcomer is well known by the solicitors who are to provide him with briefs.

Many barristers prefer to take appointments either with the Civil Service or with large private firms which retain legal staffs. This is indeed often the only way of making a career for those who cannot afford the substantial outlay involved in embarking on private practice.

The Scottish system is entirely different, and information can be obtained about how to become an Advocate in Scottish Law by application to the Faculty of Advocates at the address given below.

Addresses.

The Inner Temple, E.C.4.

The Middle Temple, E.C.4.

Lincoln's Inn, W.C.2.

Gray's Inn, W.C.1.

The Faculty of Advocates, Parliament Square, Edinburgh.

(*b*) **Solicitor.**

Age. No person under the age of 21 may be admitted as a Solicitor.

Qualifications. At least O (to commence articles).

Pay.

1. About £600 p.a. as qualified salaried assistant in private practice. Thereafter according to ability and opportunity.
2. *Public Service*, about £900 (starting salary)—over £2,000 in some cases.

Aptitudes. Tact, patience, integrity, capacity for detail.

Method of Entry. As articled clerk to solicitor, in private practice or in public service, *e.g.*, Town Clerk.

Further Training. 5 years from taking of articles (3 years for a graduate) combined with part-time study for the Law Society's Intermediate and Final Examinations.

The solicitor comes into contact with the public chiefly when they need legal advice or representation, especially in connection with the purchase and sale of houses, the making of wills, matrimonial affairs, and general litigation. Not so well known is the whole aspect of Company work involving the flotation of companies, bankruptcy, and company law generally.

During articles, a clerk must attend at a recognised law school for legal instruction on either a full-time or part-time basis. Exemption is allowed for barristers, graduates in law, and clerks with 10 years' experience or more.

The Intermediate Examination of the Law Society is in two parts, which may be taken separately. Part I consists of Real Property Law, Law of Contract and Torts, Public Law, Constitutional Law, and Criminal Law. Part II is concerned with Accounts and Book-keeping.

The Final Examination consists of Real and Property Law, Law of Trusts and Succession, Tax Law, Contract, Tort, Company Law, and Partnership Law.

Once admitted, the new solicitor has the choice of aiming for a private practice or going into Public Service. In the former case the usual thing is to secure a post as a managing clerk with a firm of solicitors with the idea of eventual partnership in mind. For those who choose Public Service, prospects of promotion and increased responsibility are very good.

The Scottish system is slightly different, and information about how to become a solicitor in Scotland can be obtained from the second address below.

Addresses.

The Law Society, Law Society's Hall, Chancery Lane, W.C.2.

The Law Society of Scotland, Law Society's Hall, North Bank Street, Edinburgh.

Pamphlets.

Choice of Careers Series, No. 26 (H.M.S.O.), 1*s.*

Lawyers in the Government Service. Available from The Civil Service Commission, 6 Burlington Gardens, W.1.

LIBRARIANSHIP.

B.G.

Age. 17–20.

Qualification. O.

Pay. £260 p.a. (Girls £244)–£560. After qualification, £575+, depending on status.

Aptitudes. Methodical mind, capacity for detail, good memory, friendly demeanour.

Method of Entry. By application to Librarian of a Public Library.

Further Training.

1. Part-time study for the First Professional Examination. Then—
2. 1 year's full-time or 3 years' part-time study for the Registration Examination.

Librarianship is a term covering not only the services of the Public Libraries but also the University and College libraries and those of the learned and professional bodies. Very often in the case of the latter, very high academic qualifications are demanded, and in this section we are chiefly concerned with the public-library system as a career. The Junior joining a staff will find that at first a lot of time is spent in routine matters—the arranging of books, filing and indexing, and counter duties. At the same time the beginner will be expected to study for the First Professional Examination. It is pointed out that "A" standard in one foreign language is an advisable qualification, as this is a compulsory requirement for the Registration Examination, which has to be passed before any real promotion can be expected in the service.

Study for this examination can be done either at a full-time course lasting one year at a School of Librarianship or by part-time study at a Technical or Commercial College (or, failing this, by following a correspondence course offered by the Association of Assistant Librarians). Those who wish to follow the full-time course can often obtain leave of absence from their library and are eligible, subject to individual circumstances, for financial assistance from Local Authorities.

Graduates who wish to acquire library qualifications can follow the Diploma Course of the London School of Librarianship and Archives (1-year, full-time).

The general salary pattern in the Library Service is that juniors and those who are not yet Chartered Librarians (*i.e.*, aged 23, with 3 years' service, having passed the Registration Examination) are not very highly paid, but for the qualified man or woman the range extends through seven grades to over £2,000 p.a. Promotion, however, is slow, and very often entails moving to another part of the country in order to take a higher post.

Address.

The Library Association, Chaucer House, Malet Street, W.C.1.

Pamphlets.

Choice of Careers Series, No. 4 (H.M.S.O.), 9*d.*

The Library Profession. Available from The Library Association.

LOCAL GOVERNMENT SERVICE.

B. G.

Age. Usually 16.

Qualification. O for entry into General Division.

Pay. £230–£560 (General). Other Divisions and grades correspondingly higher.

Aptitudes. Impartiality, sense of duty.

Method of Entry. By examination, interview, or in reply to advertisement, depending on Authority.

Further Training. Part-time study for the appropriate professional or technical examinations.

Local Government is a term covering the work of the following types of local authority: County, County Borough, Borough, Metropolitan Borough, Urban District, and Rural District. These authorities are responsible for the administering of a very wide range of public services: *e.g.*, education, public health, housing, road work, police, fire services, civil defence, welfare, libraries, swimming-pools, playing fields, etc.

There are about 180,000 Local Government Servants in England and Wales. They are divided into the following classes:—

(i) General.
(ii) Clerical.
(iii) Miscellaneous.
(iv) Administrative, Professional and Technical (known as A.P.T.) which is subdivided.

The school-leaver will normally enter the General Division, and his or her subsequent career

depends on record and the passing of the appropriate examinations.

It is important that one should start in a branch of Local Government in which one's own inclinations and preferences for a particular type of work can be developed.

The main departments are:—

1. **The Clerk's Department**, which looks after the legal side of Local Government. There is considerable variety of work, and it is often possible to arrange to serve under articles (*see* **Law**). Highest positions are increasingly reserved for graduates.
2. **The Treasurer's Department**, which is responsible for the finances of the authority. The ambitious beginner will study for accountancy qualifications (*see* **Accountancy**).
3. **The Housing Department**, which is in many authorities steadily increasing in importance. Architects, Surveyors, Engineers, Managers are all required, and facilities exist for acquiring professional status in many aspects of the work.
4. **The Engineer's Department.** A professional Engineering qualification, acquired either before or during service, is essential for those who seek promotion. The department is concerned with roads, drainage, sewerage, municipal buildings, and general development (*see* **Engineering**).
5. **The Public Health Department.** Under the control of the Medical Officer of Health, this is concerned with the general health of the public. School Medical and Dental Officers, Public Health Inspectors, Food Inspectors, Health Visitors, Midwives, etc., belong to this department.
6. **Education Department**, which is responsible for the administration of the Schools, Further Education Colleges, Youth Service, and Youth Employment Bureaux. The higher posts in this department offer an alternative career to those who have teaching experience (who are not themselves Local Government Officers) and indeed are usually reserved for former teachers.

All these departments, as well as the others which have been mentioned, require administrative and clerical employees in addition to the specially qualified technical people, such as doctors and engineers, and there is certainly no need for boys or girls to feel that by entering the Service at school-leaving age they are condemned to a humdrum life on a third-rate salary for the rest of their days. The interests of staff are looked after by the National and Local Government Officers Association, posts are pensionable (contributory), and welfare arrangements are good.

Addresses.

The National and Local Government Officers Association, 1 York Gate, Regents Park, N.W.1.

The Local Authorities Conditions of Service Advisory Board, 41 Belgrave Square, S.W.1.

MEDICAL LABORATORY TECHNOLOGY.

B. G.

Age. 16+.

Qualifications. Usually O.

Pay. £210 p.a. (at age 16)–£415 p.a. (at age 25); then (when qualified) £655 p.a., with possibility of higher appointments.

Aptitudes. Patience, interest in science, attention to detail, reliability.

Method of Entry. By application to the Area Pathologist of the Hospital Management Committee concerned.

Further Training. Part-time study for the examinations of the Institute of Medical Laboratory Technology.

Medical Laboratory Technology is the study and practice of the technical methods used in laboratory work to ascertain the nature of diseases, usually from specimens of body tissue, blood, etc. It is of great interest to the school-leaver who is interested in science and prepared to continue studies in spare time. The work is such that the pathologists under whom the technicians work must have absolute confidence in the reliability and accuracy of their juniors.

The beginner has to obtain a post as indicated above, and then apply for registration by the Institute as a student. Much of the practical instruction is by a Senior Technician in the course of duties. The Intermediate Examination of the Institute is taken after 3 years' experience and thereafter, having gained the status of a Junior Technician, the young man or woman has a further 2 years' part-time study for the Final Examination.

There is continuing development in the Health Services, and prospects for new entrants are reasonably good.

Address.

The Institute of Medical Laboratory Technology, 9 Harley Street, W.1.

Pamphlets.

M.L.T. as a Career. Available from the Institute.

Choice of Careers Series, No. 57 (H.M.S.O.), 1*s.* 6*d.*

MEDICINE.

B. G.

Age. 17 years 9 months (minimum).

Qualifications. A in chemistry, physics, biology. Sometimes O + Pre-Medical Examination (First M.B.).

Pay.

1. Hospital Service: about £500 p.a. to over £3,000 (Consultants).
2. General Practice, depending on size of practice. In the National Health Service there is a capitation fee for every patient on doctor's list up to £3,500+.
3. In Public Health, Industry, Armed Forces, Colonial Medical Service, about £1,000 to over £2,000.

Aptitudes. Patience, calmness of manner, interest in other people, capacity for hard work.

Method of Entry. Acceptance as a student by one of the Medical Schools.

Further Training. At least 5 years' full-time study for degree or diploma, followed by one year as a "house-surgeon" in a hospital.

It is important for the would-be doctor to ensure, while still at school, that the Sixth Form syllabus being followed is the best preparation for medical training. "A" level in chemistry, physics, and biology means exemption from the First or Pre-Medical Examination, which otherwise entails a whole year's study at a Technical College or Medical School. It must also be remembered that expenses may be even heavier than in other forms of training, and although help is available from Local Education Authorities and through Scholarships, this is bound to be an anxious time for parents of moderate means.

When the student has passed the Final Examinations of the course he is following, he or she has to spend 1 year as a house-surgeon in an approved hospital or institution before starting in a practice. Doctors in general practice need to have great reserves of physical strength, patience, and endurance. Unless they can come to some sort of "duty" arrangement with other doctors practising in the locality, or unless they work in

a partnership, they must expect to have little time they are certain to be able to call their own.

Many newly qualified doctors prefer to work for public authorities or in large industrial or commercial concerns, where at least work is usually in line with office hours. For those who like community life, the Armed Services offer a secure and well-paid career with the opportunity of seeing much of the world.

The following is a list of the Medical Schools which offer courses in Medicine:

Aberdeen University.
Belfast, Queen's University.
Birmingham University.
Bristol University.
*Cambridge University.
Cork, University College.
Durham University.
Dublin—
  Trinity College.
  University College.
  Royal College of Surgeons.
Edinburgh University.
Galway, University College.
Glasgow University.
Leeds University.
Liverpool University.
Manchester University.
*Oxford University.
St. Andrews University.
Sheffield University.
Welsh National School of Medicine, Cardiff.
London University—
  St. Bartholomew's Hospital.
  Charing Cross Hospital.
  Guy's Hospital.
  King's College Hospital.
  London Hospital.
  Middlesex Hospital.
  St. George's Hospital.
  St. Mary's Hospital.
  St. Thomas's Hospital.
  University College Hospital.
  Royal Free Hospital.
  Westminster Hospital.

* These universities offer only the pre-clinical 3-year course. Except in rare cases the clinical period of training, another 3 years, must be done elsewhere.

Addresses.

General Medical Council, 44 Hallam Street, W.1.

English Conjoint Board, 8 Queen Square, W.C.1.

Irish Conjoint Board, Royal College of Surgeons in Ireland, St. Stephen's Green, Dublin.

Scottish Conjoint Board, 18 Nicolson Street, Edinburgh, 8.

Pamphlet.

Careers for Men and Women, No. 32 (H.M.S.O.), 6*d*.

MERCHANT NAVY.

B.

Age.

Navigation Officers, 16–17½.
Engineer Officers, 16+.
Radio Officers, 16½+.

Qualifications.

1. Usually O to start training.
2. Ministry of Transport Eyesight Certificate.

Pay.

Navigation Officers, £50–£170 per month on completion of training.
Engineer Officers, £42–£156 per month on completion of training.
Radio Officers, £28 10*s*.–£71 per month on completion of training.

Aptitudes. Self-reliance, capacity for unstinted work, first class eye-sight, physical fitness, sense of adventure.

Method of Entry.

(a) *Navigation Officer.*
  1. By acceptance at Training School (see address below).
  2. By application to shipping line.

(b) *Engineer Officer.*
  1. By apprenticeship in marine works or shipbuilding yard.
  2. Acceptance by a shipping company on full-time Technical College course, combined with seagoing and workshop experience.

(c) *Radio Officer.* Acceptance in a school to train for Postmaster General's Certificate.

Further Training.

(a) *Navigation Officer.*
  1. Course of pre-sea training at approved training school plus shortened apprenticeship.
  2. 4 years' apprenticeship with shipping line.

(b) *Engineer Officer.*
  1. 4 years' marine engineering experience ashore plus 18 months' sea service.
  2. 4 years' apprenticeship with shipping company.

(c) *Radio Officer.* 12–16 months' training for the Postmaster General's Certificate.

As will be gathered from the above, careers in the Merchant Navy fall usually into the categories of Navigation, Engineer, and Radio. The future Navigation Officer has to study as an apprentice for the Certificate of Competency, which qualifies him as a Second Mate. After a further 12 months at sea he is able to sit for the First Mate's Certificate, and 2½ years later for the Master's Certificate. During this sea time he can pursue his studies by correspondence course.

The pattern for Engineer Officer is similar, except that the 4 years' apprenticeship is on land in a works preferably connected with the shipbuilding industry. On completion of his apprenticeship the young engineer spends 21 months at sea before taking the Second Engineer's Certificate and a further similar period before the Chief Engineer's Certificate. There is an alternative method for boys with "O" level or equivalent qualifications which comprises 2 years' full-time Technical College work followed by 18 months' practical engine-room experience at sea, and a further year in a shipyard or marine works.

The necessary qualifications for a Radio Officer have to be obtained before the beginning of service afloat, and it is a wise precaution to ensure that one has the necessary physical requirements before starting a course, in order to avoid possible disappointment later.

Radio Officers are employed by the Radio Companies, and not by the shipping companies, and application should be made to the former.

The life of a Merchant Navy Officer varies according to whether he is employed on "home" or "foreign" work (*i.e.*, short-range or long-range shipping) and according to the type of ship he is working. For example, an officer on a deep-sea oil-tanker may spend relatively long periods away from home, but this is compensated by longer home leave. The social demands on board a large passenger liner will, of course, be greater than if one is serving on a little cargo vessel. But the qualities required in every branch and on every type of ship are the same—trustworthiness, intelligence, ability to get on with others, and willingness to take responsibility. For those possessing these qualities, the sea offers a fine and interesting career.

Addresses.

The Shipping Federation Ltd., 52 Leadenhall Street, E.C.3.

For Radio Officers:—

International Marine Radio Co. Ltd., 29 Progress Way, Croydon.

The Marconi International Marine Communication Co. Ltd., Marconi House, Chelmsford, Essex.

Messrs Siemens Bros. & Co. Ltd., Woolwich, S.E.18.

For Eyesight Tests:—

Mercantile Marine Office, at any big port in the United Kingdom.

London County Council Training School for which grants from other Local Authorities also are usually awarded:—

The King Edward VII Nautical College, 680 Commercial Road, E.14.

No. 73, *Merchant Navy Ratings* (H.M.S.O.), 1*s.* 9*d.*

MIDWIFERY.

G.

Age. 20–50.

Qualifications. Usually O and often A.

Pay. £457–£568.

Aptitudes. Good health, interest in people, sense of vocation.

Method of Entry. Acceptance on a Nursing course at an approved hospital.

Further Training.

1. For State Registered General or Sick Children's Nurses, 1 year.
2. For all others, 2 years.

The career of midwife is an attractive one for the girl who is interested in people, and who feels a vocation for some form of service to others. Since the National Health Service came in, there has been an increasing demand for the midwifery services.

Midwives, with 3 years' experience or more, and who have assisted with the training of pupils, are eligible to enter for the Midwife Teacher's Diploma. Study for this can be either full or part-time, and the possession of the Diploma is indispensable for those who seek promotion to senior teaching and administrative posts.

Addresses.

Central Midwives' Board, 73 Great Peter Street, S.W.1.

Central Midwives Board for Scotland, 18 Nicolson Street, Edinburgh, 8.

MUSIC.

B. G.

Age. 16 (for professional training). 18 (for teacher training).

Qualifications. O, preferably A for teacher training.

Pay. As a teacher in State system—in accordance with Burnham scales. Otherwise—very varied.

Aptitudes. Natural talent and strong constitution.

Method of Entry. Acceptance by a school of music or University.

Further Training. 3–6 years at school of music, leading to a diploma or degree.

The person who studies music with a view to making a career has two courses open. He or she can study to become a professional performer or a teacher. In the former case it must be realised that competition is very great, and only those who are at the top of their "class" and able to stay there can hope for the "glamorous" solo work. There has been recently, however, an increased public demand for music, and prospects of getting an orchestral post are perhaps slightly better for the good performer than they were in the past. This growth (or revival) of interest in music in this country means that there is also more for the trained teacher to do.

The boy or girl who wishes to take up music professionally must be proficient enough to pass an entrance examination if he or she wishes to follow a full-time School of Music course. The addresses of the best known of these schools are given below.

These courses cater for both would-be performers and teachers, and for the latter there is the alternative of a University course leading to a degree in music. These degrees are offered by the Universities of Birmingham, Bristol, Cambridge, Dublin, Durham, Edinburgh, London, Manchester, Oxford, Sheffield, Wales and the National University of Ireland.

The profession of music is in many respects more of a vocation than a career, and only those who have a real determination to devote their lives to this branch of the arts and sufficient character to withstand the boredom of repeated rehearsals, and the often straitened circumstances of a musician's life, should embark on such a hazardous undertaking.

Addresses.

The Royal Academy of Music, Marylebone Road, N.W.1.

The Royal College of Music, Prince Consort Road, South Kensington, S.W.7.

The Guildhall School of Music and Drama, John Carpenter Street, E.C.4.

The Birmingham School of Music, Paradise Street, Birmingham, 1.

Trinity College of Music, Mandeville Place, Manchester Square, W.1.

The Royal Manchester College of Music, Ducie Street, Oxford Road, Manchester.

The London College of Music, Great Marlborough Street, W.1.

The Scottish Academy of Music, St. George's Place, Glasgow, C.2.

Book.

To be a Professional Musician (Methuen), 10*s.* 6*d.*

NURSING.

Usually G, but B, much in demand.

Age. 18–30 (for beginning of training).

Qualifications. Preferably O, but not essential, though increasingly A is required.

Pay. £440–£557 (for Staff Nurse).

Aptitudes. Interest in people, good health, even temper, tact.

Method of Entry. By application to Matron of approved hospital.

Further Training. At least 3 years until State Registration.

Nursing nowadays is a profession which appeals to many young women who wish to make a career in the service of others. Training for State Registration (S.R.N.) cannot begin until the age of 18, and girls who leave school at 15 are often at a loss as to what to do with the intervening 3 years. Those who have the opportunity of staying in a Sixth Form are well advised to do so, as Sixth Form work is a useful preparation for the further study the student must tackle.

There are the alternatives of the pre-nursing courses which are run by some schools and tech-

nical colleges, and the cadet schemes which are run by some hospitals.

Training (which is resident) lasts for 3–4 years (except for Fever Nursing, which is a 2-year course). Registration may be obtained in: (i) General Nursing; (ii) The Nursing of Sick Children; (iii) Fever Nursing; (iv) Mental Nursing; (v) The Nursing of Mental Defectives. It is considered advisable to qualify in General Nursing as a basic training, whichever branch is taken up later.

There is an alternative 1-year course run on simpler lines for girls who feel they cannot cope with the considerable amount of study involved in the S.R.N. course. This leads to the qualification of State Enrolled Assistant Nurse. The salary scale for the S.E.A.N. is slightly lower than the one indicated above.

There are no fees incurred during training, and indeed, an allowance is made in addition to full board and lodging.

The qualified nurse has many interesting openings available to her. Apart from the different branches of hospital work, there are: District Nursing, Midwifery, Private Nursing, Public Health Nursing (all of which allow the nurse a more independent and less communal life), the Nursing Services of the Crown, the Overseas Nursing Service, and the various Missionary Societies.

Male Nurses. These are nowadays quite often trained and employed under similar conditions. They work usually in the larger hospitals, and almost always live out (except in the case of Mental Hospitals). There are good prospects, particularly for Male Nurses, as "Sister Tutors," when both teaching and nursing qualifications are combined.

Address.

Nursing Recruitment Service, 21 Cavendish Square, W.1.

OCCUPATIONAL THERAPY.

B. G.

Age. 18+.

Qualifications. O.

Pay. About £500–£850+.

Aptitudes. Interest in people, initiative, tact, practical and/or artistic ability.

Method of Entry. Acceptance for course by approved Training School.

Further Training. Usually 3 years leading to the Diploma of the Association of Occupational Therapy.

The Occupational Therapist is concerned with helping the patient to recover and regain his self-confidence by guiding him into a suitable form of work, activity, or recreation. The therapy is therefore partly psychological and partly physical, and the therapist is the person who sees that the doctor's wishes in this respect are carried out and who can prescribe the necessary activities and encourage the patient to co-operate.

During training the student works for part of the time in a hospital learning how to become a member of the team concerned with the recovery of the patient. He or she also studies Anatomy, Physiology, Psychology, Medicine and Surgery, Psychiatry, and the Theory of Occupational Therapy, as well as a series of remedial techniques.

A list of the approved training schools can be had from the address below. Fees are payable, but maintenance and other grants are often available from the Local Education Authority, subject to the usual conditions.

Address.

The Association of Occupational Therapists, 251 Brompton Road, S.W.3.

Pamphlets.

Choice of Careers Series, No. 53 (H.M.S.O.), 6*d.*

Occupational Therapy. Available from the Association.

OPHTHALMIC OPTICIAN.

B. G.

Age. 16+.

Qualifications. A.

Pay. On qualification:—

1. £575–£875 minimum scale in Hospital Eye Service.
2. In Private Practice by arrangement.

Aptitudes. Neatness, manual dexterity, interest in people, attention to detail.

Method of Entry. Acceptance by Training College (usually a CAT) for full-time course.

Further Training. 3-year Training Course followed by 1 year of practical work with a qualified optician.

The Ophthalmic Optician, who must not be confused with the Dispensing Optician (see below), is the person who is responsible for the examination of eyes and the prescription of spectacles, contact lenses, etc. After the 3 years' course the student has to spend a year gaining clinical experience with an established optician or in a hospital. During this final year the student may expect between £350 and £400 salary, whether he chooses to work in a hospital or with an optician. He or she is then entitled to practise in the National Health Service, and can follow one of two courses:—

1. Join the Hospital Eye Service (which carries a progressive salary and pension rights).
2. Enter an established practice with the idea of later going into partnership or working alone.

Note: The **Dispensing Optician** is the person concerned with the dispensing of the lenses prescribed by the Ophthalmic Optician. From the age of 16 the student can be trained either by following a full-time course for 2 years at an approved centre or by working under an approved optician and supplementing the practical work by part-time study for the examinations of the Association of Dispensing Opticians. The latter method takes about 4 years.

Addresses.

The Association of Optical Practitioners, Dept. 11, 65 Brook Street, W.1.

The Association of Dispensing Opticians, 50 Nottingham Place, W.1.

Pamphlets.

Choice of Careers Series, No. 74 (H.M.S.O.), 9*d.*

The Optical Profession. Available from the Association of Optical Practitioners.

ORTHOPTICS.

B. G.

Age. 17+.

Qualifications. O, but preferably A.

Pay. £405 p.a.–£480 p.a. (minimum scale).

Aptitudes. Patience, liking for people, especially children.

Method of Entry. Acceptance on a course at an approved hospital.

Further Training. 2 years' full-time training leading to the Diploma of the British Orthoptic Board.

The orthoptist is concerned with remedial work with patients (very often children) who suffer from squints and "lazy" eyes. She (for it is usually girls who take up this career) may work in an eye hospital, a children's hospital, a general hospital with an ophthalmic department, or a school clinic. There are also some opportunities with ophthalmic surgeons in private practice.

Those who become interested in teaching may take a course after at least 2 years' experience in order to qualify. The teaching side commands rather higher salaries. There are fourteen Orthoptic Training Schools attached to hospitals throughout the country, and a list of these and full details can be obtained from the address below.

Address.

The Faculty of Ophthalmologists, 45 Lincoln's Inn Fields, W.C.2.

Pamphlets.

Choice of Careers Series, No. 69 (H.M.S.O.), 6*d*.

Orthoptics. Available from British Optical Board, Tavistock House, Tavistock Square, W.C.1.

PERSONNEL MANAGEMENT.

B. G.

Age. 21+.

Qualifications. Usually at least A; preferably a degree.

Pay.

Men: about £600+ as an assistant, rising to £1,200 or more, depending on ability, etc.

Women: rates tend to be £100–£150 lower than men's for equivalent work.

Aptitudes. Patience, tact, persuasiveness, ability to get on with people.

Method of Entry. By application for posts advertised in the national Press.

Further Training. See below.

The work of a personnel officer is varied, but is usually concerned with the recruitment of workers and staff for business and industrial organisations, training, conditions of employment, welfare, and consultation arrangements between management and employees.

Probably the best method of gaining the necessary training to embark on this career is to take a degree or diploma in social science and to follow this up with a 1-year course in Personnel Management. The subjects covered in this post-graduate course are Economics, Economic History, Social Administration, General and Industrial Psychology, Industrial Law, Industrial Relations, Principles and Practice of Personnel Management, and Business Administration.

Alternative part-time courses are available at many Technical Colleges, and these occupy 2–3 evenings a week for a period of 5 years in preparation for the Diploma in Management Studies. Correspondence courses are also available. Full details can be obtained from the first address below.

Addresses.

The British Institute of Management, Management House, 80 Fetter Lane, E.C.4.

The Institute of Personnel Management, Management House, 80 Fetter Lane, E.C.4.

Pamphlets.

Training for Personnel Management (Institute of Personnel Management).

Careers for Men and Women, No. 35 (H.M.S.O.), 6*d*.

PHARMACY.

B. G.

Age. There is no age limit for entry.

Qualifications. O, preferably A.

Pay. Varied, depending on nature of post obtained on qualification (see below).

Aptitudes. Interest in science, capacity for detail.

Method of Entry. Registration with the Pharmaceutical Society as a student and acceptance by a School of Pharmacy.

Further Training.

1. 3 years' full-time study for Pharmaceutical Chemist's Diploma, followed by 1 year's practical training in a pharmacy, a hospital, or a manufacturing laboratory.
2. Degree in Pharmacy followed by 1 year's practical training as above.

Pharmacy is the branch of medical work concerned with the dispensing of medicines and appliances. There are three main branches of the profession, namely retail, hospital, and manufacturing. The majority of vacancies occur on the *Retail* side, and the normal procedure is for the newly qualified person to secure employment as an assistant to an established pharmacist, with the intention of eventually taking a partnership, starting alone, or obtaining a managerial post in one of the large retail concerns. *Hospital Pharmacy* work is growing in scope, but at the moment positions are rather hard to obtain as they are limited in number. *Pharmaceutical Manufacturing* provides many openings, often with the opportunity for research and travel.

It should be noted that there is nothing to stop a qualified young person gaining experience in more than one of these branches, as experience gained in one type of work is of undoubted value in the others.

Address.

The Pharmaceutical Society of Great Britain, 17 Bloomsbury Square, W.C.1.

Pamphlet.

Choice of Careers Series, No. 62 (H.M.S.O.), 9*d*.

PHOTOGRAPHY.

B. G.

Age. Usually 16.

Qualifications. Preferably O.

Pay.

1. In commercial work, about £425 p.a. after training.
2. In National Health Service, about £440–£760 p.a. (Whitley Council Scale).

Aptitudes. Patience, neatness.

Method of Entry.

1. Apprenticeship.
2. Acceptance on full-time course at School of Photography.
3. Securing of employment as junior assistant to photographer.

Further Training.

1. 4-year apprenticeship, combined with part-time study for the exams of the Institute of British Photographers.
2. 3 years' full-time study at Art School or School of Photography.
3. As a junior assistant, part-time study for the examination of the Institute of British Photographers or the City and Guilds of London Institute.

Photography as a career has many branches of which the following are the main ones: Portraiture, Advertising, Press, Medical, Scientific.

All these branches demand skilled work, not only in the taking of pictures but on the process-

ing side. Some, such as the Scientific or Press branches, require special aptitudes or training. Indeed, the amount of background knowledge of science needed to make a top rate Scientific Photographer is often of degree order.

Those who choose to acquire their training by apprenticeship or while working as a junior assistant must guard against the danger of getting too one-sided a practical experience while training. For an apprenticeship, this can generally be avoided by careful choice of a firm which deals with varied work, but it presents a real problem for the ordinary assistant attempting to study in his or her spare time. Even for those who wish to follow full-time courses, there is considerable difficulty in finding vacancies, as there are too few schools for the number wishing to train. Early application is therefore essential.

A full list of the Colleges providing full-time courses can be obtained from the Institute at the address below.

Address.

The Institute of British Photographers, 49 Gordon Square, W.C.1.

PHYSIOTHERAPY.

B. G.

Age. 18+.

Qualifications. O.

Pay. £480 p.a. starting salary when trained. Possibility of rising to £875 p.a.

Aptitudes. Physical fitness, tact, liking for people.

Method of Entry. Acceptance for training by a school recognised by the Chartered Society of Physiotherapy.

Further Training. 3 years' full-time training at a school as above, studying for the examinations of the Society.

The physiotherapist is the person who assists the doctor to hasten the recovery of patients suffering from many types of injury or illness by using physical means. Thus massage, electrotherapy, and exercises prescribed by a doctor all come within the scope of the physiotherapist. It is obvious, therefore, that the trained person must be fully grounded in physiological matters, as well as the potentialities of the aids which are now available. It is because of the necessary thoroughness of training that the course lasts 3 years.

Surprisingly enough for work of such social importance, training has to be paid for (unlike Nursing). There is, however, the possibility of financial assistance from Local Education Authorities, and the Society itself offers some small bursaries.

As is so often the case where work involving service to others is concerned, salaries are not particularly high, but the young man or woman who takes up physiotherapy as a career has at least the satisfaction of knowing that the work he or she is doing is of increasing social importance.

A detailed list of training establishments is available from the Society at the address below.

Address.

The Chartered Society of Physiotherapy, Tavistock House (South), Tavistock Square, W.C.1.

Pamphlet.

Choice of Careers Series, No. 52 (H.M.S.O.), 1*s.*

Physiotherapy, a career with a future. Available from the Society.

POLICE.

B. G.

Age.

Men, 19–30 (18 for Metropolitan Police).
Cadets, 16.
Women, 20–35 (20–30 in Scotland).

Qualifications. For Cadets: usually O.

Pay.

1. Men, £510–£695 after nine years.
2. Women, £460–£625 after nine years.

(These are Constables' rates only and are somewhat higher in the London area.)

Aptitudes. Good health, patience, team spirit, ability to pass simple entrance test.

Note. There are certain physical requirements:—

Men must be at least 5 ft. 8 in. tall (in some forces taller).
Women must be at least 5 ft. 4 in. tall.
Sight must be normal without glasses.

Method of Entry. By application to the local Police Station or the Chief Constable or Senior Officer of the local Police Force.

Further Training. 3 months' basic training, followed by practical training for about 2 years.

The fundamental purpose of the police is the maintenance of law and order, but there are many other ways in which they are of service to the community—from the relief of traffic congestion to the simple help and guidance of the general public.

There are 125 Police Forces in England and Wales, and thirty-three in Scotland, and they vary greatly in size and make-up. The largest and most complex are those in the large towns, and it is in these forces that the ambitious boy or girl will probably be most interested.

Specialist police work is done by the following branches: C.I.D., finger-prints and photography, motor patrol, wireless duties, river police work, registration of aliens. These departments draw on the ordinary constabulary for their recruits, and young people with special aptitudes have a good chance of being selected.

For the first 2 years new entrants are on probation, and during this time they have several courses and examinations. Promotion thereafter to the ranks of Sergeant and Inspector is by service and examination subject to vacancies being available. There is a contributory superannuation fund, and an officer may retire after 25 years' service on half the average pay of the last 3 years of service. Welfare and sports facilities are usually very good. One important thing to note is that the pay rates quoted (which are the minimum) do not show the "hidden income" of rent-free accommodation or allowance in lieu.

Those boys who have definitely decided on the police as a career (or who wish to find out for themselves what it is all about), but who are not old enough to join, can join the Police Cadets attached to certain police forces.

Addresses.

The Police Recruiting Department, Home Office, Whitehall, S.W.1.

The Police Recruiting Department, Scottish Home Department, 18 Rothesay Terrace, Edinburgh, 3.

Pamphlets.

Choice of Careers Series, No. 80 (H.M.S.O.), 1*s.* 9*d.*

Your Career: Life in the Police. Available from the Home Office.

PRINTING.

B.

Age. 15.

Qualifications. It is said to be useful if the candidate for an apprenticeship has a relation in the firm which he wishes to join.

Pay. Basic minimum over £11 per week on completion of training. Real wages often considerably higher.

Aptitudes. Intelligence, good eyesight, neatness, attention to detail.

Method of Entry. Acceptance of candidature for apprenticeship by Local Apprenticeship Committee.

Further Training. 6 years' apprenticeship coupled with day part-time release and evening study at a Technical College.

Printing is a skilled occupation, and the term covers the activities of compositors, machine managers, photo-process workers, stereotypers, electrotypers, etc. It is also one of the most highly remunerated manual industries, and there is considerable competition for the available apprenticeships. It is therefore helpful to have the agreement of a master printer to accept the would-be apprentice when applying to the Local Apprenticeship Committee.

Some schools also run full-time courses for those interested in the ancillary aspects of printing, such as costing, estimating, paper, and administration, as well as the practical operative work. Such courses last from 2 to 3 years.

Printing enjoys one of the highest degrees of security as an individual career, and does not suffer from the recessions which periodically hit other industries.

Full details of this career can be obtained from the second address below.

Addresses.

The British Federation of Master Printers, 11 Bedford Row, W.C.1.

The Joint Industrial Council of the Printing and Allied Trades, 11 Bedford Row, W.C.1; *or* 60 Doughty Street, W.C.1.

Pamphlet.

Choice of Careers Series, No. 45 (H.M.S.O.), 1*s.* 9*d.*

RADIOGRAPHY AND RADIOTHERAPY.

B. G.

Age. 18.

Qualifications. At least O.

Pay. About £450–£800, depending on experience and status.

Aptitudes. Interest in people, tact.

Method of Entry. Acceptance by training hospital recognised by Society of Radiographers.

Further Training. 2 years' full-time study at a training hospital leading to the Diploma Examination of the Society of Radiographers.

Radiography is the taking of X-ray photographs, and Radiotherapy is the treatment of disease by X-ray and radium techniques. The training for both branches is the same during the first year, but thereafter those who are going in for Radiotherapy follow a different course. The radiographer is a member of one of the important teams of doctors, nurses, therapists, and almoners who are essential to the efficient running of the hospital service. At the moment the majority of workers in Radiography and Radiotherapy are women, but there is no reason why young men with an interest in this type of work should not make a satisfying career, especially as radiography services are expanding.

A list of the hospitals offering courses can be obtained from the Society at the address below.

Address.

The Society of Radiographers, 32 Welbeck Street, W.1.

Pamphlets.

Choice of Careers Series, No. 41 (H.M.S.O.), 9*d.*

SECRETARIAL WORK.

G.

Age. 15+.

Qualifications. Preferably O.

Pay. £8–£12 per week as experienced secretary.

Aptitudes. Tact, discretion, ability to reach a high standard of shorthand and typing, and good memory.

Method of Entry. By application for advertised posts.

Further Training. If not qualified before entry, part-time study for shorthand and typing qualifications.

Secretarial work, for which there is an ever-increasing demand, offers an interesting and often well-paid career to a reliable and intelligent girl. The best way of acquiring training is a full-time course at a private secretarial school, preferably after having reached a good educational standard (O or A) at school. Alternatively, some schools include shorthand and typing in the curriculum (especially Secondary Commercial and Secondary Technical Schools), leading usually to the examinations of the Royal Society of Arts or the London Chamber of Commerce. For those who leave school with no experience of shorthand and typing and who wish to train in their spare time while working, perhaps at a junior clerical job, the Technical Colleges and Colleges of Further Education offer courses leading to the examinations of the Royal Society of Arts.

It should be pointed out, however, that pressure on these part-time classes is very great, and early enrolment at the beginning of the academic year is essential.

Many Colleges of Further Education also run courses in conjunction with the Office Management Association for the Certificates in Office Supervision, Office Methods, and Office Administration, which are useful for girls seeking supervisory posts.

Women graduates (usually with language qualifications) who take a secretarial course on completion of their degree can look forward to very interesting careers, often involving travel and increasing responsibility as they gain experience.

Many of the private colleges which run, in some cases, residential courses, have their own Appointments Bureaux and assist girls who qualify on their courses to find posts.

Mention should also be made of the Stenotyping courses available at the Palantype College in London and at other colleges and schools in the provinces. Stenotyping is a type of machine shorthand which has the advantage of legibility, speed, and absence of fatigue.

The following are the main private organisations offering secretarial and allied courses, and a list of the colleges run by them throughout the country can be had on request. Enquiries about Local Education Authority facilities should be made to the Education Officer of the authority concerned.

Addresses.

Pitman's College, 154 Southampton Row, W.C.1.

The Gregg Schools, Ltd., Gregg House, Russell Square, W.C.1.

Clark's College, 126 Chancery Lane, W.C.2.

The Palantype College, 229/231 High Holborn, W.C.1.

SPEECH THERAPY.

B. G.

Age. 18.

Qualifications. A.

Pay. £455–£815 p.a.

Aptitudes. Self-confidence, ability to speak well, liking for people.

Method of Entry. Acceptance by approved training school.

Further Training. 3 years' full-time training for the Diploma of the College of Speech Therapists.

Speech Therapists are usually girls, but there is no reason why boys who are interested in people and who satisfy the other preliminary requirements should not make a rewarding career in speech therapy, even though the financial return is unexciting.

The work involves the remedial treatment of speech defects, especially in children, at school, clinics, and in hospitals. There is also a considerable amount of part-time work available, payment for which is on a sessional basis.

One can practise only if one is a Licentiate of the College of Speech Therapists, and there are seven training schools recognised by this body, namely:—

1. The Central School of Speech Training and Dramatic Art, The Embassy Theatre, Swiss Cottage, N.W.3.
2. The Kingdom-Ward School of Speech Therapy, 26 Lower Sloane Street, S.W.1.
3. The Speech Therapy Training School of the West End Hospital for Nervous Diseases, 26 Holland Park, W.11.
4. The Oldrey Fleming School of Speech Therapy, 16 Harley Street, W.1.
5. The Leicester School of Speech Therapy, Adult Education Centre, Pelham House, 100 Welford Road, Leicester.
6. The Edinburgh School of Speech Therapy, 7 Buccleuch Place, Edinburgh, 8.
7. The Glasgow School of Speech Therapy, 25 Athole Gardens, Glasgow, W.2.

Address.

The College of Speech Therapists, 68 Queen's Gardens, W.2.

Pamphlet.

Choice of Careers Series, No. 51 (H.M.S.O.), 6*d*.

Speech Therapy as a Career. Available from the College.

SURVEYING.

B. G.

Age. 16+.

Qualifications. O.

Pay. Depending on branch, but roughly in region of £600–£1,300 p.a. on qualification.

Aptitudes. Capacity for detail, methodical mind, ability to calculate quickly and accurately.

Method of Entry. In general:—

1. As a junior assistant or under articles in an approved Surveyor's office.
2. Acceptance by approved training school for full-time course.
3. As a graduate holding B.A., or B.Sc. (Estate Management).

Further Training.

1. If entering as junior assistant or under articles: at least 4 years' part-time study leading to the Final Examination of the Royal Institution of Chartered Surveyors.
2. Full-time study for the First and Intermediate examinations of the Royal Institute, followed by 2 years' practical work and then the Final Examination.
3. If entering as a graduate, 2 years' practical work.

All the above methods lead to membership of the Royal Institute.

Surveying is a profession with many specialised aspects. The various branches are: Building Surveying, Housing Management, Land Agency, Land and Hydrographic Surveying, Mining Surveying, Quantity Surveying, Town and Country Planning, Valuation.

Building Surveying is concerned with the supervision of building, building repairs, and the specifications for builders' work of all descriptions.

Housing Management is more specifically the development and management of housing estates.

Land Agency involves the management of country estates, and agricultural improvements valuations.

Land and Hydrographic Surveying is concerned with measuring and drawing the shape of the land, and mapping the rivers, lakes, and seas. Surveyors in this category are usually government servants.

Mining Surveying is concerned with underground surveys and preparing plans for workings. Surveyors are usually employed by the National Coal Board, but have great scope for work overseas.

Quantity Surveying is concerned with drawing up the estimates of materials and labour required in accordance with the architect's plans. The Quantity Surveyor is also concerned with the valuation of work executed.

Town and Country Planning deals with the preparation and development of planning schemes and involves the surveying of resources and needs of a particular area. Further study to gain the Diploma of the Town Planning Institute is advisable for this branch of the career.

Valuation. The Valuation Surveyor either works for the Inland Revenue and is employed to value real property for the Crown in connection with death duties, income tax, etc., or is in private practice and carries on similar work on behalf of private individuals.

The newcomer to this profession will have decided which branch of surveying he or she wishes to take up. Except for Mining and Land Surveying, all branches have a common syllabus for the First Examination of the Royal Institution of Chartered Surveyors, but thereafter the Intermediate and Final Examinations are on work appropriate to the specialisation being followed. The requirements of the other professional bodies vary in detail, and full information may be had from the addresses below.

There is at present a shortage of qualified surveyors in the country, partly because many surveyors obtain lucrative employment overseas, and the prospects for energetic ambitious young people are excellent.

Addresses.

The Royal Institution of Chartered Surveyors, 12 Great George Street, Westminster, S.W.1.

The Institute of Quantity Surveyors, 98 Gloucester Place, W.1.

The Incorporated Association of Architects and Surveyors, 75 Eaton Place, Belgrave Square, S.W.1.

Pamphlet.

Choice of Careers Series, No. 87 (H.M.S.O.), 1*s*. 9*d*.

TEACHING (England and Wales).

B. G.

Age. 18+.

Qualifications. O, usually A.

Pay. Depending on qualifications, status, and experience, but within range £520 p.a. to about £1,750 p.a. (in State service).

Women will receive equal pay by spring, 1961.

Aptitudes. Patience, interest in the young, sense of humour, good health.

Method of Entry (State system).

1. Acceptance by Training College.
2. As a graduate followed usually but not necessarily by acceptance by University Department of Education.

Note. At the moment it is not essential for a graduate (or person holding certain other qualifications in, *e.g.*, art, music) to hold a Diploma in Education of a University Department of Education, but in a few years' time this may be essential for new entrants.

Further Training.

1. If accepted by Training College, 3 years' full-time training. This can sometimes be combined with study for an external Degree (General or unclassified Honours).
2. The Diploma in Education course offered by University departments of Education, which lasts for 1 year.

The majority of posts in teaching are available in schools run by the Local Education Authorities or assisted by them. These fail into three main categories: Primary, Secondary, and Further Education.

The Primary System is made up mainly of Infant Schools (5–7 years) and Junior Schools (7–11). Teaching in Infants' and Junior Schools demands special qualities of patience and understanding, and it is usual for the Training College student to follow a slightly different programme of studies from those who are going to specialise in Secondary Teaching.

The Secondary System is being constantly modified by many Local Education Authorities, but basically there are two distinct patterns: (i) The Secondary Modern/Secondary Technical/Secondary Grammar organisation, and (ii) The Comprehensive System.

In the first of these children are sorted out at the age of 11 (or 13) according to their parents' wishes and their educational possibilities. Those who go to Grammar Schools need a more specialised and academic course, and it is to this type of school that most graduates are attracted. There are nevertheless many Modern Schools (which outnumber the Grammar by 4 or 5 to 1) offering courses leading to " O " and thus giving opportunities to graduates. Technical Schools (which sometimes recruit their children at 13+) offer as well opportunities to people qualified in industry and commerce who wish to enter the teaching profession.

The Comprehensive School aims at offering the facilities of the above three types under one roof, and is usually a large organisation affording opportunities to many different types of teacher.

The Further Education system comprises the CATs, the Technical Colleges, The Colleges of Further Education, Village Institutes, Evening Institutes, and is of interest to those who feel more drawn to work with young people and adults. Much of the very varied field of work in Further Education is done by part-time teachers and lecturers, but there are nevertheless many opportunities for full-time teaching.

Salaries and conditions of service are gradually improving in the teaching profession, and it is now an attractive career (especially for women with the advent of equal pay). There are still many vacancies in all types of schools, and especially for qualified teachers of science and mathematics.

The independent schools are more and more coming into line with the State schools as regards salary, etc., and often are able to offer added inducements, such as free or cheap accommodation.

There are no fees for courses at the Training Colleges, and help with maintenance is available for those who need it.

The educational system and methods of teacher training are different in Scotland and Northern Ireland, and details can be obtained from the appropriate addresses below.

Addresses.

The above available from the Ministry.

VETERINARY WORK.

B. G.

Age. 21+ (on qualification).

Qualifications. A (to start University course).

Pay.

1. In private practice as assistant, about £600.
2. In Government Service, £795–£1,280.

Aptitudes. Patience, capacity for detailed observation, fondness of animals.

Method of Entry. Acceptance on University course.

Further Training. 4–6 years' University Degree course.

Veterinary work is concerned with the maintenance of good health in animals and the cure of animal diseases—in other words, the " vet " is the animal doctor. The vet suffers from this disadvantage, however—that animals cannot speak about their symptoms. The young man or woman contemplating veterinary work as a career must, therefore, have a real understanding of and love for animals. This is what makes veterinary work a vocation rather than a career for many people.

In order to practise as a " vet " one must be a member of the Royal College of Veterinary Surgeons, and the necessary qualification for this is a University Veterinary Degree. Degree courses are offered by the following bodies:—

Royal Veterinary College and Hospital, Camden Town, N.W.1.

Royal (Dick) School of Veterinary Studies, Summerhall, University of Edinburgh, 9.

University of Glasgow Veterinary School.

Veterinary Schools of the Universities of Bristol, Cambridge, Liverpool.

Veterinary College of Ireland, Ballsbridge, Dublin, S.E.4.

For the qualified person, openings are available with the Ministry of Agriculture, Fisheries, and Food, and for men in the Army (where after 1 year's service one reaches the rank of Captain). The majority of newly qualified people take a post as an assistant to an established vet in order to gain the necessary practical experience.

Address.

The Royal College of Veterinary Surgeons, 9–10 Red Lion Square, W.C.1.

Pamphlet.

Careers for Men and Women, No. 43 (H.M.S.O.), 6*d*.

B.B.C. CAREERS PROGRAMMES.

The B.B.C. plan to broadcast the following programmes during 1960 and 1961:—

1. The *World of Work* series on sound radio during the autumn school term (1960) on Mondays from 11.30 to 11.40 a.m., covering such subjects as "choosing a job," "applying for a job," "what is a good job," etc.

2. *First Years at Work*, a television series, during the autumn and spring terms (1960–61) on Mondays from 2.05 to 2.30 p.m., repeated on Tuesdays from 11.05 to 11.30 a.m. Like (1), this programme will be of interest to pupils in secondary modern schools and will deal with individual careers or groups of careers.

3. The *Choosing a Job* series, details of which will appear in the *Radio Times*.

BOOKLETS.

Booklets in the series "Choice of Careers" are obtainable from H.M. Stationery Office at: York House, Kingsway, London, W.C.2; 423 Oxford Street, London, W.1; 13a Castle Street, Edinburgh, 2; 39 King Street, Manchester, 2; 2 Edmund Street, Birmingham, 3; 109 St. Mary Street, Cardiff; Tower Lane, Bristol, 1; 80 Chichester Street, Belfast; or through any bookseller.

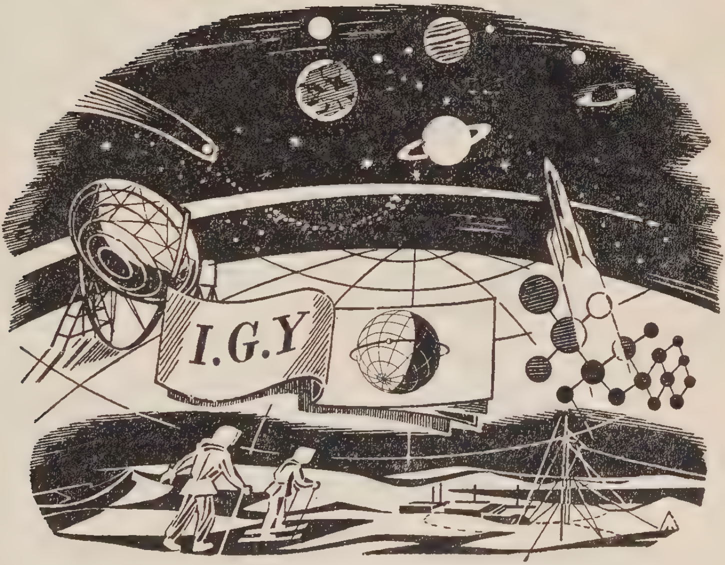
The World of Science



This section deals with everything from atoms to stars, from the simplest living things to the human mind in all its complexity. What could be more important or exciting?

TABLE OF CONTENTS

The World of Science

INTRODUCTION

At no time in our history has it been more necessary for the ordinary individual—and outside our own specialised knowledge we are all ordinary individuals—to know and understand what the scientists are doing; for we have now reached a state of affairs which may well prove to be the cross-roads of human destiny. The dramatic new developments have made it inevitable that all must live or all must die. On the one hand, there exists the possibility of undreamed-of abundance, peace, and happiness for an ever-increasing number of mankind, and on the other total annihilation, if not of the whole human species, at least of all that makes life worthwhile. Which way are we to choose?

In this choice ordinary people must play a major part, but this they cannot do without understanding the issues involved, since free choice must be based upon a certain minimum of knowledge, and this is the reason why *Pears Cyclopædia* decided to include a section dealing with scientific progress.

The section is divided into two parts, the first (I., II., and III.) setting out to give a very brief account of the universe as seen by modern science and forming a background to the second part (IV.), which will discuss some of the more recent developments and discoveries. It need hardly be said that such a section must be sketchy in the extreme, and that only a very few of the main issues can be discussed. But the writer of this section believes with the Editor that it is worth while trying. We are frequently reminded by the learned that modern knowledge increases so rapidly that no single mind can come anywhere near achieving the sort of universal knowledge which was possible, say, in the eighteenth century—and obviously this is quite true. But all this vast body of knowledge is not essential to most of us, who ask only two things from science: (1) that it should give us a *general* picture of the universe which will give us some idea of where we stand in relation to it; (2) that it should give us *particular* information concerning practical issues which concern us in everyday life. To describe modern knowledge from this point of view is certainly possible, although whether the present attempt succeeds in doing so the reader must decide for himself.

I. THE STRUCTURE AND ORIGIN OF THE UNIVERSE

The universe includes everything from the smallest sub-atomic particle to the mightiest system of stars. The scientific view of the universe (not the only view but the one we are concerned with here) is a remarkable achievement of the human mind, and it is worth considering at the outset what a "scientific view" is, and what is remarkable about it.

A scientific view of something is always an intimate mixture of theories and observed facts, and not an inert mixture but a seething and growing one. The theories are broad general ideas together with arguments based on them. The arguments are designed to show that, if the general ideas are accepted, then this, that, or the other thing ought to be observed. If this, that, or the other actually are observed, then the theory is a good one; if not, then the theoreticians have to think again. Thus theoretical ideas and arguments are continually subjected to the severe test of comparison with the facts, and scientists are proud of the rigour with which this is done. On the other hand, theories often suggest new things to look for, *i.e.*, theories lead to predictions. These predictions are frequently successful, and scientists are entitled to be proud of that too. But it follows that no theory is immutable; any scientific view of any subject may, in principle, be invalidated at any time by the discovery of new facts, though some theories are so soundly based that overthrow does not seem imminent.

A remarkable aspect of the scientific view of the universe is that same principles are supposed to operate throughout the whole vastness of space. Thus the matter and radiation in stars are not different from the matter and radiation on earth, and their laws of behaviour are the same. Therefore theories hard won by studies in terrestrial physics and chemistry laboratories are applied at once to the whole cosmos. Astronomy and cosmology are spectacular extensions of ordinary mechanics and physics.

LOOKING AT THE UNIVERSE.

The universe is observable because signals from it reach us and some manage to penetrate our atmosphere.

First, there are waves of visible light together with invisible rays of somewhat longer (infra-red) and somewhat shorter (ultra-violet) wavelengths. These waves show us the bright astronomical objects and, to make use of them, astronomers have constructed telescopes of great power and precision backed up with cameras, spectroscopes, and numerous auxiliaries. The most powerful telescope, at Mt. Palomar, California, has a 200-in.-diameter mirror. The next major advance in optical telescope performance probably awaits the erection of telescopes on satellites outside the earth's atmosphere, which at present acts as a distorting and only partially transparent curtain.

Secondly, there are radio waves of much longer wavelength than light. These can be detected by sensitive radio receivers with special aerial systems. These are the radio telescopes (**X18** (2)). The most well known is at Jodrell Bank and started working in 1957. A larger and more sensitive one is being built in West Virginia, U.S.A.

A third type of radiation from outer space impinges on the atmosphere. This is the cosmic radiation. It consists of very fast-moving fundamental particles, including protons (**F13**). Cosmic rays are detected by Geiger counters, by the minute tracks they leave on photographic plates, and by other means. The origin of cosmic rays is still uncertain, but many people think they must have an intimate connection with the nature and evolution of the universe itself.

By looking at, and listening to, the universe with optical and radio telescopes, astronomers have formed a remarkably detailed picture of its structure. The merest outline of this will now be given.

Great Distances and Large Numbers.—Let us start with nearby objects. This raises at once the question of what "nearness" and "distance" are in astronomy and how they are to be expressed. A convenient unit of distance is the *light-year*, *i.e.*, the distance that light, travelling at 186,000 miles per second, traverses in one year. Since vast numbers as well as vast distances will enter the question, we need a shorthand for large numbers. Ten times ten times ten will be represented by 10^3; six tens multiplied together (*i.e.*, one million) will be written 10^6, and so on. 10^{14} would mean a hundred million million. One divided by a million (*i.e.*, one-millionth) will be written 10^{-6};

the very small number obtained by dividing one by the product of fourteen tens will be written 10^{-14}. A light-year is $5{\cdot}88 \times 10^{12}$ miles: the radius of an atom is about 10^{-8} cm.

The Solar System.—The earth is the third, counting outwards, of nine planets revolving in nearly circular orbits round the sun. Their names and some other particulars are given in the table (**F7**). The sun and its planets are the main bodies of the solar system. Between Mars and Jupiter revolve numerous chunks of rock called the asteroids: the largest of these, Ceres, is 480 miles across. Apart from these, the solar system is tenuously populated with gas, dust, and small particles of stone and iron. Dust continuously settles on the earth, and frequently small fragments enter the atmosphere, glow, and evaporate; these are meteors or shooting stars. Sometimes larger rocks, called meteorites, hit the earth. Comets are relatively compact swarms of particles—containing ice according to one theory—which travel in elongated orbits round the sun. Their spectacular tails form under the sun's influence when they approach it. Not all comets stay indefinitely in the solar system; some visit us and go off into space for ever.

The sun itself is a dense, roughly spherical mass of glowing matter, 865,000 miles across. Its heat is so intense that the atoms are split into separated electrons and nuclei (*see* **F10**) and matter in such a state is called plasma. At the sun's centre the temperature has the unimaginable value of about 13 million degrees Centigrade (a coal fire is about 800° C.). Under such conditions the atomic nuclei frequently collide with one another at great speeds and reactions occur between them. The sun consists largely of hydrogen and, in the very hot plasma, the nuclei of hydrogen atoms interact by a series of reactions whose net result is to turn hydrogen into helium. This is a process which releases energy just as burning does, only these nuclear processes are incomparably more energetic than ordinary burning. In fact, the energy released is great enough to be the source of all the light and heat which the sun has been pouring into space for thousands of millions of years.

We may note in passing that the occurrence of these energy-producing reactions in sufficiently hot plasmas is the reason why so much effort is nowadays put into the study of plasma physics. The well-known Harwell machine, Zeta, is a device for producing and containing hot plasma. It is one of man's attempts to imitate on earth the energy-giving processes in the sun.

Stars.—In colour, brightness, age, and size the sun is typical of vast numbers of other stars. Only from the human point of view is there anything special about the sun—it is near enough to give us life. Even the possession of a system of revolving planets is not, according to some modern views, very unusual.

No star can radiate energy at the rate the sun does without undergoing internal changes in the course of time. Consequently stars evolve and old processes in them give rise to new. The exact nature of stellar evolution—so far as it is at present understood—would be too complex to describe here in any detail. It involves expansion and contraction, changes of temperature, changes of colour, and changes in chemical composition as the nuclear processes gradually generate new chemical elements by reactions such as the conversion of hydrogen to helium, helium to neon, neon to magnesium, and so on. The speed of evolution changes from time to time, but is in any case very slow compared with the pace of terrestrial life; nothing very dramatic may occur for hundreds of millions of years. Evidence for the various phases of evolution is therefore obtained by studying many stars, each at a different stage of its life. Thus astronomers recognise many types with charmingly descriptive names, such as blue giants, sub-giants, red and white dwarfs, supergiants.

The path of stellar evolution is marked by various explosive events. One of these, which occurs in sufficiently large stars, is an enormous explosion in which a substantial amount of the star is blown away into space in the form of high-speed streams of gas. For about a fortnight, such an exploding star will radiate energy 200 million times as fast as the sun. Japanese and Chinese (but not Western) astronomers recorded such an occurrence in A.D. 1054, and the exploding gases, now called the Crab nebula, can still be seen in powerful telescopes and form a cloud six or seven light-years across. While it lasts, the explosion shows up as an abnormally bright star and is called a *supernova*.

Groups of Stars.—It is not surprising that ancient peoples saw pictures in the sky. The constellations, however, are not physically connected groups of stars but just happen to be patterns visible from earth. A conspicuous exception to this is the Milky Way, which a telescope resolves into many millions of separate stars. If we could view the Milky Way from a vast distance and see it as a whole we should observe a rather flat wheel of stars with spiral arms something like the sparks of a rotating Catherine wheel. This system of stars is physically connected by gravitational forces and moves through space as a whole; it is called a *galaxy*.

The galaxy is about 10^5 light-years across and contains roughly 10^{11} stars. An inconspicuous one of these stars near the edge of the wheel is our sun; the prominent stars in our night sky are members of the galaxy that happen to be rather near us. Sirius, the brightest, is only 8·6 light-years away, a trivial distance, astronomically speaking.

The galaxy does not contain stars only, there are also clouds of gas and dust, particularly in the plane of the galaxy. Much of the gas is hydrogen, and its detection is difficult. However, gaseous hydrogen gives out radio waves with a wavelength of 21 cm. Radio telescopes are just the instruments to receive these, and workers in Holland, America, and Australia detected the gas clouds by this means. In 1952 they found that the hydrogen clouds lie in the spiral arms of the galaxy, and this is some of the strongest evidence for the spiral form.

Around the spiral arms, and forming part of the galaxy, are numerous globular clusters of stars. These are roughly spherical, abnormally densely packed, collections of stars with many thousands of members. Because of its form and density, a globular cluster may be assumed to have been formed in one process, not star by star. Thus all its stars are the same age. This is of great interest to astronomers, because they can study differences between stars of similar age but different sizes.

Galaxies.—One might be forgiven for assuming that such a vast system as the galaxy is in fact the universe; but this is not so. In the constellation of Andromeda is a famous object which, on close examination, turns out to be another galaxy of size and structure similar to our own. Its distance is given in the table (**F7**). The Milky Way, the Andromeda Nebula, and a few other smaller galaxies form a cluster of galaxies called the Local Group. Obviously it would not be so named except to distinguish it from other distinct groups, and it is indeed a fact that the universe is populated with *groups*, or *clusters*, of *galaxies*. A cluster may contain two or three galaxies, but some contain thousands. So far as the eye of the telescope and camera can see, there are clusters of galaxies.

On a photograph a galaxy is a nebulous blob without the hard outline that a single star produces. Such nebulæ were formerly thought to be inside the Milky Way, but, after controversy, it was established that many of them were separate distant galaxies. By about 1920 it was known that there were at least half a million galaxies, and with the advent of the 100-in. Mt. Wilson telescope this number rose to 10^8 and is being increased further by the 200-in. telescope which can see out to a distance of 7×10^9 light-years. Through the powerful telescopes the nearer galaxies reveal their inner structures. Photographs of galaxies are among the most beautiful and fascinating photographs ever taken, and readers who have never seen one should hasten to the nearest illustrated astronomy book. Among

the pictures are some showing pairs of remote galaxies in collision. Such occurrences are of particular interest because they appear to be very strong sources of radio waves detectable by radio telescopes.

The Expanding Universe.—Two discoveries about galaxies are of the utmost importance. One is that, by and large, clusters of galaxies are uniformly distributed through the universe. The other is that the distant galaxies are receding from us.

How is this known? Many readers may be familiar with the Doppler effect first discovered in 1842. Suppose a stationary body emits waves of any kind and we measure their wavelength, finding it to be L ins. Now suppose the body approaches us; the waves are thereby crowded together in the intervening space and the wavelength appears less than L; if the body recedes the wavelength appears greater than L. The Austrian physicist, J. Doppler (1803–53), discovered this behaviour in sound waves, and it explains the well-known change of pitch of a train whistle as it approaches and passes us. The same principle applies to the light. Every atom emits light of definite wavelengths which appear in a spectroscope as a series of coloured lines—a different series for each atom. If the atom is in a receding body all the lines have slightly longer wavelengths than usual, and the amount of the change depends uniquely on the speed. Longer wavelengths mean that the light is redder than usual, so that a light from a receding body shows what is called a "red shift." The speed of recession can be calculated from the amount of red shift.

It was the American astronomer, V. M. Slipher, who first showed (in 1914) that some galaxies emitted light with a red shift. In the 1920s and 1930s the famous astronomer E. Hubble (1889–1953) measured both the distances and red shift of many galaxies and proved what is now known as Hubble's Law. This states that the speed of recession of galaxies is proportional to their distance from us. This does not apply to our neighbours in the Local Group, we and they are keeping together. Hubble's Law has been tested and found to hold for the farthest detectable galaxies; they are about 7×10^9 light-years away and are receding with a speed $\frac{2}{5}$ of that of light.

Does this mean that the Local Group is the centre of the universe and that everything else is rushing away from us? No; Hubble's Law would appear just the same from any other cluster of galaxies. Imagine you are in a square on some fabulous chess board which is steadily doubling its size every hour; all other squares double their distances from you in an hour. Therefore the farther squares from you must travel faster than the nearer ones; in fact, Hubble's Law must be obeyed. But anyone standing in any other square would get the same impression.

This extraordinary behaviour of the universe is one of the most exciting discoveries of science. Let us envisage one possible implication. If the galaxies have always been receding, then in the past they must have been closer together. Following this to its conclusion, it seems that all the matter in the universe must have been packed densely together about 10^{10} years ago. Was this really so? The lack of any definite answer to this question is one of the things that makes cosmology so interesting.

THE ORIGIN OF THE UNIVERSE.

Errors of observation and interpretation occur of course. But there are many checks and repetitions made, so that, on the whole, the descriptive account of the universe would be generally agreed among astronomers. When it comes to inventing theoretical explanations, however, science is on less sure ground, and indeed the theory of the universe is an arena of controversy at present. In most other sciences experiments can be repeated and the same phenomena observed under differing but controlled conditions. This is very helpful. But, by definition, there is only one universe; one cannot repeat it or do experiments with it. On the other hand, it must be remembered that the light from distant galaxies has taken perhaps 10^9 years to reach us, so it tells us what the galaxies were like that number of years ago. Therefore we are not confined simply to describing the present state of the universe; by looking farther into space we are looking farther into the past as well. How, then, does the state of the universe vary with time?

Evolutionary Theories.—One answer to this can be obtained from Einstein's general theory of relativity. Some slight indication of what this theory is about is given on page **F14**, and its logical development is, of course, a matter for mathematical specialists. It turns out that, if we assume that matter is distributed uniformly throughout space (as observation strongly suggests), then the solutions of Einstein's equations show how the state of the universe may vary with time. Unfortunately there are many possible solutions corresponding to expanding, static, or contracting universes. As we have already seen, the actual universe is expanding, therefore the static and contracting solutions can be ruled out. There is still a multiplicity of expanding possibilities: some correspond to indefinite expansion from an initially very dense state, others to expansion followed by contraction to a dense state followed by expansion and so on repeatedly, *i.e.*, a *pulsating* universe. The "dense state" is presumably to be identified with the time when the receding galaxies were all concentrated near one another, possibly in some dense conglomeration of atoms. This initial state is thought by some to be the origin of the universe; they would say it has been expanding and evolving ever since. If the universe is pulsating, then sooner or later, gravitational attractions between galaxies will slow the observed recession down and turn it into a mutual approach and so back to the dense state. A straightforward application of the mathematics makes this dense state *infinitely* dense, and presumably something must happen before this inconceivable situation arises. For example, forces between atomic nuclei may play an important part and determine what the dense state (if any) is actually like.

Some evolving universe theory on these lines is the more popular one among cosmologists at present; it was originally propounded by the Dutchman, W. de Sitter, the Russian, A. Friedman, and the Belgian, G. Lemaitre, all in about 1920.

The Steady State Theory.—A rival theory has been advocated by Bondi, Gold, and Hoyle since 1948. They hold that the universe is not changing with time; there was no initial dense state and no pulsations; the universe always has been, and always will be, like it is now. This does not mean that no local changes can be observed—this would clearly be contrary to the facts. But it does mean that, on the large scale, the clusters of galaxies have a distribution which is uniform in space and unchanging in time. If the numbers of clusters of galaxies in a large volume of space were counted every few thousand million years the answer would always be the same.

At first sight this appears to contradict outright the observed expansion of the universe. For if the galaxies are receding from one another how can the number in a given volume remain constant? The situation is saved by a bold proposal. It is that matter, in the form of hydrogen atoms, is being *continuously created* throughout space. This gas accumulates in due course into new galaxies, so that as the old ones move apart the young ones appear to keep the numbers up. The necessary amount of continuous creation can be calculated and is equivalent to the appearance of one atom in an average-sized room every 20 million years. If this seems absurdly small, try calculating the rate of creation in tons per second in a sphere of radius 10^9 light-years.

The rate of creation is, however, much too small to have affected any of the laws of ordinary physics. The famous law of the conservation of matter ("matter can neither be created nor destroyed") is violated, but on such a small scale that physicists, it is said, should not complain. Nevertheless, some do complain and see in this

violation a strong point against the steady state theory.

The object of the steady state theory is to bring the universe completely within the scope of scientific laws. For, in principle, the continuous creation is a process which could be observed and checked against a definite proposed law for it. This is to be distinguished from a "dense initial state" of the universe which has to be postulated and not observed. At the time of writing no observational method of disproving either (or both) the "steady state" or "evolutionary" theory has been possible, but the next few years may alter this situation.

An Electric Theory.—On page **F11** will be found the statement that an atom is electrically neutral. If this were not quite true, nothing in physics would be affected, provided that the lack of neutrality was exceedingly slight. Suppose the proton charge exceeded the electron charge by 1 part in 10^{18}; then the hydrogen atom would be slightly positive electrically, but this would be undetectable in everyday physics. But cosmology is not everyday physics, and R. A. Lyttleton has recently pointed out that just such a small charge per atom would be sufficient, *on a galactic scale*, to cause the mutual repulsion of different parts of the universe by normal electric repulsive forces which always exist between similarly charged bodies. This leads to a new explanation of the expanding universe which is based on a theory, not of gravitation, but of electricity.

A valuable by-product of this view is that the electric fields caused in galaxies by the excess charge will, under suitable conditions, accelerate protons to very high velocities. This is a possible origin of cosmic rays, which consist largely of high-speed protons.

A triumph of this theory would be the actual detection in the laboratory of the difference between the charges on electrons and protons, but there has not been time yet for the experimental and theoretical suggestions of this theory to be followed up in full.

The Formation of Galaxies and Stars.—On any theory of the universe, some explanation has to be found for the existence of clusters of galaxies. In all theories galaxies condense out from dispersed masses of gas, principally hydrogen.

According to the evolutionary theory, the "initial dense state" consisted of very hot plasma in a state of overall expansion. The expanding plasma was both cooling and swirling about. The random swirling produces irregularities in the distribution of the hot gas—here it would be rather denser, there rather less dense. If a sufficiently large mass of denser gas happened to occur, then the gravitational attraction between its own particles would hold it together and maintain its permanent identity, even though the rest of the gas continued to swirl and expand. Such a large mass would gradually condense into fragments to become galaxies, the whole mass turning into a cluster of galaxies.

The steady state view is interestingly and significantly different, for, on this theory, galaxies have always been present, and the problem is one of finding how existing galaxies can generate new ones out of the hydrogen gas which is supposed to be continuously created everywhere. Moreover, this was to be done at just the right rate to maintain the galactic population density constant —otherwise it would not be a *steady state* theory.

Inside galaxies there is an average density of the order of 10 or 20 hydrogen atoms per cubic inch; between galaxies, the density is 10^5 times less. Consequently we can imagine the relatively dense galaxy attracting the surrounding gas towards it by gravitation. If the galaxy were stationary the gas would presumably form an accretion to the galaxy. But imagine the galaxy to be moving through inter-galactic space. Then the combined effect of gravitation and motion is to create a region of increased gas density in the wake of the galaxy. This concentration in the wake becomes sufficiently large and dense to condense itself, by its own gravitational attraction, into a new galaxy. The offspring may either stay near the parent, forming an embryonic cluster of galaxies, or separate. In either case the process is repetitive and leads to the required stability in the number of galactic clusters.

Once a huge gas cloud becomes sufficiently condensed to be separately identifiable as a galaxy, further condensation goes on inside it. It is believed on theoretical grounds that it could not condense into one enormous star but must form many fragments which shrink separately into clusters of stars. In these clusters many stars, perhaps hundreds or thousands or even millions, are born at once. A small cluster, visible to the naked eye, is the Pleaides. The Orion nebula, visible as a hazy blob of glowing gas in the sword of Orion, is the scene of much star-forming activity at present.

The Formation of the Chemical Elements.—A stable nucleus is one that lasts indefinitely because it is not radioactive. There are 284 known kinds of stable atomic nuclei and little likelihood of any more being found. These nuclei are the isotopes (*see* **F10**) of 83 different chemical elements; the other elements, including, for example, uranium and radium are always radioactive. Some elements are rare, others abundant. The most common ones on earth are oxygen, silicon, aluminium, and iron. However, the earth is rather atypical. It is especially deficient in hydrogen, because the gravitational attraction of our small planet was not strong enough to prevent this very light gas from escaping into space.

It is possible to examine the chemical constituents of meteorites and to infer the composition of the sun and other stars from the spectrum of the light they emit. By such means, the conclusion has been reached that 93% of the atoms in our galaxy are hydrogen, 7% are helium; all the other elements together account for about one in a thousand atoms. A glance at the Table of Elements on page **N30** will show that hydrogen and helium are two of the lightest elements; they are in fact the two simplest.

According to the steady state theory, hydrogen atoms are constantly being created. The evolutionary theory supposes that the dense initial state was a system of very hot protons and electrons, *i.e.*, split-up hydrogen atoms. In either case, therefore, the problem is to explain how the heavier chemical elements appear in the universe at all. It is here that a fascinating combination of astronomy and nuclear physics is required.

We have already referred to the fact that the energy radiated from the sun originates in nuclear reactions which turn hydrogen into helium. Why is energy given out? To answer this question we note that nuclei are made up of protons and neutrons (*see* **F10**). These particles attract one another strongly—that is why a nucleus holds together. To separate the particles, energy would have to be supplied to overcome the attractive forces. This amount of energy is called *binding energy* and is a definite quantity for every kind of nucleus. Conversely, when the particles are brought together to form a nucleus the binding energy is *released* in the form of radiations and heat. Different nuclei consist of different numbers of particles, therefore the relevant quantity to consider is the *binding energy per particle*. Let us call this B. Then if elements of *high* B are formed out of those of *low* B there is a *release* of energy.

Now B is small (relatively) for light elements like lithium, helium, and carbon; it rises to a maximum for elements of middling atomic weight like iron; it falls again for really heavy elements like lead, bismuth, and uranium. Consequently, energy is released by forming middleweight elements either by splitting up heavy nuclei ("nuclear fission") or by joining up light ones ("nuclear fusion").

It is the latter process, fusion, that is going on in stars. The fusion processes can be studied in physics laboratories by using large accelerating machines to hurl nuclei at one another to make them coalesce. In stars the necessary high velocity of impact occurs because the plasma is so hot. Gradually the hydrogen is turned into helium, and helium into heavier and heavier elements. This supplies the energy that the stars radiate and simultaneously generates the chemical elements.

The very heavy elements present a problem. To form them from middleweight elements, energy has to be *supplied*. Since there is plenty of energy inside a star, a certain small number of heavy nuclei will indeed form, but they will continually undergo fission again under the prevailing intense conditions. How do they ever get away to form cool ordinary elements, like lead and bismuth, in the earth? One view links them with the highly explosive supernovæ, to which we have already referred (**F4** (2)). If the heavy elements occur in these stars the force of the explosion disperses them into cool outer space before they have time to undergo the fission that would otherwise have been their fate. The heavy elements are thus seen as the dust and debris of stellar catastrophes. This view is in line with the steady state theory, because supernovæ are always occurring and keeping up the supply of heavy elements. In the evolutionary theory some of the generation of elements is supposed to go on in the very early stages of the initial dense state and to continue in the stars that evolve in the fullness of time. It cannot be claimed that the origin of the chemical elements is completely known, but we have said enough to show that there are plausible theories. Time and more facts will choose between them.

The Formation of the Planets.—Did the sun collect its family of planets one by one as a result of chance encounters in the depths of space? Or was the solar system formed all at once in some generative process? To this fundamental question at least there is a fairly definite answer. The planetary orbits all lie in about the same plane and the planets all revolve the same way round the sun. This could hardly have happened by chance; indeed, it provides almost conclusive evidence for the alternative view. But what was the generative process?

Many ideas have been proposed, and the problem is very intricate. One of the most famous theories was originally championed by Kant, the German philosopher (1755), and by Laplace, the French mathematician (1796). In essence, it was held that the solar system was originally a great cloud of diffuse gas, probably rotating. Under its own gravitational attraction the cloud contracted and, in accordance with a well-established mechanical law, the contraction caused the rate of rotation to increase. When the rate was sufficient, masses of matter were thrown off from the edge and later condensed into the planets. Numerous serious objections have been raised, but the whole problem is so complex that it is unreasonable to say that any theory of this sort must be wrong. On the contrary, recent work has reinstated to some extent the view that the sun and its planets formed in a stellar condensation, one feature of which was the pushing outwards from the central sun of a disc of matter which subsequently became the planets. Such a process would be regarded as normal in stars, and not exceptional.

On the other hand, the planets have been attributed to the effect of a passing star whose gravitational attraction drew out from the sun a jet of gaseous matter which condensed into the planets. Such an encounter between stars is very rare and, on this theory, the formation of planets must be an outside chance. This theory was first developed by Jeans, but is not widely held now.

The connection between stellar and planetary theory is brought out again by the existence on the planets of the heavier chemical elements. How did they get there? If it be true that heavy elements are hurled into space by exploding supernovæ (see above), then at least one such explosion must have mingled its products with the widespread interstellar hydrogen before the planets condensed. At one time Hoyle put forward the view that the sun was once accompanied by another star (there are many such binary systems known to astronomers) and that the sun's partner exploded. Some of the ejected gases, captured by the sun's gravitational attraction, later condensed into planets, while the remnant of the star recoiled from the explosion and got away into space. This explanation was later modified in that the exploding star and the sun need not be a close pair but merely two of a cluster of stars formed at the same time.

Before leaving this subject, where theories are more numerous than firm conclusions, one more question may be raised: was the earth formed hot or cold? There are adherents to both opinions. One side would say that the planets condensed from hot gases, became liquid, and subsequently cooled and solidified, at the surface if not throughout. Others would say that dust, ice, and small particles formed in space first and subsequently accumulated into large bodies, whose temperature rose somewhat later on.

With space exploration beginning in earnest, considerable future progress in understanding planetary formation can be anticipated, and subsequent editions of *Pears Cyclopedia* will attempt to keep up with the new developments without too much time lag. (*See also* **X18: Radio Astronomy.**)

THE SOLAR SYSTEM.

Name.	Distance from Sun (millions of miles).	Diameter (thousands of miles).	Average density (water = 1).	Number of Satellites.
Sun	—	865	1·41	—
Mercury	36	3·1	3·73	0
Venus	67	7·6	5·21	0
Earth	93	7·9	5·52	1

THE EARTH

Shape and Size.—The earth has the form of a slightly flattened sphere, the polar radius being 6,357 km. (3,950·4 miles) and the equatorial radius 6,378 km. (3,963·5 miles). Its mass is $5{\cdot}97 \times 10^{27}$ gm. and its volume is $1{\cdot}083 \times 10^{27}$ c.c.; hence its average density is about 5·5 grams per cubic centimetre. This is about twice the average density of the surface material, so it is inferred that there exists a large volume of high density material within the earth. *See also* **F49**.

Structure.—From a study of the passage of earthquake waves through the earth and observations of such properties as magnetism, moment of inertia, temperature increase with depth, etc. it is deduced that the earth has a structure consisting of a series of shells. The central *core* has a radius of some 3,600 km. (2,250 miles); it is probably in part liquid, and is almost certainly composed of an alloy of nickel and iron. Separated from the core by a fairly sharp boundary is the *mantle*; this has a thickness of about 2,800 km. (1,750 miles) and is solid. It is probably composed of silicates of iron and magnesium with some metallic iron in the inner region. The outer 100 km. (62·5 miles) is the *crust*, which is solid under ordinary conditions but which may partially liquefy during periods of igneous activity. Under the continents it is possible to distinguish two layers in the crust; an upper, less dense one, probably granitic in character, known as the sial, and a lower, denser one, the sima, probably basaltic in character. The sial appears to be absent under the Pacific Ocean and very thin or absent under the Atlantic and Indian Oceans. The concept of the sial blocks "floating" in the sima provides an explanation for the observed vertical movements of continents and leads to the theory that they may have "drifted" to their present positions. The junction between the sima and the mantle is quite sharp, the break being known as the Mohorovičić Discontinuity.

Composition.—Direct observation of the crust is confined to the surface and mines or boreholes, the deepest of which reach only to about 5 miles. From analyses of the crystal rocks, the abundance of the elements in the crust can be estimated. The commonest is oxygen (46·6%), followed by silicon (27·7%), aluminium (8·13%) and iron (5%). The next four are calcium, sodium, potassium, and magnesium, ranging between 3·6 and 2%. These 8 elements total 97·57% of the whole crust. Most of the other 84 elements are present in amounts to be measured in parts per million; *e.g.*, copper occurs to the extent of 45 p.p.m., tin, 3 p.p.m. These are average proportions over the whole crust; to be workable as ores, concentrations need to be much higher—*e.g.*, both copper and tin ores have to contain a minimum of 1% metal to be economic. Locating the rare occurrences of such concentrations is the job of the prospecting geologist. Taking the earth as a whole, *i.e.*, core, mantle and crust, most authorities agree that the commonest element is iron, followed by oxygen, silicon, and magnesium in that order; after this, there is only partial agreement.

The Age of the Earth.—It is possible to make an estimate of the age of the earth by considering the rate at which radioactive elements break down into inert elements. A number of methods are now available, the most important being those based on the decay of uranium and thorium to lead. From the data obtained, estimates can be made of the following points on the time scale: Origin of the earth 4·5 to 5×10^9 years; earliest known rocks $3{\cdot}3 \times 10^9$ years (found in Rhodesia and Manitoba); life appears about $1{\cdot}5 \times 10^9$ years ago; first large-scale occurrence of fossils, 600×10^6 years ago. Other points on the scale are given in the table on **F20** (10^9 = thousand million; 10^6 = million).

The Materials of the Earth's Crust.—Geologists recognise three main classes of rocks making up the crust—Igneous, Sedimentary, and Metamorphic. Rocks are aggregates of minerals, which may be regarded as simpler, homogeneous compounds, in contrast to the complex, inhomogenous mixture which is a rock. The bases of rock classification are minerals present, shape and size of the individual grains, and the mode of origin of the material.

Igneous rocks are usually regarded as having crystallised from a molten state, although certain types may have arisen in other ways, *e.g.*, by reaction between high-temperature fluids, of the right composition, and pre-existing rocks. Typical igneous rocks are granite and basalt; granite is coarse-grained, intrusive into other rocks, and contains the minerals quartz, potash or soda felspar, and usually a mica. Basalt is fine-grained, flows out as lava at the surface and contains the minerals augite, calcium felspar, and usually olivine. Between these extreme types are some thousands of intermediates, but together granite and basalt constitute 90–95% of all igneous rocks seen at the surface.

Sedimentary rocks are derived from pre-existing rocks by the processes of weathering and erosion, followed by transport to the point of ultimate deposition of the material, which is then converted from unconsolidated sediment to rock by the process of lithifaction. Typical sedimentary rocks are sandstone, limestone, and shale. Sandstone consists of particles of quartz and occasional other minerals, whereas shales are compacted clays, which may become slate if compressed very strongly during mountain building. Limestones may be chemical precipitates, but are commonly formed by the aggregation of skeletal material of animals. Some other sedimentary types of interest are conglomerates—lithified pebble beds—and evaporites, such as rock salt and gypsum beds. The bulk of the sedimentary rocks were formed under marine conditions.

Metamorphic rocks are produced by the action of heat and/or pressure upon pre-existing rocks, producing considerable changes in mineralogy and texture. Rocks subjected to heat alone are termed hornfelses (marbles if the original rock was a limestone). Pressure alone may produce slates, but often pressure results in shearing forces which crush and break up rocks to a fine powder (subsequently lithified), known as mylonite. Heat and pressure together produce the type of metamorphism known as regional, because it occurs over large areas (*e.g.*, the Scottish Highlands), where it can be seen to have been associated with mountain-building processes. Typical rocks of this kind are schist and gneiss; the former is a foliated rock, usually with much mica, while the latter is a banded rock, with dark and light bands of quartz and/or felspar and mica and/or hornblende. Some gneisses, called migmatites, were produced by the injection of granitic material along the foliation planes of schists.

Mountain Building.—There is no general agreement among geologists about the origin of mountains, despite many years of argument. It is a matter of observation that the great mountain ranges are built of sedimentary rocks—usually much metamorphosed in the deeper levels—and occur in relatively narrow belts of great length. The idea has developed that long, narrow depressions known as *Geosynclines* develop in the crust, into which vast quantities of sediments are poured. The floor is slowly depressed by the weight of material, and ultimately the two sides of the geosyncline move together, folding the sediments both upwards and downwards, producing the complex structures seen in such regions as the Alps and Himalayas. It has been suggested that convection currents in crust, core, or mantle may provide the forces required, but some geologists believe that the earth is contracting and causing the skin to "wrinkle." Another possibility is that the sial blocks move about in the sima, and the Alps, for example, were formed when Africa drove northwards towards Europe. It is suggested that radioactive heating of the sima layers may make them sufficiently mobile to allow movement to take place, and this seems to be an essential feature of most theories of mountain building.

Glaciation.—Within the last million years much of the northern part of the Northern Hemisphere was covered by ice sheets, now reduced to the Arctic ice-cap. This has profoundly modified the landscape, especially in mountainous regions such as the Alps, North Wales, and the Scottish Highlands. The ice, moving first as valley glaciers and later as sheets over wide areas, scraped off all loose surface material, which was then available to abrade the bare rocks to give the characteristic scenery. In Britain the maximum advance of the ice-sheets brought them to the line Bristol Channel–Thames Estuary, passing just north of London. The great heaps of débris transported by the glaciers are known as moraines. The cause of the ice age is not fully understood, but it is worth noting that in the Permo-Carboniferous period in the Southern Hemisphere there was a widespread glaciation at the same time as the coal measures and desert sediments were being laid down in the Northern Hemisphere. Other glaciations are known from several other epochs as far back as 2×10^9 years.

The Oceans.—The oceans cover 75% of the earth's surface. They may be divided into three main types of environment—the *shelf seas*, bordering the continents, the *continental slopes*, transitional between the shelves and the *abyssal region*. Each region has its own type of sedimentation, fauna, and flora. Because of the virtual absence of a sial layer under the oceans, the study of the ocean floor yields special information about the sima and mantle, and may provide data leading to a solution of current problems relating to geosynclines and mountain building. Study of sedimentation in the oceans is important for understanding the ancient sedimentary rocks.

The Atmosphere.—The atmosphere at sea-level contains about 78·1% nitrogen and 21% oxygen, the remainder being carbon dioxide (0·03%) and the inert gases. It is thought that in the early stages of the earth's history much more carbon dioxide existed and less oxygen. When plants developed, the carbon dioxide was utilised in the building up of food substances with the release of oxygen in the process of photosynthesis (**F30**). *See also* **L12**, **X3**, **F46**.

The International Geophysical Year, 1957–58.—The results of the IGY observations are still being analysed and discussed in order to exhaust their scientific content. It is certain that almost all the principal investigations in geophysics during the next half century and almost all the advances in our knowledge of the earth and of the forces acting upon it will be based upon the global data accumulated during the IGY. The oceans of the world have been so incompletely studied and present so many problems, many of which could not be investigated during the IGY, that further observations are to continue over a period of years, and a comprehensive programme of observations in the marine sciences has been planned.

THE WORLD OF PHYSICS.

Anyone compelled by curiosity or professional interest to look into contemporary journals of pure physics research is soon struck by the fact that the old text-book division of physics into "heat, light, sound, electricity, and magnetism" has become very blurred. The indispensable periodical of research summaries, *Physics Abstracts*, contains about 450 entries a month, under forty separate headings. This is very daunting even to the experienced physicist and, as a token of the human effort devoted to one single branch of science, it is impressive for variety, for degree of specialisation, and for sheer volume. How can the main features of this great work be presented to the non-specialist?

Two different, though complementary, sections can be distinguished. First, there is the physics concerned with the properties of matter in bulk, with solids, liquids, and gases, and with those odd but very important substances, such as paints, plastic solutions, and jelly-like material, which are neither properly solid nor liquid. In this vast domain of physics questions like this are asked: Why is iron magnetic, copper not? What happens when solids melt? Why do some liquids flow more easily than others? Why do some things conduct electricity well, others badly, some not at all? During the last century, particularly the last few decades, it has become clear that such questions can be answered only by raising and solving others first. In particular, we must ask: (i) Of what nature are the invisible particles of which matter is composed? and (ii) How are those particles arranged in bulk matter?

The first of these two questions has generated the second major category of modern physics: this is the physics of particles and of the forces that particles exert on each other. In this field, which represents science at its most fundamental, questions like this are asked: If matter is composed of small units or particles, what are they like? How many kinds of particle are there? Do the particles possess mass? electric charge? magnetism? How do the particles influence each other? How can their motion be described and predicted?

Once scientists became convinced that matter did indeed consist of particles, the *arrangement* of the particles in matter became an important question. This is the problem of *structure*. It was discovered, by von Laue in Germany and by W. H. and W. L. Bragg in England, that the structure of solids could be inferred from the way X-rays are reflected. It is well known that X-rays can penetrate solids. In doing so, they encounter successive layers of particles and are reflected from them. The reflections reveal how far apart the layers are and how the particles are arranged in space. This is the technique of X-ray crystallography. By now it has shown that most solid matter is *crystalline*, *i.e.*, it consists of a regular pattern of particles repeated over and over again to fill the volume of the solid—just as a wallpaper is covered by repeated units of design. The units in a crystal are very small, often about 10^{-8} cm. across, and the particles in them are very close together.

Liquids, on the other hand, have no repeated pattern, but consist of particles which are jumbled up, though still very closely packed—like marbles in a bag. In gases, the particles are widely separated and moving rapidly about; the average distance between particles in air is about 10 times that in ordinary solids, and air particles have an average speed of 5×10^4 cm. per sec. (1,000 m.p.h.)

In general, therefore, the structure of matter is fairly well understood. This does not mean that structure studies are out of date, but only that now they are devoted to elucidating the structure of particular substances, often extremely complex ones such as are found in living matter. We shall therefore say no more about structure, but turn to the major divisions of physics introduced above: (i) particles and their forces; (ii) the properties of matter in bulk.

I. PARTICLES AND FORCES.

The idea that matter is composed of small particles, or atoms, originated, it is true, in classical times. Nevertheless, the modern views need be traced back no farther than the beginning of the nineteenth century, when Dalton and his contemporaries were studying the laws of chemical combination. By that time the distinctions between elements, compounds, and mixtures were already made. Compounds and mixtures are substances which can be separated into smaller amounts of chemically distinguishable constituents. Elements (*see* **N30**) cannot be so divided. In a mixture the components may be mixed in any proportion and sorted out again by non-chemical means. In a compound the elements are combined in fixed proportions by weight. This last fact gives the clue to atomic theory.

Dalton and atomic theory.

Dalton pointed out that the fixed combining weights of elements could easily be explained if the elements consisted of atoms which combined in simple numerical ratios, *e.g.*, 1 atom of element A with one of B, or one of B with two of C, and so on. For instance, 35·5 gm. of chlorine combine with 23·0 gm. of sodium to make 58·5 gm. of ordinary salt. If we assume one atom of chlorine links with one of sodium, then the atoms themselves must have weights in the ratio 35·5 to 23·0. This turns out to be consistent with the combining weights of chlorine and sodium in all other compounds in which they both take part. Sometimes two elements combine in several different proportions by weight. But this is easily explained by assuming that the atoms link up in different numbers, *e.g.*, one iron atom with one oxygen, or two irons with three oxygens, or three irons with four oxygens. Then the three different combining proportions arise from the three different numbers of atoms, *using in each case the same ratio of oxygen atom weight to iron atom weight.*

Atomic weight.

Over the century and a half since Dalton, these ideas have been repeatedly tested by chemical experiments. No one now doubts that every chemical element has atoms of characteristic weight. By convention the number 16·0000 is ascribed to oxygen and called its "atomic weight." The atomic weights of other atoms are expressed by giving their ratio to that of oxygen, *e.g.*, hydrogen, 1·008; iron, 55·85. These numbers are only ratios; the real weight of one single oxygen atom is $2{\cdot}7 \times 10^{-23}$ gm.

J. J. Thomson and the electron.

Matter is electrically uncharged in its normal state, but there exist many well-known ways of producing electric charges and currents—rubbing amber, or rotating dynamos, for example. It is therefore necessary to have some theory of electricity linked to the theory of matter. The fundamental experiment in this field was made by J. J. Thomson when, in 1897, he discovered the electron.

If you take two metal electrodes sealed inside a glass vessel, and if the air is suitably pumped out and a high voltage applied to the electrodes, then the negative one emits a radiation which causes the walls of the tube to glow. The rays are called *cathode rays*. The discovery of the electron was essentially a clarification of the nature of cathode rays. Thomson showed that they were streams of particles with mass and negative electric charge and a general behaviour unlike any other atomic particle known at that time. The importance of this discovery for the world of science cannot be overestimated, and its technical progeny are in every home and factory in radio valves, television tubes, and other devices.

Rutherford-Bohr atom.

Since the electrons emerge from matter, they are presumably parts of atoms. The relation between the negative electrons and the positively charged constituents of matter was elucidated by the great experimenter Rutherford and the great theoretician Bohr. Their work, just before the First World War, showed that the positive charge, together with almost all the mass, is concentrated in the central core or nucleus of the atom about which the very light-weight electrons revolve. The diameter of an atom is about 10^{-8} cm., roughly one-three hundred millionth part of an inch. The central nucleus has a diameter about 10,000 times smaller still. The nucleus and the electrons hold together because of the electric attraction between them.

At this stage work could, and did, go on separately along several different lines:

(i) Electrons could be studied on their own. Nowadays the handling of beams of electrons of all sizes and intensities has become a major industry.

(ii) The nucleus could be treated as a special problem, and this led to the mid-century flowering of nuclear physics, to the atomic bomb, and to nuclear power.

(iii) The behaviour of electrons in the atom could be analysed; this is the great domain of atomic physics which spreads into many other sciences as well.

Volumes have been written about each of these three fields, but we can spare only a few lines for each.

The Electron.

Electrons are expelled from solids by light, heat, electric fields, and other influences. It has therefore been possible to study beams of electrons on their own *in vacuo*. Electrons inside matter, either as constituents, or temporarily in transit, can also be observed by their innumerable effects. These observations all show the particles to be indistinguishable one from another; all electrons are the same wherever they come from. They have a definite mass ($9{\cdot}11 \times 10^{-28}$ gm.), a negative electric charge, a magnetic moment, and a "spin" (intrinsic rotatory motion). No one has ever subdivided an electron or obtained an electric charge smaller than that on one electron. The electronic charge is therefore used as a basic unit of charge in atomic physics. The electron has come to be the best known of all the "fundamental particles."

The Nucleus.

The early research programmes in nuclear physics were greatly facilitated by the occurrence in nature of certain unstable (radioactive) nuclei which emit fast-moving fragments. The latter can be used as projectiles to aim at other nuclei as targets; the resulting impacts yield much valuable information. This technique still dominates nuclear physics, though nowadays the projectiles are artificially accelerated by one or other of the large costly machines designed for the purpose.

The most important early discovery was that the nucleus consists of two types of fundamental particle—the positively charged *proton* and the electrically neutral *neutron*. These two are of nearly equal mass (about 1,800 times that of the electron), and like electrons, have a magnetic moment and spin. The proton charge is equal to the electron charge, though opposite in sign. Consider a moderately complex nucleus like that of iron. This usually has 30 neutrons and 26 protons. Its atomic weight therefore depends on the total number of neutrons plus protons, but the total charge depends only on the number of protons—called the *atomic number*. This is also the number of electrons in the atom, since the atom as a whole is electrically neutral. The atomic number determines the chemical nature of the atom (see below), so that by altering the number of *neutrons* in a nucleus we do not change the chemical species. It is therefore possible to find—and nowadays to make—nuclei of the same element which nevertheless differ slightly in weight because they have different numbers of neutrons. These are called *isotopes*. Iron isotopes are known with 26, 27, 28, 29, 30, 31, 32, and 33 neutrons, but all have 26 protons. Only those with 28, 30, and 31, and 32 neutrons occur naturally; the rest have been made.

Radioactivity—natural and artificial.

It is known that the set of neutrons and protons in a nucleus can exist in states of greater or less energy. The normal one is the state of lowest energy, or "ground state." Bombardment of an element by streams of sufficiently energetic particles, protons or electrons, for example, excites some of the nuclei to new states. The new state has excess energy and, after an average time, which varies from minute fractions of a second to many thousands of years, according to the type of nucleus, it returns to a final ground state. The return process is accompanied by the emission of radiations. If the emitted rays are electrons, then they are called *β-rays* and we

have a case of β-radioactivity or beta-decay (**F62** (1)). The electrons may be ordinary negative ones or their positive counterparts called positrons. The loss of a negative electron means that a neutron in the nucleus has changed into a proton, generating and emitting the electron in the process. This changes the chemical nature of the nucleus. For example, if copper with nucleus of 34 neutrons and 29 protons is bombarded with neutrons, the latter are absorbed and excited copper isotopes with 35 neutrons are created. Some of these emit electrons, leaving a residual proton number of 30, which corresponds to the element zinc. The others emit positrons, leaving a nucleus with one more positive charge than copper, *i.e.*, a nickel nucleus. The overall process is one example of the artificial transmutation of elements which is now a commonplace of nuclear physics.

Excited nuclei do not always emit β-rays. Other typical products of nuclear change are *α-rays* or helium nuclei (see below) and *γ-rays*, which are like ultra-violet light and X-rays but more penetrating than either of these. A handful of naturally occurring elements are radioactive, and the most famous are radium and uranium. In such substances α-, β-, and γ-rays were first discovered. At present hundreds of artificial radioactive substances can be made—to the great benefit of medicine, industry, and scientific research. (The subject of radioactivity is more fully discussed in Part IV, **F60–63**.)

Nuclear fission—chain reaction.

A discovery important not just for nuclear physics but for the whole of mankind was made by Hahn and Strassman in 1939. This was the discovery of nuclear fission in uranium. One of the natural isotopes of uranium is an unstable one, U^{235}, with 143 neutrons and 92 protons. It normally shows its instability by emitting α- and γ-rays. If uranium is bombarded with neutrons, some U^{235} nuclei temporarily gain an extra neutron, which makes them even less stable. This they show by splitting into two roughly equal parts, called fission fragments, together with two or three neutrons. There are two highly important things about this disintegration. One is that the two or three neutrons can promote further disintegrations in other uranium nuclei, and the process can therefore be self-propagating; it is then called a *chain reaction*. The other is that the total mass of the fission products is less than that of the original nucleus. This mass difference does not disappear without trace; it turns into energy according to a formula referred to in a paragraph below.

Application of these new forces.

The world has found two uses for the energy liberated in nuclear chain reactions: the atomic bomb and nuclear power plants. In the first, conditions are arranged to promote and encourage a tremendous and rapid chain reaction leading to an explosion; in the second, the steady liberation of energy in the form of heat is controlled for use in turbines which can generate electricity or provide propulsion. Both uses represent epoch-making technical achievements, but mankind has yet to show itself capable of bearing sanely the burden of responsibility which nuclear physicists have laid upon it. One thing is certain: the discoveries will not cease Already, other fissionable elements have been made and used; new chemical elements have been created; nuclear plants (" atomic piles ") have stimulated great demands for new materials that will stand the heat and radiation inside the reactor, and this promotes research in other fields of science; irradiation inside an atomic pile gives new and potentially useful properties to old materials; nuclear power drives ships and aircraft. It is difficult to write even briefly about contemporary nuclear physics without feeling keenly the ambiguity of its powerful promises.

Although so much is known about the behaviour of nuclei, the theory of the nucleus leaves much to be desired. What holds the neutrons and protons together? Why are some nuclei more stable than others? It is certain that the forces between neutrons and protons in a nucleus are unlike the electrical attractions between the nucleus as a whole and its surrounding electrons. Nor have they anything to do with gravitation. Indeed, the best description and explanation of nuclear forces is the objective of much of the contemporary research effort in nuclear physics.

Atoms, Ions, and Molecules.

Atoms.

A nucleus surrounded by its full complement of electrons is an electrically neutral system called an atom. Neither the atom as a whole, nor its nucleus, counts as a "fundamental particle" because either can be subdivided into more elementary parts, thus:

$$\text{atom} \longrightarrow \text{electrons} + \text{nucleus} \longrightarrow \text{electrons} + \text{neutrons} + \text{protons}$$

The chemical identity of the atoms of a given element, which was Dalton's key idea, depends entirely on the number and motion of the electrons. For example, the simplest element, hydrogen, has one proton for a nucleus, and one electron. The latter is comparatively easily detached or disturbed by the electric forces exerted by neighbouring atoms, consequently hydrogen is reactive chemically, *i.e.*, it readily lends its electron to build chemical structures with other equally co-operative elements. The second element, helium, has a nucleus of two protons and two neutrons; outside are two electrons in a particularly stable arrangement. Indeed, this pair of electrons is so difficult to disarrange that a special name has been coined to cover such cases—*closed shells*. Helium, with its closed shell, will not react chemically with anything. As the nuclear charge increases, different electron arrangements of greater or lesser stability succeed one another, with every so often a closed shell corresponding to one of the chemically inert gases neon, argon, xenon, krypton.

Such considerations, pursued in sufficient detail, enable atomic physics to account for all the differences and similarities among the chemical elements and, in principle at least, for the other facts of chemistry as well.

Ions.

It is possible to remove one or more electrons from an atom, leaving it positively charged. The atom is then said to be *ionised* and is called a *positive ion*. Alternatively, some atoms are capable of accepting electrons above their normal complement, thus becoming negative ions. The behaviour of ions is very important in many fields of physics and chemistry, and some of these will be referred to later.

Molecules.

Electrical attractions of various kinds cause atoms and ions to form compound groups. This is the basis of chemical combination, and the smallest conceivable fragment of compound which still preserves the chemical identity of that compound is called a molecule. Molecules have a wide range of complexity, from simple pairs of atoms to highly intricate spirals and chains composed of thousands of atoms.

Excited atoms.

Like the nuclei described above, atoms can be given excess energy and will then return to their ground state with the emission of radiation. The excess energy usually resides in one of the electrons which is executing unusually violent motion. The electron returns to normal by releasing its excess energy in the form of light whose colour is characteristic of the atom involved. Herein lies the explanation of innumerable natural and technical phenomena, such as the colours of glowing gases whether they exist in the sun and stars, in auroræ, or in street-lamps and neon signs. Herein also lies the reason for the importance of spectroscopy, which is the study

of the characteristic radiation from excited atoms; for spectroscopy is not only a useful tool for the chemical identification of elements ("spectroscopic analysis") but was one of the main routes along which twentieth-century physicists broke through to a knowledge of the inner nature of the atom.

Other Fundamental Particles.

Neutrinos.

At the moment of β-ray emission, the disintegrating nucleus also emits an energetic but uncharged particle called a neutrino. It was always supposed that this happened, because otherwise β-radioactivity would defy certain basic laws of mechanics (the conservation of momentum and angular momentum) which nobody was disposed to abandon. However, neutrinos are supposed to have no mass, and calculations show that they will traverse millions of miles of dense matter without leaving a trace; thus it was not until 1956 that an apparatus of sufficient sensitivity working near a strong source of neutrinos (an atomic pile) finally detected this more than usually shadowy particle.

Anti-particles.

Meanwhile the study of cosmic rays—the energetic rays reaching us from outer space—was revealing new fundamental particles. First, the positron, which is simply a positively charged electron or "anti-electron." When electrons and anti-electrons collide, they usually annihilate one another and turn into γ-rays. Very recently, anti-protons and anti-neutrons have been artifically produced by an accelerating machine in California (**F13**). It is not impossible that somewhere in the universe there may be "anti-matter"—even "anti-creatures"—in which the corresponding anti-particles take the place of our own electrons, protons, and neutrons. This speculation is a gift that the science-fiction writers have eagerly grasped.

Mesons and hyperons.

Cosmic radiation also contains numerous other particles of various masses, designated mesons and hyperons. These are very unstable, and spontaneously disintegrate into other more familiar particles. A table of fundamental particles is shown opposite. If the reader feels that this table does not show much rhyme, reason, or pattern, then he echoes the feeling of many physicists. The field of fundamental-particle physics stands in great need of a major stroke of clarification.

Fields and Waves.

Maxwell and electromagnetic waves.

Atoms are held together by the electric attraction of the nucleus for the electrons. Finer details of atomic behaviour depend on the magnetic moments of the particles. Any region of space subject to electric and magnetic influences is called an *electromagnetic field*. Before the discovery of the electron, Maxwell had perfected a general theory of the electromagnetic field, giving to physics a celebrated set of equations which describe satisfactorily almost all electric and magnetic phenomena. *Inter alia*, he proved that disturbances in the electric and magnetic conditions at one place could be propagated to another place through empty space, with a definite velocity, just as sound waves are propagated through air. Such electromagnetic disturbances in transit are called *electromagnetic waves*, and their velocity turned out experimentally to be the same as that of light and radio waves—which was a decisive argument to show that both of these phenomena are themselves electromagnetic waves.

Einstein and photons.

In the years between about 1900 and 1920 this view was upset by Planck, Einstein, Millikan, and others, who focused attention on phenomena (radiant heat, photoelectricity) in which light behaves like a stream of particles and not at all like waves. A wave and a particle are two quite different things, as anyone will admit after a moment's contemplation of, say, the ripples on a pond and a floating tennis ball. The acute question was: is light like waves or particles? This celebrated dilemma soon multiplied its horns. In 1927 electrons were shown to be quite capable of behaving as waves instead of particles, and this is now known to be true of protons, neutrons, and all other fundamental particles as well.

Theoretical physicists have devised means of having it both ways. To say that light behaves as particles means that the waves of the electromagnetic field cannot have their energy subdivided indefinitely. For waves of a given frequency, there is a certain irreducible quantity of energy that must be involved whenever light interacts with anything. This quantity is the product $h\nu$, where ν is the frequency and h is a constant named after Planck. Each such unit is called a *quantum of the electromagnetic field* or a *photon* and is counted as one of the fundamental particles. Frequencies and wavelengths vary widely; typical wavelengths are: radio—hundreds or thousands of metres; radar—a few centimetres; visible light—5×10^{-5} cm.; X-rays—10^{-8} cm.

It is now accepted that every fundamental particle is a manifestation of the waves of one or other kind of field. Physicists speak of waves, particles, and fields in the same breath or, rather the same equation. Little is to be gained by asking if electrons or photons are "really" particles or waves. All one can say is that they are things whose behaviour is predicted and described by certain equations. Those who must visualise can imagine particles in some phenomena and waves in others: neither conception contains the whole truth. Why should the ultimate invisible constituents of matter be forced into one or other category derived from everyday experience? For convenience, however, we shall continue to call these things "fundamental particles."

Quantum Theory.

The point of view of the last paragraph is characteristic of quantum theory, which is the currently accepted fundamental theory of matter and motion. One can reasonably ask at what position in space, exactly, is a particle? Or, what, exactly, is the wavelength of a wave? But the first question cannot be reasonably asked of a wave, nor the second of a particle. Since electrons have something in common with both, one question cannot be answered precisely for electrons without ignoring the other; alternatively, both questions can be given an imprecise answer. As the wavelength of electrons is intimately connected with their speed, one has to accept an accurate knowledge of the speed (wavelength) and ignorance of position, or the converse, or *inaccurate* knowledge of both. This is the famous Heisenberg Uncertainty Principle. Quantum theory is a set of mathematical rules for calculating the behaviour of fundamental particles in accordance with the Uncertainty Principle. In spite of its equivocal-sounding name, the principle has led to an enormous increase in the accuracy with which physical phenomena can be described and predicted. Quantum theory includes all that previous theories did and more.

Quantum theory grew up in the same epoch as the Theory of Relativity. Heroic attempts have been made to combine the two, but with only partial success so far. Relativity is concerned with all motion and all physical laws, but its characteristic manifestations occur only when something is moving with nearly the velocity of light. Quantum theory is likewise all-embracing, but its typical phenomena almost always occur when something on the minute atomic scale is in question. Consequently, the vast majority of everyday mechanics needs no more than the classical theory laid down by Newton, which is neither relativistic nor quantum.

THE ATOMIC FAMILY.

Particle.	Charge in units of one electron charge.	Ratio of rest mass to that of the electron.	Description.
Electron	−1	1	Discovered by J. J. Thomson in 1897. The number of orbital electrons in an atom determines its chemical properties. Actual rest mass = $9 \cdot 1 \times 10^{-28}$ gm. Emitted as β-rays by some radioactive nuclei.
Positron	+1	1	Positive counterpart, or "anti-particle," to the electron. Predicted theoretically by P. A. M. Dirac in 1928 and first discovered in cosmic rays by C. D. Anderson in 1932. Emitted as β-rays by some radioactive nuclei. When positrons and electrons collide they usually annihilate each other and turn into γ-rays; consequently, positrons only last about 10^{-10} sec. within ordinary matter.
Proton	+1	1836·2	The positively-charged constituent of nuclei; the hydrogen nucleus is one proton. Fast-moving protons occur in cosmic rays. Does not spontaneously disintegrate.
Anti-proton	−1	1836·2	Negative anti-particle of the proton. Its existence was long suspected. Artificially produced and detected for the first time in 1955.
Neutron	0	1838·6	Discovered by J. Chadwick in 1932. The neutral constituent of nuclei. When free it spontaneously disintegrates into a proton, an electron, and an anti-neutrino, after an average lifetime of about 18 minutes. Passes through matter much more easily than charged particles.
Anti-neutron	0	1838·6	The anti-particle of the neutron from which it is distinguished by properties connected with its magnetic moment and spin.
Neutrino and anti-neutrino	0	0	These particles travel with the speed of light and are distinguished from one another by the relation of their spin to their direction of motion. A neutrino is emitted with the positron during positive β-decay; and an anti-neutrino with the electron during negative β-decay. Their interaction with matter is extremely slight. First postulated by Pauli in 1933 and detected in 1956.
Photon	0	0	A quantum of electromagnetic radiation, *e.g.*, light, X-rays, γ-rays. The concept was introduced by M. Planck in 1900 when he described the emission of light as taking place in "packets" rather than in a steady stream. The energy of a photon is proportional to the frequency of the radiation and inversely proportional to the wavelength.
Meson			A particle with rest mass between that of the electron and proton. There are various kinds. The concept was advanced theoretically by H. Yukawa in 1935 and the first one was detected in 1937. Varieties are still being discovered. All disintegrate after extremely short lifetimes. They occur in cosmic rays and can be artificially produced in large accelerating machines.
Muon	+1 −1	206	The μ-meson. Similar to, but heavier than, the electron and positron; disintegrates into electron (or positron if positive) + neutrino + anti-neutrino.
Pion	+1 0 −1	273 263 273	The π-meson. Charged pions decay either into muons and neutrinos or into electrons and neutrinos. Neutral pions decay into γ-rays, into "positron-electron pairs," or both. Pions interact markedly with nuclei.
K-meson	+1 0 −1	About 966	These are being currently investigated. They decay in a considerable variety of ways.
Hyperon	+1 0 −1	various	A particle with rest mass greater than that of the proton. There are several kinds, not very well understood at present.

Relativity.

Historically, relativity grew out of attempts to measure the speed with which the Earth moved through that hypothetical medium, called the ether, which was supposed at that time to be the bearer of light waves. To take a simple analogy: sound waves travel through still air with a certain definite speed, v. If you move through the air with speed v' towards oncoming sound waves, they will pass you at the speed $v + v'$. Michelson and Morley, in their celebrated experiment of 1887, failed to find the corresponding behaviour on the part of light. This is so important an experiment that it has been repeated, and repeatedly discussed, ever since. In October 1958 the latest and most accurate confirmation of the Michelson–Morley result was announced. It seems as if light always travels with the same speed relative to an

observer, however fast he moves relative to anything else. Einstein put it this way: two observers moving with any constant velocity relative to each other will always agree that light travels past them at the same speed; this speed is denoted by c, and is approximately 186,000 miles per second.

This postulate, logically developed, leads to remarkable conclusions. For instance: if you walk from tail to nose of an aircraft at 4 m.p.h. and the plane is receding from me at 300 m.p.h., then you recede from me at 304 m.p.h. "Common sense," Newton, and Einstein would all agree on this. But if you could walk at $0{\cdot}25c$ and the plane moved at $0{\cdot}5c$, the Newtonian mechanics would give your recession speed as $0{\cdot}75c$, whereas Einsteinian relativity would give about $0{\cdot}71c$. Although at everyday speed, the disagreement, though present in principle, is absolutely negligible, at speeds near that of light it becomes very pronounced. Many experiments show that the relativity answer is right.

Equivalence of mass and energy.

Another famous consequence of relativity is the equation $E = mc^2$, connecting energy, E, with mass, m. c is so great that when mass is converted to energy a small mass gives a large energy. The grim demonstration of this was given to the world at Hiroshima; a more hopeful one at Calder Hall. The life-giving energy of the Sun is derived from nuclear processes which consume mass and deliver energy according to this equation.

Mass and rest mass.

"Mass" is far from being a simple notion. The only complication we shall note here is that the mass of a body is not necessarily constant. A stationary body can be observed to have a mass called its *rest mass*. If the body moves, it has energy of motion and therefore, according to Einstein's mass–energy equation, it increases its mass. Mass thus depends on speed, but in such a way that there is very little change unless the speed approaches that of light. Many experiments on atomic particles demonstrate this. The interesting question now arises: do all fundamental particles have rest mass? or do some have mass derived solely from their energy? The answer appears to be that photons and neutrinos have no rest mass; all other particles have. The Table on F13 gives their rest masses.

Special theory of relativity.

The mathematical development of Einstein's ideas, leading to the conclusions just referred to, constitutes the Special Theory of Relativity. Stated more generally, the theory raises the question whether two observers in uniform relative motion could ever detect, as a result of their relative speed, any difference in the physical laws governing matter, motion, and light. To this, Special Relativity answers: No. The detailed theory involves special consideration of the results the two observers would obtain when measuring (i) the spatial distance, and (ii) the time interval, between the same two events. It turns out that they would not agree on these two points. They would agree, however, on the value of a certain quantity made up jointly of the spatial distance and the time interval in a somewhat complex combination. The intimate mixture of space and time in this quantity has led to the treatment of the three space dimensions and time on a equivalent footing. Hence the frequent references to time as the "fourth dimension." Minkowski devised an extremely elegant presentation of relativity theory by using an extension of ordinary geometry to four dimensions. A line drawn in his four-dimensional space represents the path of a particle in space and time, *i.e.*, the whole history of the particle. Thus the movement of particles in the ordinary world is turned into the geometry of lines in Minkowski's four-dimensional world of "space-time."

Gravitation.

General theory of relativity.

The apparently innocuous extension of the preceding ideas to include observers in accelerated relative motion opened up new fields of mathematical complexity, but enabled Einstein to bring gravitation into the argument. In speaking of atoms and particles we have not yet mentioned gravity. This is because the electrical and magnetic forces acting between the particles constituting matter are much stronger than the gravitational; gravity need not enter atomic theory at all. But in the discussion of astronomical problems and the movements of large-scale, electrically uncharged bodies, it has been usual, ever since Newton, to say that two bodies of mass m_1 and m_2, separated by a distance r, attract one another with a force proportional to m_1m_2/r^2. This is Newton's inverse square law of gravitation. With this, Newton explained the movements of planets and comets and the falling to Earth of the apple from his tree.

The apple's fall is accelerated, and we observe this by noting its position relative to certain marks fixed with respect to us, and by timing it with some sort of clock. This system of location in space and time may be called our "frame of reference." We therefore assert that, in our frame of reference, the apple falls down with an acceleration which Newton saw no alternative but to attribute to a thing called gravitational attraction. Galileo had shown that *all* bodies fall with the same acceleration at all points, and we can now rephrase this by saying that in our frame of reference there is a constant gravitational attraction or *uniform gravitational field*. (This last statement and Galileo's demonstration only refer strictly to points fairly near the Earth's surface; at greater distances the gravitational field decreases and is therefore not uniform.)

Now suppose a collection of falling bodies is observed by an intelligent creature, designated C, who inhabits one of them. C has his own frame of reference fixed relative to him. In C's frame neither his own body, nor any of the others, is accelerated, and therefore he has no reason to suppose a gravitational force is acting on them. We have, therefore, the following situation:

(i) in our frame, fixed relative to us, we find all the bodies falling subject to a gravitational pull;

(ii) in C's frame, undergoing accelerated fall relative to us, no gravitational field is apparent.

It looks, therefore, as if one has only to choose the correct frame of reference for the measurements in order to remove the need for any assumptions about the existence of gravitational fields. This is a simple illustration of the connection between gravitation and frames of reference for the measurement of space and time. Einstein's General Theory of Relativity extends this to cover non-uniform gravitational fields and shows that what Newton taught us to call the gravitational field of material bodies is better thought of as a peculiarity of the space and time in the neighbourhood of such bodies. Since space–time, as we mentioned above, can be expressed in geometrical terms, Einstein has transformed the theory of gravitation into an exercise (a difficult one) in the geometry of space–time. Other physicists, in Einstein's tradition, are trying to turn *all* physics into geometry, but no one knows whether this is really feasible.

All this abstruse work is much more than a demonstration of mathematical power and elegance. Observable phenomena which fall outside the scope of Newton's theory of gravitation are accounted for by relativity. One is the small but definite discrepancy between the actual orbit of the planet Mercury and the predictions of Newton's theory. Another is the bending of stellar light rays as they pass close to the Sun, an effect which results in the apparent displacement of the position of the star. A third is the effect of the intense gravitational field of stars on the light emitted by atoms—

the fields make its wavelength slightly longer than normal.

Conclusion.

Over a century's development of the atomic ideas has brought a progressive, if jerky, increase in the mathematical precision of the theories. In some fields of particle physics, observations to one part in a million, or even better, can be explained, to that level of accuracy, by the existing theories. At the same time, however, the theories have lost visual definition. An atom as an invisible but none the less solid billiard ball was easy enough; so was a light wave conceived like a sound wave in air. Even after Rutherford, an atom consisting of a miniature solar system merely exchanged the solid billiard ball for a system of revolving billiard balls and was no great obstacle to visualisation. But since quantum theory and the Uncertainty Principle, every unambiguous visualisation of fundamental wave-particles leaves out half the picture, and although the electrons are in the atom, we can no longer represent them in definite orbits. The moral seems to be that visualisation is unnecessary, or at best a partial aid to thought. All the theoretical knowledge is in the equations, and these are very precise. Hence the non-physicists' grumble—that physics is too mathematical these days—has some justification, and hence also the growing distinction in physics between the theoreticians, who are usually mathematically trained, and the experimenters, who can rarely read the papers their theoretical colleagues write, but provide the results for them to write about.

II. THE PROPERTIES OF MATTER IN BULK.

One of the most obvious and at the same time most wonderful things about the properties of matter is their great variety. Think of air, diamond, mercury, rubber, snow, gold, pitch, asbestos. . . . Even the differences of state of the same chemical substance are remarkable enough, ice, water, and steam, for example. One of the aims of physics is to reach an understanding of all these different properties by explaining them in terms of the behaviour of the particles discussed in the previous section (**F9–14**). The widespread success with which this imposing programme has been carried out indicates the maturity of physics. It is difficult to think of any major property of matter in bulk for which there is not some attempted theoretical explanation, though future physicists will no doubt regard some present-day theories as rudimentary or incorrect.

Physics, Statistics, and Thermodynamics.

Take a number equal to the population of London, multiply it by itself, and multiply the product by another million. The answer is about the number of molecules in 1 cubic centimetre of ordinary air. They are constantly moving about and colliding with one another. Even if the nature of the molecules and their laws of motion were perfectly understood, it would clearly be impracticable to calculate the exact paths described by each particle of so vast an assembly. This difficulty brought into being a whole branch of physics concerned with calculating the overall or average properties of large numbers of particles. Just as statisticians will provide the average height, income, expectation of life, and so on, of the population of London, without knowing everything about every individual, so statistical physicists can work out average properties of molecules or atoms in large groups. This important branch of physics is called *Statistical Mechanics*. It was founded in the nineteenth century by Maxwell, Boltzmann, and Gibbs and is still being actively developed.

Consider now all the molecules in 1 cubic centimetre of air contained in a small box. They are continually bombarding the walls of the box and bouncing off. This hail of impacts (it is actually about 10^{23} impacts per square centimetre per second) is the cause of the pressure which the gas exerts against the walls of the box. Now suppose we pump air in until there is twice as much as before, though the box is still the same size and at the same temperature. This means that the density of the gas (*i.e.*, the mass of 1 unit of volume) has doubled. We should now expect twice as many impacts per second on the walls as before, and consequently twice the pressure. We therefore arrive at a conclusion that, if the volume and temperature are constant, the pressure of a gas is proportional to its density. This is one of the simplest statistical arguments that can be checked against observation; in fact, it stands the test very well.

Heat, temperature, and energy.

The proviso about the temperature remaining the same is an important one for the following reason. In the nineteenth century there was much discussion about the nature of heat. To Joule we owe the now well-established view that heat is equivalent to mechanical work. In one of his experiments, in the 1840s, the work necessary to rotate paddle wheels against the resistance of water in a tank generated heat that caused a slight rise in the temperature of the water. Joule found out exactly how much work was equivalent to a given quantity of heat. However, one can do other things with work besides generate heat; in particular, work creates motion, as when one pushes a car. Bodies in motion possess a special form of energy, called kinetic energy, which is equal to the work done in accelerating them from a state of rest. We have, then, three closely connected ideas: work, heat, and kinetic energy. Now according to the views of the nineteenth century, which are still accepted, any heat given to a gas simply increases the kinetic energy of its molecules; the hotter the gas, the faster its molecules are moving. If, therefore, the gas in our box is allowed to get hotter, there is an increase in molecular speed, and the impacts on the walls become correspondingly more violent. But this means the pressure increases, so we have another law: if the density remains the same, the pressure increases if the temperature does.

Laws of Thermodynamics.

Such considerations as these have been pursued with great elaboration and subtlety. The notions of heat, temperature, energy, and work—familiar but vague in everyday life—have been given precise definitions, and the relations between them have been enshrined in the Laws of Thermodynamics. Enshrined is perhaps a suitable word, because these laws are so soundly and widely based on experimental results that they have greater prestige than any others in physics. If any proposed physical law comes in conflict with thermodynamics, then so much the worse for that law—it has to be revised. It is sometimes asserted that no one is properly educated who does not understand the Second Law of thermodynamics. We cannot, therefore, leave this section without at least stating the two best known thermodynamic laws:

First Law: *If any physical system is given a quantity of heat, and if the system performs some work, then the energy of the system increases by an amount equal to the excess of heat given over work done.* This law asserts that heat, energy, and work are convertible one into the other, and that all such transactions balance exactly. This is one form of a principle accepted as fundamental in all science, *viz.*, the Principle of the Conservation of Energy, according to which energy can never be created or destroyed, but only changed from one form to another.

Second Law: *It is impossible to make an engine which will continuously take heat from a heat source and, by itself, turn it all into an equivalent*

amount of mechanical work. In fact, all engines which produce work from heat—steam engines for example—always use only a fraction of the heat they take in and give up the rest to some relatively cool part of the machine. The Second Law makes this obligatory on all work-from-heat devices. This statement of the Second Law has an engineering ring about it and, indeed, it arose from the work of the nineteenth-century French engineer Carnot. Nevertheless, it can be rephrased in very abstract terms, and has been applied with unbroken success to all fields of science involving the transfer of heat and allied matters. It sets a definite limit to the kinds of physical process that can be conceived to take place. Nothing has been known to contravene it.

The States of Matter.

The molecular motion in gases has been referred to in the previous section. Tacitly it was assumed that each molecule acted independently of all others, except that collisions occurred between them. In reality, molecules exert attractive forces on one another and, if a gas is cooled so that molecular movements become relatively sluggish, a time comes when the attractive forces succeed in drawing the molecules close together to form a liquid. This process is called condensation.

The molecules in a liquid are packed tightly together and they impede each others' movements. On the other hand, movement still persists, and the molecules struggle about like people in a milling crowd. Besides wandering about, the molecules vibrate. These motions represent the energy contained in the liquid.

The fact that the molecules, though irregularly packed, can still slip past one another and move from place to place, explains the essential property of liquids that distinguishes them from solids—ability to flow. As a matter of fact, although the rather vague assertion that in a liquid molecules are irregularly packed would be generally accepted, there is no agreed opinion on what the irregularity is actually like. Indeed, not only the precise structure of liquids, but the theory of liquids in general, is fraught with such considerable mathematical difficulties that the liquid state is much less well understood than the solid or gaseous.

Most solids are crystals. The popular idea of a crystal is of something which has a more or less regular geometrical form with faces that glint in the light—like snowflakes or gems. However, crystallinity really depends on a regular inner pattern of the atoms, and may or may not show itself on the visible surface. A lump of lead, for example, is crystalline, though it may not look it.

The actual arrangement of the atoms in a crystal can be extremely complex. Some are quite simple, however. The largest model of a crystal structure must surely be the 400-ft. "Atomium" building in the 1958 Brussels Exhibition. This consisted of eight balls, representing atoms, situated at the corners of a cube, and one more ball exactly in the middle. Imagine this repeated in all directions so that every ball is the centre of a cube whose corners are the eight neighbouring balls. This is known to crystallographers and physicists as the "body-centred cubic structure"; it is the actual arrangement of atoms in iron, sodium, chromium, and some other metals. If every ball, instead of being the centre of a cube, were the centre of a regular tetrahedron (a solid figure with four equal triangular faces), and had its four neighbours at the corners of the tetrahedron, then we should have the "diamond structure." This is how the carbon atoms are arranged in diamonds.

In crystals the atoms are locked into a regular ordered structure by attractive forces which give the solid its rigidity and prevent it from flowing. The atoms are so close together that any attempt to press them closer involves crushing or distorting the atoms—a process they resist strongly. This explains why solids (and liquids too) are so difficult to compress. Gases can easily be compressed because there is so much space between the molecules.

The distinction between solid and liquid is not so sharp as is commonly supposed. A lump of dough will not bounce, but is plastic; a steel ball-bearing is very elastic and bounces excellently, but one cannot mould it in the fingers. Neither dough nor steel qualifies for description as a liquid. There are, however, substances which can be moulded like plasticine into a ball that will then bounce very well on the floor like an elastic solid, and finally, if left on a flat table, will spread into a pool and drip off the edge like a liquid. There is no point in trying to force such things into rigid categories. One may say instead that for short, sharp impacts the material behaves like an elastic solid, but under long-sustained forces it flows like a liquid. The properties of these, and many other anomalous materials, are increasingly engaging the attention of those who study the science of flow—*rheology*. It is interesting to see how many familiar and important materials exhibit peculiar rheological behaviour—paint, dough, ball-pen ink, cheese, unset cement, and solutions of nylon and other plastics are only a few examples.

Inside a Crystalline Solid.

We now return to our wallpaper analogy of crystal structure and give some free play to our visual imagination.

Suppose we have walls papered with a regular pattern of, say, roses, fuchsias, and green leaves. These represent the different kinds of atoms in the solid. Careful observation shows that the whole pattern is shimmering. The flowers and leaves are not stationary, but are undergoing slight random oscillations about their proper positions. In a crystal these movements are called thermal vibrations, and are never absent. The hotter the crystal, the more the vibration, and at a high enough temperature the vibrations become so great that the atoms get right out of position and the pattern disappears altogether, *i.e.*, the crystal melts. Thermal vibrations are essential to the theory of solids, and are responsible for numerous physical properties.

Next we note something extraordinary about some of the papered walls. On these the paper has been hung in irregular patches fitted together like a not very well-made jig-saw puzzle. Lines of roses which should be vertical are horizontal in some patches, oblique in others. This represents the situation in most ordinary solids, for they consist of many small pieces of crystal irregularly packed together. Such material is called *polycrystalline*, and the small pieces are *crystal grains*. Crystal grains may be almost any size, sometimes visible to the naked eye, as often on galvanised iron.

However, on one wall, we see excellent regularity and no obvious patches at all. The physicist would call this a *single crystal*, and several techniques exist for preparing them. Natural single crystals can be found, and there are some beautiful large single crystals of rock salt. But on examining the single crystal wall closely, we find a number of places where the paperhanger has failed to make adjacent pieces register perfectly—there is a slight disjointedness. This occurs in real single crystals, and the line along which the structure fails to register is called a *dislocation*. These are much studied by physicists because of their bearing on the mechanical properties of solids, on the yielding of metals under strong stress, for instance.

This by no means exhausts the possibilities of the wallpaper analogy; several other phenomena can be found. For example, in a place where there should be a fuchsia there is actually a daffodil—something completely foreign to the pattern. Or perhaps a small wrongly shaped leaf is jammed between the proper leaves in a place that should really be blank. These represent chemical impurity atoms. The first is called *substitutional*, because it occupies the position of an atom that should be there, the second is called *interstitial*, because it does not. Substitutional impurities of indium metal, deliberately added to the semi-conductor germanium, make possible the manufacture of transistors (*see* F66). Some steels derive their valuable properties from interstitial carbon atoms within the iron pattern.

What physicists call a vacancy would occur if a flower or leaf were simply missing. Remembering that all the atoms are vibrating, we should not be surprised if occasionally an atom jumps into a neighbouring vacancy if there happens to be one, *i.e.*, the atom and the vacancy change places. Later this may occur again. In the course of time, a rose which was near the ceiling may make its way to the floor by jumping into vacant rose positions when they occur near enough. This process, which the physicist calls *diffusion*, is also analogous to the game in which numbers or letters can be moved about in a flat box because there is one vacant space to permit adjustment. The more vacancies there are in a crystal, the faster diffusion occurs. It is, in fact, very slow in solids, but is nevertheless evidence that apparently quiescent materials are really internally active.

Metals, Electricity, and Heat.

There is ample evidence that inside metals there are large numbers of free electrons. To illuminate this statement let us take sodium metal as an example. One single sodium atom has a nucleus with eleven protons; there are therefore eleven electrons in the atom. The outermost one is easily detached, leaving a positively charged sodium ion behind. We may think of these ions arranged in the three-dimensional pattern characteristic of sodium crystals. It is the same as the iron structure previously described. The detached electrons, one per atom, occupy the spaces in between. The usual metaphor is that the structure of ions is permeated by a "gas" of eletrons. Like all visualisations of fundamental particles, this must be taken as a rough approximation. The important point is that the electrons in the gas are not bound to individual atoms but may wander freely about the crystal, hindered only by the collisions they make with the vibrating ions.

This is the picture as it appeared to physicists of the first decade of this century, and we can explain many properties of metals with it. Naturally the theory has developed greatly since then, thanks to the great work of Lorentz, Sommerfeld, and Bloch; it now relies heavily on quantum theory, but it is surprising how little violence is done to modern ideas by the simple picture we are using.

The free electrons move randomly in all directions at thousands of miles per hour. If the metal is connected across a battery it experiences an electric field. Electrons are negatively charged particles, and are therefore attracted to the electrically positive end of the metal. They can move through the metal because they are free; this flow is not possible to those electrons which remain bound to the ions. The function of the battery is to keep the flow going and, for as long as it is going, it is the electric current.

The flow of electrons is not unimpeded. They constantly collide with the ions and are deflected from the path of flow. This hindrance is what the electrician calls *electrical resistance*. The electric force, due to the battery or a dynamo, accelerates the electrons, thus giving them extra energy; but they lose this to the ions at collisions because the ions recoil and vibrate more than before. The net effect of innumerable collisions is to increase the thermal vibrations of the ions, *i.e.*, to make the metal hotter. This is the explanation of the fact well known to every user of electric irons; that electric current heats the conductor. If a strong current is passed through a wire, the heating is so great the wire glows, as in electric-light bulbs, or melts and breaks, as in blown fuses.

If one end of a metal rod is heated we soon feel the heat at the other end; metals are excellent thermal conductors. This is because the mobile free electrons carry the heat energy down the rod, passing it on to the ions by colliding with them. Substances without free electrons cannot do this, nor can they conduct electricity well; so we have, in the free electrons, an explanation of the fact that the good electrical conductors are the good heat conductors. For technical purposes, it would be useful to have electrical insulators that would conduct heat well, and *vice versa*; but this is almost a contradiction in terms, and one can only compromise.

Non-conductors and Semi-conductors.

There are some elements, and numerous compounds, in which all the electrons are so tightly bound to their parent atoms that free electron flow is impossible. These materials are electrical and thermal insulators.

Let us return to our sodium atom. It readily loses its outer electron, forming a positive ion. The ion is very stable; indeed, its electron arrangement resembles the "closed shell" belonging to the inert gas neon. The chlorine atom, on the other hand, would have a very stable structure, resembling the inert gas argon, if only it could be given one extra electron to complete the closed shell. If the outer sodium electron were given to a chlorine atom we should have two stable ions, one positive and one negative. These would then attract each other and form a compound. This is just how common salt, sodium chloride, is formed, and its crystals consist of a regular network of alternate sodium and chlorine ions. As all the electrons are bound to ions, it is not surprising that salt will not conduct electricity or heat to any appreciable extent. Not all insulating compounds are built on this pattern, but all have structures which bind the electrons tightly.

We have seen (**F16**) that Nature does not permit a hard-and-fast distinction between solids and liquids; nor does she between conductors and insulators. Over a hundred years ago, Faraday knew of substances which would conduct electricity, but rather badly. A common one is the graphite in pencils. Others are the elements selenium, germanium, and silicon, and a considerable number of compounds. Such substances are called semi-conductors.

Semi-conductors conduct badly because they have so few free electrons, many thousands of times fewer than metals. In very cold germanium—say, 200 degrees below freezing—all the electrons are tightly bound to atoms and the substance is an insulator. It differs from normal insulators in that, on warming it, the gradually increasing thermal vibration of the crystal detaches some of the electrons, for they are only moderately tightly bound. The warmer the crystal becomes, the more of its electrons become detached and the better it conducts electricity. By about the temperature of boiling water, there are so many freed electrons that conduction is moderately good, though less good than in metals. This is basic semi-conductor behaviour. Because transistors can be made of germanium, and because they are of such great technical importance, more knowledge has accumulated about germanium than about any other material. The fascinating story of the semi-conductor is told in Part IV, **F66–68**.

Magnetism.

The most important thing about magnetism is that it is inseparably connected with electricity. Oersted showed this in July 1820, when he deflected a magnetic compass needle by passing an electric current through a wire near it. Since then, many experiments have shown that wherever a current flows there will certainly be a magnetic field in the surrounding space. The laws of this are very well known now—they are the Maxwell equations previously referred to (**F12**). However, most people first meet magnetism when, as children, they pick up pins with a magnet. Where is the electricity here? and what is a magnet?

The explanation of magnetism exemplifies beautifully the technique of explaining the bulk properties of matter in terms of fundamental particles. In the atoms the electrons are moving, and a moving electric charge constitutes an electric current. Therefore each moving electron is a tiny source of magnetism. It does not immediately follow that every atom is a source of magnetism because it might—and often does—happen that the magnetic effect of different electrons in the atom cancel out. In helium

atoms, for example, the two electrons have equal but opposed magnetic effects. Nevertheless, some atoms and ions have a net effect called their *magnetic moment*. This simply means they behave like tiny magnets. Crystals containing such atoms will be magnetic, though the magnetism is much weaker than in ordinary magnets because the different atoms largely annul one another's effects. In a very limited number of crystals, however, the magnetic ions act on one another in a special way which forces all the atomic magnets to point in the same direction. The total effect of many co-operating atoms is very strong and the crystal becomes what we normally call a magnet. Iron acts like this, so do cobalt and nickel, the rarer elements gadolinium and dysprosium, and a fair number of alloys. On the whole, this behaviour, which is called *ferromagnetism*, is very rare. The reason for the co-operation of all the atomic magnets is not explained to everyone's satisfaction yet, though the key idea was given by Heisenberg in 1928.

In the section dealing with the electron it was pointed out that every electron has an *intrinsic* magnetic moment. This is in addition to any effect simply due to the electron's motion round a nucleus. The net effects of ions are therefore partly due to the intrinsic magnetism of electrons. In the ferromagnetic metals the latter is by far the most important contribution. Thus we pick up pins, and benefit from magnets in other ways, because innumerable fundamental particles act in co-operation for reasons that are still somewhat obscure. It is interesting to ask whether the electrons responsible for magnetism are the same free electrons that allow the metals to conduct electricity. It is thought not.

We are accustomed to think of magnets as metallic. Actually the magnet originally discovered by the Chinese was the mineral lodestone, which is a non-metallic oxide of iron. Nowadays a number of non-metallic magnets are made. They are called *ferrites*, and some are insulators and some are semi-conductors. The combination of magnetism and insulation is technically very valuable in radio, radar, and other applications. The explanation of ferrite behaviour is related to that of metallic ferromagnetism, but is not the same.

Conclusion.

The aim of the second part of this account of physics is to show how our conception of fundamental particles allows us to build theories of the properties of matter. This very aim shows that the two "major divisions" of physics referred to at the beginning (**F9**) are divided only in the way that labour is divided by co-operating workers to lighten the task. For the task of physics is a very great one—no less than to explain the behaviour of matter; and since the universe, living and inanimate, is made of matter, physics must necessarily underlie all the other sciences.

II. BIOLOGY—THE SCIENCE OF LIFE

Biology embraces the study of all living things which exist on earth at the present time and also the recognisable remains of those which are now extinct. Living things or *organisms* range from the simplest microscopic animals and plants to the largest animals and forest trees. Although it is extremely difficult to give a comprehensive definition of life, we may attempt to distinguish the living from the non-living. All organisms when alive undergo continual physical and chemical changes. These *metabolic* processes are extremely complex, but are exhibited by even the smallest organism, however simple its structure may be. Metabolism also involves the processes of *nutrition*, *i.e.*, the intake of food materials, *excretion* or removal of the waste end products of metabolism, and also *respiration*. All organisms also exhibit *irritability*, by which is meant that they react to external stimuli and changes in their environment. *Growth* is also a characteristic of living things and involves the increase in size and complexity of the individual. Finally, all organisms *reproduce*, *i.e.*, they give rise to new individuals which enable the species to survive. It should be emphasised that non-living things may possess one or other of these properties separately, but it is only the living organism which exhibits all of them together.

THE GEOLOGICAL RECORD.

London is an old city as cities go, although not so old as Rome, but geologically speaking it is not so long since the land upon which London stands was beneath the sea. Later in time there were tropical jungles on the banks of the Thames in which sabre-toothed tigers hunted their prey, the Thames was a tributary of the Rhine, and, still more recently (in fact only yesterday on the cosmic time-scale), the great Ice Ages brought sub-arctic conditions to our land.

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify, and it is in these rocks, too, that the record of life upon earth may be traced.

No Life Rocks.—The earliest rocks in the record are known as the Azoic (no life) rocks, because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record. That is to say, for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or sand, swept by hot winds exceeding in violence the wildest tornadoes of today, and drenched by torrential downpours of tropical rain, which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1,500 million years ago.

Primitive Sea-life.—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age), when we find the fossilised remains of small shellfish, seaweeds, and trilobites—the latter were creatures somewhat like the plant-lice of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas; for as yet life had not invaded either the dry land or the deep oceans. It is, of course, clear that these creatures of Early Paleozoic times were not the first living things: they were merely the first creatures capable of leaving fossilised remains, and without doubt must have had more primitive ancestors—amœbic-like forms, jellyfish, bacteria, and so on whose bodies were too soft to leave any traces in the record of the rocks. This problem, however, will be discussed more fully later.

The Age of Fishes.—Towards the end of the Early Paleozoic Era, in what we now know as the Silurian period (see F20), there arose a new form of life: the first backboned animals, primitive fishes somewhat similar to the sharks of today; and in the division of the Upper Paleozoic Era known as the Devonian, they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants.—It is about this time, too, that we begin to find traces of animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live out

of water; for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the evolution of an impermeable outer cuticle which prevented water loss and also the development of woody tissues which provided support and a water-conducting system for the whole plant body.

Amphibia and Spore-bearing Trees.—The first type of vertebrates (backboned animals) to live upon dry land was the group of amphibia in the Carboniferous Age, which is today represented by the newts, frogs, toads, and salamanders. In all these forms the eggs give rise to a tadpole stage with gills which lives for some time entirely in water. Later the gills give place to a primitive form of lung which enables the animal to live upon land. Even so, amphibia are restricted more or less to swampy or marshy land, and without a damp environment they would dry up and shrivel to death. The most abundant forms of plant life in the Carboniferous period were the tree-like horsetails, clubmosses, and ferns, the fossilised tissues of which are found in the coal measures and are burned as household coal. But these plants also, as in the case of the amphibia, could exist only amongst the swamps and marshes, and life, although it had freed itself from the necessity of existence in the waters of the earth, still had to return to the water in order to reproduce itself. The highlands and the deeper waters of the planet were still empty of living things. Although the Carboniferous period had been a period of warmth and abundance, the Paleozoic Era came to an end with a long cycle of dry and bitterly cold ages. Such long-term climatic changes were due, it is now supposed, to such factors as changes in the earth's orbit, the shifting of its axis of rotation, changes in the shape of the land masses, and so on. Long before the Ice Ages of more recent times, there are records in the rocks of alternating periods of warmth and cold as far back as the Azoic and Early Paleozoic Eras. This long cold spell at the close of the Paleozoic era came to an end about 200 million years ago, and was succeeded by a long era of widely spread warm conditions—the Mesozoic Era, the so-called Age of Reptiles.

The Mesozoic Era.—The reptiles first appeared in the Permian, but it was during the Mesozoic era that they became the dominant group of animals. The giant reptiles included the stegosaurus, the gigantosaurus, the diplodocus, and many other kinds which were far larger than any land animals living today. Some, for example the diplodocus, were 100 ft. long, although they were vegetarian in habit and were preyed upon by other almost equally huge flesh-eating reptiles. Some species, such as the plesiosaurs and icthyosaurs, became secondarily aquatic, while the pterodactyl possessed wings with which it could glide and perhaps fly short distances. However, they all differed from the amphibia in that they had hard, dry skins, their lungs were more efficient, fertilisation was internal due to the development of copulatory organs, and they laid eggs with hard, protective shells.

It was also during the Mesozoic era that the warm-blooded birds and mammals arose from reptilian ancestors. The birds, like the reptiles, lay eggs with hard shells, and they have several internal features found in the reptiles. The fossil bird Archæopteryx, three specimens of which have been found in Germany, lived in the Jurassic period. Although it was obviously a bird, it retained many reptilian features. The fossil Trituberculata, which are also found in the Jurassic, are believed to be the fore-runners of the true mammals. Although insects were present as far back as the Ordovician, it was in the Mesozoic that many of the groups we know today first appeared.

Great changes also took place in the plant cover of the land during this era. The spore-bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these, the cycadeoids, has become extinct, but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance, and towards the end of the Cretaceous their evolution was extremely rapid. In fact, many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present-day flowering plants.

A New Era.—But, perhaps 150 million years later, all this seemingly everlasting warmth and sunshine, the lush tropical life, the giant reptiles who had ruled the world, were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Cainozoic was beginning, ushered in by a period of upheaval and volcanic activity, following which the map of the world came to resemble more closely the picture we know today. The cold period may have lasted several million years, and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era, the seed-bearing flowering plants, the birds, and the mammals. The once all-powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today: the snakes, lizards, crocodiles, and alligators. It was at this time, too, that, long after the creation of the mountains of Scotland and Norway (the so-called Caledonian revolution), or even of the Appalachian mountains (the Appalachian revolution), there arose the great masses of the Alps, the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent, the Cainozoic revolution. Initially, as we have seen, the climate of the Cainozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached, only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

The Great Ice Age.—The latter was separated by interglacial periods when the climate was milder—we are, in fact, living at the moment at the end of the last Ice Age, for the retreat of ice from Europe began only about 25,000 years ago. It must be remembered, however, that even at the height of the Glacial periods the ice never extended over the whole face of the earth; it was, indeed, limited to an area which never moved farther south than what is now Northern Germany, Northern France, the larger part of the British Isles, small areas in the North of Asia, and about half of the North American continent.

Adaptation to Environment.—The earliest mammals and birds evolved out of reptilian-like ancestors, whose scales in the former case had developed into hairy fur, and in the latter, into feathers. These developments, together with the evolution of an entirely new type of mechanism by which they became warm-blooded, no doubt enabled the mammals and birds to survive the increasing cold at the close of the Mesozoic era. Whereas the earlier species, the reptiles and amphibia, had been cold-blooded, with a body-temperature little raised above that of the surrounding environment, the warm-blooded birds and mammals developed a temperature-regulating centre in the brain which kept their temperature more or less constant independent of climatic conditions. Furthermore, as we move up the evolutionary tree, we find that increasing attention is given to the care of the young. Birds, like reptiles and amphibia, lay eggs, but unlike these creatures they look after their young, which initially have to be fed by the parents. The earliest mammals also laid eggs (even at the present day two species of mammal, the echidna, and the duck-billed platypus of Australia lay eggs), but increasingly became viviparous and brought their young into the world alive (there are, of course, a few species of snake and lizard which do the same). These undeveloped young had to be cared for by the parent animal and *taught*—in short, the possibility of a more or less prolonged period of learning arose. When we

think of the young of reptiles, fish, and amphibia, which from the outset can look after themselves, and compare them with the human child, which may spend ten or more years learning how to adapt itself and conduct its life, we can see the great importance of this new development. Intelligent adaptation became more important than mere instinct to the more complex forms of life. Finally, perhaps half a million years ago, during the first glacial epoch of the Pleistocene, the earliest type of man developed from a primeval stock of anthropoid apes.

How Did Life Arise?—Turning from this all too brief and necessarily over-simplified account of the history of life upon earth, we have to consider the problem of life in more detail. How did it arise? How have the many species of animals and plants evolved from more primitive forms of life? What is the nature of life, and how does the living organism work? How are living things classified? It need hardly be said that only the most sketchy outline of such matters can be given here, but they are so important that we must do our best to give a simple account of them.

THE GEOLOGICAL TIME SCALE.

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		Birds, Mammals and modern plants; Molluscs
	Miocene	25	
	Oligocene		
	Eocene	70	
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads; Earliest Birds; Ammonites and Sea-urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals; Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insects
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals; no life on land. Trilobites and graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		1,500	Life appears
		5,000	Origin of the Earth

THE ORIGIN OF LIFE.

There are only three possible explanations of the origin of life upon our earth: (1) that it was supernaturally created, (2) that it was brought from some other part of the universe, or (3) that it arose by natural processes from inorganic matter.

In a scientific account, however, we must reject the first two of these explanations, not because we know them to be false, but because they are not strictly speaking explanations. It is in the nature of science that it attempts to define all that we observe in terms of natural laws, and to bring in supernatural assumptions would be to break the rules of the game. This is not, of course, meant to imply that no supernatural sphere exists, but if we habitually brought in such assumptions whenever something appeared difficult to explain "naturally," there could be no science at all.

Furthermore, there is nothing whatever irreligious in the assumption (held, incidentally, by many modern theologians) that the Deity works through natural laws and does not break the laws He Himself has created. The second explanation, that life was brought from somewhere else in the universe, is also unsatisfactory: (a) because it does not explain the origins of life but merely pushes the problem one step farther back, and (b) because, if we accept the usual form in which this suggestion is put forward—that life was brought to earth inside a meteorite—we are then presented with the extremely difficult task of explaining how any living substance could survive such a journey. We are therefore left with only the third possibility, that life arose upon the earth from natural causes, and this thesis must therefore be further investigated.

The Nature of Life.—All living things are built up from compounds of the element carbon, which has the peculiar characteristic that it can link its atoms in series to form long chains of rings which are immensely more complex than the compounds formed by any other element.

When at an earlier stage we are considering the universe of non-living matter, our natural response was, perhaps, to be overwhelmed by the thought of such vast distances in time and space, to feel mere pigmies in the face of such immensity. Indeed, as the late Monsignor Ronald Knox said, "Sheer multitudinosity has power to oppress the mind." But here, when we are beginning our study of the organic sphere, it is worth while administering a corrective to our cosmic awe; for all the vast inorganic universe is really a very simple matter. It consists of nothing but radiations, subatomic particles, and atoms, and even the greatest galaxies contain only the simplest of molecules which rarely possess more than half a dozen atoms. The chemistry of even the simplest living things is almost infinitely more complex than the whole of this tremendous collection of galaxies and stars put together. Compare, for example, the formulæ of such inorganic substances as sulphuric acid (H_2SO_4), common salt (NaCl), Epsom salts ($MgSO_4$), or hydrogen peroxide (H_2O_2), with a biological substance such as insulin, which has a formula so complicated that to write it down in full would take up the larger part of this page, and we shall feel much less impressed by the mere "multitudinosity" of the non-living sphere. In his *Doubt and Certainty in Science*, Professor J. Z. Young has pointed out that the human cerebral cortex, the thinking area of the brain, which represents but a small portion of the whole, contains a number of cells more than seven times the total human population of the entire world. Furthermore, its organisation is of such inconceivable intricacy that beside it the organisation of the whole of the rest of the universe can be regarded only as child's play.

The Chemistry of Life.—So complex are many of the compounds in living cells and tissues (including blood and sap) that it was long supposed that they

could be formed only in living organs. The chemistry of carbon compounds is still called "organic" chemistry. In 1828 the German chemist Wohler artificially made the substance urea, present in blood and urine of higher animals. Many natural substances have since been made artificially, as well as others, such as chloroform, D.D.T., nylon, many drugs, dyes, etc., which do not occur in nature.

Hydrocarbons (*e.g.*, methane, benzene) consist of carbon and hydrogen only; in sugars, fats, alcohols, and organic acids, oxygen is added; the constituent amino-cells of proteins contain nitrogen in addition (some, also sulphur). Complexity is, however, mostly manifested in *arrangements* of atoms of few kinds; as in the mirror-image molecules mentioned below, and the vitamin-like carotene hydrocarbons, all $H_{40}H_{56}$, which differ biologically and otherwise.

The fact that many of the compounds found in living matter can be synthesised in the laboratory gradually led chemists and biologists to realise that, apart from its greater complexity, there is nothing unusual about the chemistry of life, and a new science, the science of biochemistry, was created. More recently an unexpected link between living and non-living was discovered when it was found that some viruses, the smallest and simplest of living things, can exist in crystalline form. Now in crystals the constituent atoms are arranged in rows one above the other, like bales of cotton in a warehouse, and it is extremely difficult to see how living things can at the same time be "alive" and yet exist in crystalline form. Nevertheless, this is so, and the viruses show the most typical of reactions of living matter in that they are capable of reproducing themselves. It is no longer so easy to draw a sharp dividing line between the organic and inorganic, the living and non-living spheres.

Origins of Life.—Life probably arose from physical agencies acting differentially on simple materials like water, carbon dioxide or methane, and nitrogeneous matter, such as ammonia (along with others) when conditions were very different from those of today. If the first step was for the materials to group into suitable systems of atoms, the question is not only *how*, but what would be suitable? The farther the inquiry is pushed, the more awkward it appears (*see* **Abiogenesis**). Three essentials stand out: the living material must contain water and be compatible with it, but must not be soluble; it must be able to reproduce in a way more specialised than viruses do; and it must have at least two kinds of organisation—biological (into at least single cells) and chemical.

Living Matter.—About 1850 Pasteur's chemical studies offered a clue which led him to studies of microbes, via fermentations. Briefly, much of living matter consists of molecules having a one-way twist or polarity; that is true of all sugars and nearly all amino-acids (above). Every such molecule can exist in at least two forms, identical in every feature except that they have opposite twists; one is like the other seen in a looking-glass. Yet, nature tends to employ only one member of the pair; the mirror-image molecule of glucose has never been found naturally.

It has been suggested that natural insistence on unsymmetrical patterns of organic molecules is a reflex or "memory" of primeval conditions exerting some preferential stimulus. Ordinary light vibrates equally—without selection—in all directions; but reflected light, as from the moon or still water, has its vibrations appreciably in particular planes or modes, and is said to be polarised. Solutions of mirror-image molecules act oppositely on polarised light, that being their main physical distinction which may have given the first selective impulse towards life.

Living is a set of reversible chemical processes, constantly going both ways so that growth or an apparently steady state is attained. When an organism becomes unable to reverse its tissue changes with the aid of its enzymes and water, it dies; because it has lost the ability to maintain its organisation, and is ready for dissolution and for the return of its elements to general circulation.

THE EVOLUTION OF ORGANISMS.

Historical Theories.—As most people are aware, the theory which attempts to explain the origin of the many species of animals and plants is Darwin's theory of evolution. But it would be wrong to suppose that the concept of evolution, the belief that all living things have developed over many centuries from much simpler forms, originated with Darwin's work in the nineteenth century; for, as we have already seen, certain Greek writers in the fifth and sixth centuries B.C. had already thought of such a possibility. Much later the Frenchmen Buffon and Lamarck, during the late eighteenth and the early nineteenth centuries, developed similar theories, and the philosopher Descartes (who died in 1650) privately held evolutionary views which he suppressed because of "distaste of hell-fire and respect for the Church."

Scientific Approach.—The importance of Charles Darwin, who, with another Englishman, Newton, may safely be accounted among history's greatest geniuses, was that he was able to present a scientific account of how evolution might have taken place—the theory of natural selection, generally described as the theory of "the survival of the fittest." Even so, Darwin's work would have been impossible had it not been for the work, particularly in the field of geology, of other great men at an earlier period. In 1788, for example, James Hutton of Edinburgh, the founder of modern geology, had shown that the history of the earth had been marked by widespread changes in sea-level, periodic volcanic action, and the raising and wearing-down of mountain ranges in the way we have already discussed. From his work it followed that the earth must be vastly more old than had previously been imagined by those who, without any adequate theological justification, had claimed the Biblical account in the book of Genesis to be literally true. Hutton was followed by William Smith, who, between 1799 and 1817, developed a technique for dating geological strata by means of the fossils they contained, and thereby showed that, at different periods in the earth's history, widely varied types of animals and plants have existed.

There have been, as we have noted already, periods when fishes were supreme, or amphibia, or reptiles; seaweeds precede ferns in the record of the rocks and coniferous trees the flowering plants. How else can these facts, which are beyond doubt, be explained, except by supposing that life upon earth has developed in a particular order and, in general, from simpler forms to more complex? Certainly attempts were made to explain away such observations, for example, by the Frenchman Cuvier, who, while accepting the geological data, supposed that each epoch in the earth's history had ended in a world-wide catastrophe, after which creation had begun anew. Even more fantastic was the thesis of the brilliant English naturalist Gosse, who was led by his religious beliefs (he was a member of the Plymouth Brethren) to accept the belief that the fossils had been placed in the rocks by a wily Deity to test man's faith.

However, the work of the early geologists made it possible for Darwin's theory to be more readily accepted by scientists than it might otherwise have been, and this theory was based upon the two facts of variation and natural selection.

Darwinian and Lamarckian Theories.—It is an observed fact that the offspring of parents in the animal and plant world both resemble and differ from their parents, and a matter of common-sense to suppose that, in a world in which not all those creatures which are born can survive, those which are best fitted to do so will live longer and reproduce themselves more abundantly than those which are less fitted to the existing conditions.

This, in essence, is the Darwinian theory, and it must be contrasted with the theory of Lamarck to the effect that characteristics acquired during the life-time of organisms could, if useful, be handed on to their offspring. The latter thesis is known as the theory of the inheritance of acquired

characters and is now rejected by most scientists, with a few exceptions who will be mentioned shortly.

Darwin and Organic Evolution.—To put the matter rather crudely, we might say that Darwin's theory of natural selection implies that giraffes have long necks because, in a country in which the food-bearing trees were tall, those animals which happened to be born with relatively long necks were at an advantage, and lived longer and produced more offspring than those with shorter necks. But long-necked parents have, on the average, more offspring with long necks (since the offspring, for reasons which we now know but Darwin did not, tend to resemble more than they differ from their parents), and so the quality of "long-neckedness" tends to increase and that of "short-neckedness" to die out.

Lamarck and Inheritance of Acquired Characters.—Lamarck, on the other hand, would have said that the parent animals had to stretch out their necks in order to reach the more succulent branches of the trees, their necks grew longer, and this acquired change was handed on to the offspring.

This theory, however, cannot reasonably be substantiated in the light of modern knowledge. Let us take, for example, the now well-known fact of drug-resistance in bacteria exposed to penicillin or the sulphonamides, when the physician finds that the formerly potent drug no longer works to destroy the bacteria and his patient may die. Is this result due, as a Lamarckian might suppose, to the bacteria becoming habituated to the drugs and passing on the resistance they have acquired to their offspring? No, as the American biologist Demerec has shown, this is not at all what has happened. The true explanation is that in every generation of bacteria there already exist, completely by accident, a few variant individuals which are resistant to the drug, and ordinarily these are so few as to make no difference to the effectiveness of penicillin or streptomycin or sulphonamide in curing the patient's illness. But if the treatment is continued too long these variants continue to multiply, and survive, whilst their competitors, formerly the "normal" bacteria, are all killed off until finally the new penicillin or streptomycin-resistant strain begins to predominate. Similarly, the insects known as water-boatmen vary "accidentally" in colour and shade, but when exposed to insect-eating fish, the water-boatmen of a colour which makes them inconspicuous against the natural background will survive and the others will not.

Natural Selection.—Darwin's idea, therefore, may be expressed as follows: (1) there are always more organisms born than can possibly survive; (2) all organisms show accidental variations from the norm; (3) any variation which proves useful in a given environment has survival value, and gives its possessor an improved chance of surviving and having more offspring; (4) that variation, therefore, will spread throughout the species by the elimination of those who do not possess it and the favouring by natural selection of those who do; (5) in this way, new varieties and even new species may come to be established.

But, it may well be asked, granted that natural selection can cause minor variations to arise within a species, is it possible to explain in this way the "*origin* of species"? Can we explain by natural selection the transformation of reptiles into birds or of monkeys into man? The answer, according to the vast majority of modern biologists, is that we can. "Natural selection," says Professor Sir R. A. Fisher, "is a mechanism for generating an exceedingly high degree of improbability." That is to say, changes which are small in themselves, may, when selectively picked out by the mechanism of natural selection, add up in the millions of years which have been available to very considerable changes in a species.

Mutations.—On the other hand, the modern biologist attaches less significance to the importance of the minute "natural" variations which Darwin emphasised, and more to the periodic occurrence of "sports" or mutations which Darwin had thought largely irrelevant. This change in outlook was due to the work of the biologist Hugo de Vries, whose *Mutation Theory* was published in 1901. De Vries claimed, and his view is now generally accepted, that evolution depends, not upon the accumulation of continuous minute variations, but primarily upon relatively large and discontinuous variations or mutations. New species, according to this theory, may arise quite suddenly because of changes in the genetic constitution of the organism of the type popularly known as "sports." Two cases of mutation which are well known to the biologist may be mentioned here: the copper beech and the Shirley poppy. The copper beech-tree, with its brownish-red leaves, is now a familiar sight in most parts of the country; but until the seventeenth century it did not exist. About that time a single specimen arose spontaneously from ordinary beech-tree stock, and it had bred true ever since. The first specimen of the Shirley poppy, with its variously coloured petals, was found by the Vicar of Shirley growing amongst a field of ordinary poppies in 1880; he sowed the seeds of the one plant he had found, and it, too, has bred true ever since. It seems likely, then, that such major types of variation occurring spontaneously are of fundamental importance in the evolutionary process.

The Evidence for Evolution.—Let us now sum up the evidence for evolution.

1. *The Geological Record.*—We have already seen that in the record of the rocks the simpler organisms precede in time the more complex. Fish appear before amphibia, and both before reptiles. Animals without a backbone occur much earlier in the record than the vertebrates. Similarly, non-flowering plants occur before flowering, and cone-bearing trees before those in which the seed is enclosed. Unless we are prepared to accept quite fantastic theories such as those of Cuvier or Gosse in order to explain such observations, it seems impossible to avoid the conclusion that evolution has happened, whatever the mechanism by which it has occurred.

2. "*Missing Links*."—Although it is true that the links between species are less common than one might expect, nevertheless such links have in some cases been found. For example, the creature known as Archæopteryx, found as a fossil, is bird-like in shape; it possessed wings and feathers, and was obviously able to fly. On the other hand, it had a long tail similar to that of a reptile, a reptile's mouth and teeth, and, whereas in modern birds the bones of the wing are fused together, this creature had a quite definite thumb. This seems a clear case of a missing link between birds and reptiles. It must be remembered that the record of the rocks is by no means complete, and that far more fossils have been destroyed in the long course of prehistory than have ever survived, and, of course, many yet remain to be found.

3. *Relatively Complete Series.*—The development of the horse is known fairly completely from the record of the rocks. The earliest-known "horse" was about the size of a hare or a small terrier, and ran about upon the tips of its three toes. It was vastly different from the horse of today. Similarly, not one, but many links are known between man and ape.

4. *The Evidence from Geographical Distribution.*—Nearly all the marsupials or pouched mammals are found only in Australia, for the Australian continent was cut off from the mainland about 60 million years ago, and at this time the more modern type of mammal in which the offspring develop to an advanced stage within the mother's womb had not been evolved. Yet, as Julian Huxley points out, although the only type of mammal naturally found in Australia is the marsupial, these have branched out into a large number of species very similar in appearance to those which developed elsewhere in the world amongst the placental or modern mammals. There are marsupials which look like dogs, moles,

squirrels, and ant-eaters; yet they have no near biological relationship to such creatures. It is almost as if life had happened to develop along similar lines in two separate planets with similar environments.

5. *Recapitulation.*—Animals develop in a way which is incomprehensible unless we assume that early development is, in some degree, a recapitulation of biological history. Why, for example, should the human child in the early stages of prenatal development show gill-slits like a fish unless it is recapitulating its evolutionary story?

6. *The Evidence from Comparative Anatomy.*—The anatomical similarities between the many different species of vertebrate are striking. As Darwin wrote: "How inexplicable is the similar pattern of the hand of a man, the foot of a dog, the wing of a bat, the flipper of a seal, on the doctrine of independent acts of creation?"

7. *The Evidence from Vestigial Characters.*—There are structures in the human body which are meaningless unless regarded in the light of evolutionary history. The appendix, for example, is useless to man, but important to certain herbivorous mammals; in the inner corner of our eye there is a vestige of the third eyelid found fully developed in birds and rabbits; the muscles whose function it is to move the ear in more primitive mammals no longer work in most men.

Modern Darwinism.—The present status of Darwinian theory is best summed up in the words of Professor Neville George, who writes in his *Evolution in Outline*: "A sharp distinction must be made between the two aspects of Darwinism. As an alternative word for biological evolution, or as an expression of the fact that evolution enters into the ancestral history of animals and plants, it is unexceptionable, and is indeed the central theme of current biology. But as implying a particular kind of evolutionary mechanism which Darwin favoured, it is by some scientists regarded as erroneous and by many others are inadequate. During the present century its deficiencies in genetics have been met by Mendelian theory, the synthesis of Darwinian natural selection and Mendelism being known as Neo-Darwinism."

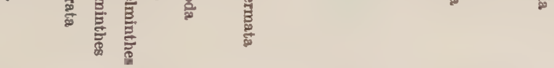
We may, therefore, conclude: (1) That evolution is an undoubted fact. (2) That "natural selection"—the "survival of the fittest," as described by Darwin is also an undoubted fact. But (3), many scientists doubt whether natural selection is *in itself* capable of explaining the evolution which has occurred (*i.e.*, whether the accumulation of *small* and *continuous* variations is the most important mechanism whereby evolution occurs).

THE CLASSIFICATION OF ORGANISMS.

The structural unit of nearly all organisms is the cell. This essentially consists of a minute amount of living substance, the cytoplasm, which contains a single, often spherical structure, the nucleus. The latter controls the activities of the cell and also carries the hereditary factors or genes (F30). In animals the cell is bounded by a thin, flexible membrane, but in most plants there is a rigid cell wall composed primarily of cellulose. There are many uni-cellular, microscopic animals and plants, as well as thousands of multi-cellular ones of diverse kinds. The naming and classifying of this vast assemblage of living things has received the attention of man for centuries. At first the main interest was a practical one, to recognise those which were useful as food, fuel, and medicine and also those which were harmful or poisonous to human beings. With the exploration of the earth by Western man so many new types of animals and plants were found and brought back to Europe that a uniform system of naming and classification became imperative, and over the last 300 years such a system has been slowly built up. It was soon realised that some species were very similar and could be grouped together in what are now known as genera and that these could be grouped together into recognisable families and so on. With the general acceptance of Darwin's conception of evolution a new element was introduced into the problems of classification. Obviously a satisfactory classification of a group of organisms should reflect the past history or evolution of that group. Thus the aim of the present-day taxonomist who is concerned with such matters is to produce a natural classification based on phylogency or true relationships. Our knowledge of this must always be incomplete, even if only because of the incompleteness of the geological record. Hence there is no finality in any proposed classification, which may have to be drastically modified as new facts about all aspects of living things are discovered.

CLASSIFICATION OF ANIMALS.

As indicated in the chart, the animal kingdom is usually divided into two groups, the invertebrates and the vertebrates. The former includes a number of distinct groups which are arranged in order of complexity. However, this arrangement does not necessarily indicate close relationships between them. Strictly the invertebrates are to be distinguished from the chordates, *i.e.*, animals possessing a longitudinal skeletal structure, the notochord. In two small groups, the hemichordates and the urochordates, this structure is still present, but in the largest group, the euchordates or vertebrates, the notochord is replaced by a cartilaginous or bony backbone. The five groups of living vertebrates are clearly distinct, but the fossil record indicates that the order in the chart reflects their evolution in time. Thus the first true vertebrates were the fishes, and from these arose the amphibia. The amphibia gave rise to the reptiles, and both the birds and mammals evolved from different unspecialised reptilian stocks.



Protozoa.—These are all microscopic animals which are unicellular, though some may have more than one nucleus and others form colonies. Many are able to swim by waving hair-like flagella or cilia. Others, such as *Amœba*, exhibit a kind of flowing movement, parts of the cell putting out pseudopodia which are followed by the rest of the cell. Protozoa are found in all types of habitat, they are abundant in the soil and fresh-water, and many of the most beautiful forms occur in the floating plankton of the seas. Others are important diseases of man, and include *Trypanosoma*, which causes sleeping sickness, and *Plasmodium* the malarial parasite.

Porozoa.—The sponges are fixed, multicellular aquatic animals, most of which are marine. Basically a sponge consists of a central cavity surrounded by two layers of cells, although the body may be branched and plant-like in form. Between the two layers of cells is a thin, gelatinous tissue containing calcareous or siliceous spicules which may be fused to form a rigid skeleton. Water is drawn in through many inhalant apertures and is passed out of the single apical exhalant aperture. Minute food particles present in the water are ingested by the inner wall cells.

Cœlenterata.—These are aquatic animals with a two-layered wall surrounding a central cavity which has only a single opening. This mouth is often surrounded by tentacles which bear many specialised stinging cells. A few live in fresh water, such as the solitary *Hydra*, but most are marine. The corals are colonial, and the remains of their calcareous skeletons form the large reefs and atolls common in the Pacific Ocean. Other familiar members of this group are sea-anemones, jelly-fish, and the floating Portuguese-man-of-war.

Platyhelminthes.—These are the worms which have soft, bilaterally symmetrical, and usually flattened bodies. The body tissue originates from three embryonic cell layers, and no body cavity is present. Some have a mouth and digestive tract, but these may be absent, and there is no blood system. The group includes the small fresh-water, free-living flatworms and also internal parasites, such as the liver-fluke which attacks sheep and the tape-worms which live in the gut of dogs, poultry, and man.

Nemathelminthes.—The round worms may be microscopic or up to 2 ft. in length. The body is smooth and pointed at both ends and has a digestive tract but no body cavity or blood system. Although they can move actively, they are unable to progress in any direction. The round worms occur everywhere, in water, in soil, and some, such as *Ascaris*, are parasites in the gut of various animals.

Annelida.—These are the worms with segmented bodies. Due to this feature, waves of muscular contraction can occur along the length of the body, and directional movement is possible. Usually they have a digestive tract open at both ends, a body cavity, and a blood system. The group includes the common earthworm *Lumbricus*, many marine worms, and the leeches.

Arthropoda.—This large group of animals has the general characters of the annelids, but there is usually a hard exoskeleton, each segment bears a pair of appendages which may have various functions, and the blood is contained in the body cavity. Further, they possess a simple " brain " at the front end of the body. The most important classes are:

Crustacea.—Mostly true aquatics which have two pairs of antennæ. Included here are the crabs, shrimps, wood-lice, water-fleas, and the sedentary barnacles.

Myriopoda.—These are the millepedes and centipedes which have only one pair of antennæ and numerous pairs of legs.

Insecta.—This is the largest of all animal groups with over 100,000 species. The body has a head bearing one pair of antennæ, a thorax of three segments, each bearing a pair of legs, and an abdomen. Usually the adult possesses wings. Cockroaches, locusts, grasshoppers, earwigs, lice, dragon-flies, aphids, moths, butterflies, beetles, flies, bees, wasps, and ants all belong to this vast group.

Arachnida.—These are mostly terrestrial, air-breathing forms with no antennæ and four pairs of legs, such as the scorpions, spiders, and mites.

Mollusca.—The molluscs are mostly aquatic and differ from the arthropods in having non-segmented bodies with restricted body-cavities. The exoskeleton is a shell. There are three important groups:

Lamellibranchiata.—These are the bi-valved shell-fish, such as the mussel, oyster, and scallop. The head is reduced, and no eyes are present.

Gasteropoda.—These molluscs are not symmetrical and possess a single shell. The head bears eyes and tentacles. Included here are the slugs, snails, limpets, and whelks.

Cephalopoda.—This is a group of highly specialised, free-swimming, marine molluscs which are bilaterally symmetrical. There is a definite head containing a brain and bearing a pair of large eyes similar to those of vertebrates. Cuttle-fish, the octopus, and the giant squids, which may reach 50 ft. in length and are the largest invertebrates known, are included here. The extinct Ammonites, the shells of which are commonly found in many rocks, were also cephalopods.

Echinodermata.—These marine invertebrates are all radially symmetrical and have a calcareous skeleton just beneath the surface. Included here are the star-fish, sea-urchins, and sea-cucumbers. The stalked, sedentary sea-lilies which inhabit the deep oceans are also echinoderms. They have a long geological history, and many extinct forms are known.

Pisces.—The fishes are all cold-blooded, aquatic, and possess gills by means of which they breathe. The body is covered with scales or spines and bears fins for balance and propulsion. The cartilaginous fishes, such as sharks, rays, and dogfish, have no bones in the skeleton, the gill-slits are exposed, and the skin is covered with many minute tooth-like spines. The much larger group of bony fishes have bony skeletons, the gill-slits are covered by a flap of tissue, and the body is covered with flat, overlapping scales. Many fossil fishes are known from as far back as the Silurian period.

Amphibia.—These are cold-blooded vertebrates which have to return to water for breeding. They show various advances over the fishes. Pentadactyl limbs are usually present, and the skull is jointed at its connection with the vertebral column so that the head can be moved. The eggs, which are laid in water, have no hard shell and hatch into a larval form with external feathery gills. With rare exceptions a metamorphosis takes place, the larva gradually changing into the adult, which possesses lungs. The skin of the adult is usually naked and may be important in assisting respiration. The class includes the newts and salamanders, which possess tails, and the frogs and toads, which have no tails in the adult.

Reptilia.—As has already been pointed out, the reptiles were the first vertebrates to become truly land animals. They are cold-blooded but have a more completely bony skeleton and more highly organised blood system than the amphibia. The egg contains much food material, which supports the developing embryo, and there is no larval stage. The present-day reptiles, snakes, lizards, turtles, tortoises, crocodiles, and alligators, are much smaller and far less numerous than those of the Mesozoic.

Aves.—The only diagnostic feature of birds is the possession of feathers, although the presence of scales on the legs, the structure of the skull, and the laying of eggs with shells are characters which indicate a reptilian ancestry. However, they show many specialised adaptations to the habit of flight. The fore-limbs are developed as wings for flapping and gliding, and the skeleton is rigid and light, with air cavities in the bones. The body i

compact and streamlined and the weight is centralised beneath the wings. As there is no bladder and the rectum is short, waste materials are not retained and the weight is thereby further reduced. The power necessary for flight requires a high metabolic rate, the maintenance of which is assisted by a large heart with a high rate of beating, a very efficient respiratory system, and a constant body temperature of 38–42° C. The 19,000 or more species of birds can be divided into the perching birds, which include many of our song birds, those which scratch for their food, such as the pheasant, the waders, such as the long-legged stork and heron, the swimming birds, which include gulls, ducks, and geese, and finally, the large flightless birds, such as the emu and ostrich.

Mammalia.—The mammals are the dominant land animals of the present time. They are warm-blooded and have a glandular skin bearing hairs. The body cavity is divided into thorax and abdomen by a muscular diaphragm, the former containing the lungs and heart, which is completely divided into four chambers. The red corpuscles of the blood have no nuclei. The ear is divided into three regions, the middle ear containing three small bones. They all possess mammary glands with which they suckle their young. In the largest group of mammals, the *Eutheria*, the young develop within the uterus of the female and are born at an advanced stage. In the small group of marsupials of Australia and Central and South America, such as the kangaroos and opossums, the young are born at an early stage and transferred to a pouch round the mammary glands, where they remain for a considerable time. There are also two species of monotreme mammals, the duck-billed platypus (*Ornithorhynchus*) and spiny ant-eater (*Echidna*) of Australia, which lay eggs. It is impossible in the space available to describe the vast range of eutherian mammals, but the main orders may be briefly referred to as follows:

Edentata.—The American sloths, ant-eaters, and armadillos, which are mostly insectivorous and have incomplete dentition.

Cetacea.—These are the entirely aquatic whales, porpoises, and dolphins, which are fish-like in form and have no hind-limbs.

Ungulata.—A large group of hoofed mammals, most of which can run quickly on land. It includes the herbivorous pigs, sheep, antelopes, deer, camels, and giraffes.

Carnivores.—These are mostly carnivorous, have keen hearing, sight, and smell, and have sharp teeth and claws for killing and tearing their prey. The cats, dogs, bears, hyenas, and also the aquatic seals, sea-lions, and walruses belong to this group.

Rodentia.—The rodents are a highly successful world-wide group characterised by the possession of long, sharp, incisor teeth which are used for gnawing. The mouse, rat, squirrel, and rabbit are examples.

Insectivora.—Small, carnivorous, mostly nocturnal mammals, such as the shrews, hedgehogs, and moles.

Cheiroptera.—The bats are truly aerial mammals which have many of the adaptations to flight found in birds. The wings are, however, sheets of skin stretching between the fingers of the fore-limbs.

Primates.—Mainly arboreal, with opposable thumb and big toe for climbing. Nails instead of claws are present at the end of the digits. They have stereoscopic vision, which is important for judging distances when jumping. The brain is well developed. The primates include the small primitive lemurs, monkeys, the anthropoid apes, such as the chimpanzee, and man, *Homo sapiens.*

THE PHYSIOLOGY OF MAN.

Digestion.—Animals, unlike plants, can exist only by taking in and digesting organic material—that is say, the dead bodies of other animals or plants. The necessary materials which they must aborb from their food come under the three categories of protein, carbohydrate, and fats. Proteins are the body-building foods, the "spare parts" if we think in terms of a machine, which are found in lean meat, nuts, cheese, and egg. Carbohydrates, the starches and sugars, are found in fruits, grains, and so on; they are fuel foods, the petrol of the body-engine. Finally, fats, found in animal and vegetable oils and fats, form the insulating system of the living machine. In addition to these, water, vitamins (see in Medical Section), certain inorganic salts, and minute quantities of certain metals (iron and calcium) are necessary to life. Dieticians measure the value of food (*a*) in terms of the necessary amounts of these basic foodstuffs, and (*b*) in terms of its energy-giving value. The average man or woman engaged in light work requires 3½ oz. of protein, 3½ oz. of fat, and 16½ oz. of carbohydrate daily, and such a diet, in terms of energy, provides nearly 3000 Calories; an individual doing heavy work may require 6000 or more Calories daily. (It must be emphasised that an adequate diet must supply *both* the requisite number of Calories and the correct *proportions* of the basic foods.) (*See* Diet in Medical Section.)

Enzymes.—Food, of whatever sort, is broken down in the digestive tract—the stomach and small intestine—into the few simple materials which the body can make direct use of. Fats end up as the so-called fatty acids and glycerine, carbohydrates as glucose and fructose, and proteins as amino-acids. The most elegant meal thus ends up in the same forms as the most humble, and this is the scientific explanation of the observation which troubled the poet:

> "It's a very odd thing, as odd as can be,
> That whatever Miss T eats turn into Miss T."
> (Walter de la Mare.)

The substances which bring about this breakdown which we known as digestion are known as enzymes, a word which means "in yeast," because it was in yeast that they were first discovered. The enzyme in yeast is, as we know, used in the baking of bread and in brewing, because of its property of breaking-down starch into sugar and alcohol; in the process it liberates carbon dioxide gas, which can be used to leaven bread. The enzymes in the digestive tract of animals, pepsin, rennin, tryspin, steapsin, and others, each perform a specific function in breaking down individual food substances. A very large number of enzymes, each producing different types of effect, have been found in nature in every kind of living thing; they exist in every tissue, and are as necessary to plants and bacteria as to the more complex animals. Life is a matter of enzymes, for nearly all vital processes take place through their activity, and it is an extraordinary demonstration of the essential unity of life that the simplest organisms possess enzymes which are very similar in nature and even in number to those of the highest. For example, a single bacterium so small that it would take about 300 million million to weigh 1 oz. may have in its protoplasm several hundred distinct types of enzyme, or even a thousand or more. It has recently been found that such drugs as the sulphonamides and the antibiotics (penicillin, streptomycin, aueomycin, etc.) produce their fatal effect upon certain bacteria by putting their enzyme systems out of order.

Environment, Internal and External.—Absorbed into the blood-stream, the amino-acids, fatty acids, and glucose go each to their appointed place: the amino-acids to replace damaged or aged tissue-cells, the fatty acids to the fat stores of the body, and the glucose to the liver, where the excess over what is required is stored in the form of glycogen. Broken-up and useless protein (nitrogenous) material is excreted through the filters of the kidneys in the form of

urea and uric acid. The body always works as a unit, and shows a remarkable ability to maintain a constant balance between its constituent substances and to compensate when its balance is upset. This tendency is described by the physiologist Cannon as "homeostasis." Although the body-balance is constantly being disturbed both by the breakdown of its own tissues and by changes in the surrounding environment, immediate steps are always taken to maintain a state of adjustment. When food material is used up the stomach muscles begin a series of rhythmic contractions which are consciously appreciated as a feeling of hunger and followed by the search for more food to redress the lost balance. Violent exercise necessitates the taking in of more oxygen, and automatically the organism breathes more rapidly; excess heat is produced and, in order to disperse this into the atmosphere, the tiny blood-vessels of the skin dilate, causing more heat to be given off, so that the body-temperature remains almost constant. In cold weather, when heat has to be retained, the blood-vessels contract, the skin becomes pale, and heat-loss is reduced. If we drink a lot, the blood might be expected to become diluted, but the excess water is excreted by the kidneys, leaving the chemical constitution of the blood unchanged; conversely, when water is lacking, the urine excreted is small in amount and concentrated. Within a great variety of changing circumstances the body-balance is maintained.

The System of Defence.—The red cells of the blood are mainly concerned with the transport of oxygen, whilst the white cells, which are normally in the proportion to the red of 1 to 500, are of various types, all concerned with defence. Bacteria entering the body exert their harmful activity through the poisonous toxins which they excrete, and one type of white cell has the function of producing antitoxins—substances which neutralise the bacterial toxins. Yet another type of white cell produces antibodies which act upon the germs, causing them to coagulate into clumps which are more easily dealt with by the third type of white cell, the phagocyte, which absorbs bacteria in much the same way as an amœba digests other small plants or creatures. Bacterial invasions of the body are a battle which either side may win or lose, and there are always casualties; in the case of an infected wound, for example, the pus which exudes from the surface is largely composed of the bodies of white cells which have perished in the struggle. This defensive system is the theoretical basis upon which is built much of the preventive medicine of modern times. When, for instance, a person is inoculated against typhoid, what we are, in fact, doing is to inject into him a carefully calculated dose of dead typhoid germs which will cause his body to respond with the production of antitoxins and antibodies. In the case of any typhoid infection these may destroy the germs completely or, at the worst, ensure that the infection is a very mild one. On the other hand, we can inject animals with the disease, causing them to produce antitoxins which are then withdrawn in the blood-plasma and injected into a person who is either already ill or has recently been exposed to infection. Whereas the former method produces what is known as "active immunity," the latter leads to a more temporary state of "passive immunity." Active agents are known as "vaccines," passive ones as "sera," the plural of the word serum. In some cases—*e.g.*, in the case of the new B.C.G. vaccine against T.B.—the patient is actually injected with live germs which have been bred to produce a weak strain harmless to the individual but nevertheless capable of producing immunity when they are injected.

The Nervous System.—Perhaps the simplest way of understanding the nervous system, which has the function of correlating all the activities of the complex mechanism we have been discussing, is to regard it as a hierarchy of control similar to that found in a factory or the army. All the more important messages reach the Board (the cerebral cortex or higher centres of the brain) along the sensory nerves (the incoming telephone system), and on the basis of this information the Board sends out directions as to what to do along the motor nerves (the outgoing telephone system). But, it need hardly be said, the arrival of *all* available information from below, so far from being a help, would be a nuisance, and to a considerable extent the various departments have to be autonomous and manage their own internal affairs. A prick from a pin causes the limb to be rapidly drawn away from the source of pain long before ever the message has reached the brain; for the incoming message goes at once to the spinal cord which automatically sends back the impulse to withdraw. This is an example of the simplest kind of nervous action described as a spinal reflex. A more complex type of automatic control is seen when we attempt to learn skating or cycling: in this case we begin by painfully and deliberately carrying out the appropriate actions, which, at this stage, are initiated by the cerebral cortex. But as we improve the actions are taken over by the lower centres in the cerebellum and elsewhere, which act as an automatic pilot in an aircraft, and we cycle or skate without conscious effort. It is therefore a principle of nervous action in the more complex animals that the higher centres should not be troubled with what can equally or more effectively be carried out by the lower ones.

Autonomic Nervous System.—That part of the brain which we have described as the hypothalamus is the control centre of the most primitive nervous system: the automatic nervous system, which takes the form of certain nerve chains lying at the back of the chest and abdomen. The familiar term "solar plexus" refers to one of the ganglia or knots of nerve cells upon this chain, which possesses many such ganglia scattered throughout its length. Whereas the nerves of the central nervous system are either sensory or motor in function, the nerves of the autonomic system are divided into what are described as sympathetic and parasympathetic groups, the former concerned with preparing the organism for emergencies, the latter with preparing it for relaxation. When the organism meets a dangerous situation, it has only two possibilities of action—fight or flight—and the sympathetic division of the automatic nervous system has the function of preparing it for such circumstances. It is this part of the nervous system which produces the rapid heart-beat, the dilated pupils, the pallor, and (in the case of hairy animals) the erect hair of the back and neck, all of which are the outward signs of fear and anger. There are also internal changes: an increased blood-sugar, an increase of blood-supply to the muscles with a reduced supply to the internal organs, and so on. All these changes, which result from the secretion of a substance known as adrenalin into the bloodstream under the influence of sympathetic stimulation serve a useful function to the organism—they increase its fighting efficiency, or, should the worst come to the worst, its ability to escape.

The parasympathetic division of the autonomic nervous sytem has an exactly contrary effect. Under its influence, the heart beats more slowly, digestion (which is inhibited by sympathetic action—hence the danger of eating when one is angry or worried) proceeds peacefully, the pupils contract, and the skin becomes flushed. The results of parasympathetic stimulation are seen at their most obvious in the baby after it has been fed at its mother's breast, or, a somewhat similar situation, in the gourmet who, after a large meal, is settling down to enjoy his cigar. The autonomic nervous system has only recently been fully investigated, and is of tremendous importance in understanding the so-called "psychosomatic disorders" such as angina pectoris, gastric ulcer, high blood-pressure, and so on, all of which are believed to be physical diseases due basically to chronic anxiety. The autonomic nervous system is, in fact, the physical basis of the emotions; the thalamus, the part of the brain in which emotions become conscious.

Hormones.—The sexual characteristics of men and women are controlled by secretions from the sex-glands. These secretions are examples of

the important class of physiological substances known as hormones which have a profound influence upon the body functions, structure, and even the personality of the individual. The thyroid gland in the neck produces a hormone named thyroxin which, when secreted in excess, causes the individual to become thin, excitable, flushed, and nervous; when, on the other hand, the secretion is lacking, as in the disease of myxodema, the patient becomes slow, stupid, and emotionally dulled. The suprarenal glands, which, as the name implies, lie above the kidneys, produce several hormones, one of which, adrenalin, we have already described in connection with the autonomic nervous system. Adrenalin enables the individual to face an emergency, to fight or run away. Another suprarenal hormone, cortisone, has recently produced dramatic results in the treatment of certain diseases; it is mentioned in the Medical Section. All these glands have this in common, that they secrete their hormones directly into the bloodstream instead of by way of a duct; they are therefore known as the endocrine or ductless glands. The most important endocrine gland of all is the pituitary, which is about the size of a pea and situated just below the hypothalamic area in the base of the brain. The pituitary has been described as the "conductor of the endocrine orchestra," since it controls all the other glands, and more than any other gland it profoundly affects body-build and character. Pituitary defects or excesses may cause the individual to grow into a giant (gigantism or acromegaly); to grow monstrously fat; to become a human skeleton; to be a wizened dwarf or a child who never grows up. Here again, as in the case of the autonomic nervous system we find ourselves on the narrow border-line between physiology and psychology.

THE PHYSIOLOGY OF OTHER ANIMALS.

Digestion.—What we have said about the structure and function of the human body applies very closely to the other mammals. It may be useful to note, however, some of the variations which have resulted from adaptation to widely divergent ways of life. In the case of digestion, for example, there are characteristic differences between the digestive systems of animals which are carnivorous and those which are herbivorous. All herbivorous animals have flat grinding teeth for crushing their food, and sheep have no front teeth in the upper jaw, the teeth being replaced by a horny plate against which it clips off the blades of grass with the lower teeth and swallows them immediately. The stomach of sheep and other animals that chew the cud consists of four separate compartments, and the food swallowed during grazing enters the first two compartments, in which it is stored and softened. After eating, the sheep settles down quietly to "chew the cud"—a process in which the food from the first two compartments of the stomach is returned to the mouth for further chewing; it is then returned through the first two into the third compartment, and returned again. Finally, it reaches the last, the true stomach, where it is digested by the gastric juices. Carnivorous animals need sharp tearing teeth, and as their food is largely protein, and protein digestion begins in the stomach, they gulp their food down, as one may observe in a dog.

The amœba eats simply by flowing round and absorbing food-particles, and even in more complex animals such as the hydra, the body-cavity and digestive tract are identical. Earth-worms, however, have a more complex digestive tract consisting of mouth, pharynx, crop, and gizzard (in which the humus upon which they feed is crushed into a soft pulp) before entering the intestine. This sort of arrangement is very similar to what is found in birds in which the food from the mouth (which is without teeth) passes down the œsophagus to be softened and stored in the crop. From the crop it enters the stomach to mix with the digestive juices, and then passes on to the gizzard, which has thick muscular walls and contains stones which the bird has swallowed and which take the place of teeth. In the gizzard the food is ground to a pulp.

In birds there is no separate excretion of urine and fæces, and the fæces contain waste matter from both intestines and kidneys which passes out through a single tube or cloaca, which is also the tube by which impregnation takes place and by which eggs leave the body. Bird fæces are rich in nitrogenous materials and, in the form of guano, are a valuable manure.

Movement.—Movement in the mammals is usually upon land, but we have the interesting exceptions of seals, sea-lions, walruses, and whales, in which the limbs have become modified to form flippers for swimming in water. Nevertheless, these flippers in their bony structure correspond, bone for bone, with the limbs of land animals. The limbs of bats have been even more drastically modified for progression in the air; in this case the bones of both fore- and hing-legs have become encased in the covering of skin which forms the wing. Other, although slighter modifications, are seen in the use made by monkeys and man of the fore-limbs for manipulation of objects; man, however, is the only mammal which does not use the fore-limbs for walking at all.

Reproduction.—Of course, all mammals, in common with birds, reptiles, amphibia, and indeed the vast majority of living things, produce eggs within which their young develop. The only difference is that in the placental mammals the egg hatches out inside the mother and does not possess a hard shell. The human infant, for example, develops within a membrane which resembles a cellophane bag filled with fluid in which the infant floats, and when we read of a baby being born in a "caul" this means that the bag did not rupture before birth as is usually the case. The child, in fact, was born in an egg-shell. Both birds and reptiles lay eggs upon land where they need protection, therefore they usually have a hard, or at any rate a leathery, shell; in the case of birds the egg needs to be kept warm by the parent's body and the offspring has to be fed, but reptiles usually live in hot climates and trust to the heat of the sun to hatch their eggs, after which the young are ignored. The young of reptiles are capable of looking after themselves immediately after birth, so reptiles, unlike birds, have few parental responsibilities. It is obvious, too, that all animals living upon land must reproduce themselves in such a way that fertilisation takes place within the mother's body; their mode of sexual intercourse, therefore, assumes more or less the same pattern as in the mammals. In the case of frogs and other amphibia, however, although copulation takes place with the male lying on top of the female's back and grasping her around the chest, fertilisation actually takes place just outside their bodies in the water as both simultaneously set free the male and female sex-cells.

By the time we reach the level of the fishes the possibilities of love between the sexes and parental care of the offspring become even less; for, although some fishes like the stickleback build nests which are guarded by the male, the eggs of most fishes are fertilised in the water. The female ejects the eggs at random to fall to the bottom of the pool or the ocean bed, and the male later sprays the "milt" or male sex-cells over them to produce fertilisation.

Further peculiarities of sexual reproduction may be noted amongst the insects. In the ant, for example, the male and female go on a "nuptial flight," during which the female is fertilised; the male is short-lived, and neither male nor female use their wings on any other occasion. On this single occasion, the female takes into her body enough spermatozoa to last her for the rest of her life as a queen. As the thousands of eggs pass out of her body, some are fertilised by the sperms and others not, the fertilised eggs developing into male and females in the usual way, the non-fertilised developing into workers which are sterile or neuter females. Ants, as in the case of butterflies, bees and wasps, and other insects, pass through a complicated life-history; the eggs hatch into grubs or caterpillars, these later build cocoons or chrysalises (which are often mistakenly described by the sellers of fish-foods as "ant's eggs"), and from the cocoon arises the full-grown insect. But worker ants are not the only animals

which can develop without fertilisation—even animals as high in the evolutionary scale as frogs can develop from eggs which have been specially treated in salt solution or pricked with a needle. Such individuals therefore have only one parent, the mother.

Still lower down the scale, we find that worms and snails are bisexual—that is to say, both male and female sex cells are present in the same individual. When copulation takes place, each individual fertilises the other. Finally, at the simplest levels, we have the asexual reproduction of the amœba, which simply divides into two. Other single-celled animals, such as the slipper animalcula, paramecium, can reproduce both sexually and asexually.

Respiration.—Respiration occurs by various methods in different animals species, from the amœba and other single-celled animals which depend upon direct absorption of oxygen dissolved in the surrounding water to the complex breathing systems of larger creatures. Worms, like amœbæ and other simple creatures, absorb oxygen directly through the skin and transport it by means of hæmoglobin, which, as in man, is the oxygen-carrier of the blood. The hæmoglobin of worms, however, is dissolved in the plasma, and is not, as in the higher animals, contained in red cells. The bodies of insects are covered in a hard, horny armour made of a substance known as chitin, and they therefore cannot absorb oxygen directly as worms do. Nor is the oxygen carried in the blood-stream. Instead, they have a row of apertures or spiracles along both sides of the body communicating with thin branching air-tubes which ramify throughout the system to which they supply oxygen without the intervention of the blood-stream. The oxygen is forced in and out of the body by movements of the abdominal wall similar to the breathing movements of other animals.

The breathing-apparatus of the fish has to be modified for a life in water, and, as is well known, the oxygen-containing water is taken in at the mouth and passed out at the gill-slits. Beneath the gills there are rows of filaments richly supplied with blood which absorb oxygen and discharge carbon dioxide through their thin walls. The tadpoles of frogs and other amphibia also possess gills, which at first are external, and then, like those of a fish, internal. Finally, some time before the tadpole leaves the water, the lungs develop, and it has to come to the surface in order to breathe atmospheric air. Adult frogs breathe through their nostrils, and air is forced into the lungs by contractions of the floor of the mouth (this, of course, is why the floor of a frog's mouth can be observed to move constantly up and down). But, even when fully-grown, frogs absorb additional air both through the lining of the mouth and through the damp skin.

In birds, breathing is adapted to the necessity of flying and a life of great activity. Muscular contraction of the chest wall produces expiration, not inspiration, as in the case of mammals. The lungs do not expand, and the excess of inspired air is stored in air-sacs outside the lung itself, but communicating with the lungs. When a bird breathes in, fresh air fills both lungs and air-sacs, and the oxygen is absorbed within the lungs as in mammals; on breathing out, the used air leaves the lungs, which are immediately filled with fresh air from the sacs. In the bird, therefore, *both* inspiration and expiration supply fresh air to the lungs—an important adaptation for such an active creature.

CLASSIFICATION OF PLANTS.

There are various ways in which the main classes of the plant kingdom can be grouped, but a simple, up-to-date arrangement is given in the chart. Vascular plants are often known as the *Tracheophyta* because they all possess woody conducting elements. These are absent in non-vascular plants, and the bacteria, fungi, and algæ are often called *Thallophyta*, *i.e.*, they have a relatively simple plant body or thallus. Many of the bryophytes also possess a thallus, but in some there is a stem bearing leaves, although a true vascular system is absent. Many thallophytes are aquatic, whereas the tracheophytes are mostly land plants in which the development of woody tissues can be related to the attainment of the land habit as the plant kingdom evolved. However, the chart should not be taken as indicating the evolutionary relationships of the various groups. It is more a convenient arrangement which reflects the relative complexity of the plant body.

Plant Kingdom

- Non-vascular Plants
  - Bacteria
  - Fungi
  - Algae
  - Bryophyta
- Vascular Plants
  - Psilopsida
  - Sphenopsida
  - Lycopsida
  - Pteropsida
    - Filicinae
    - Gymnospermae
    - Angiospermae
      - Monocotyledones
      - Dicotyledones

Bacteria.—This is a vast group of minute organisms of very simple structure. They are spherical or rod shaped and may exist as separate cells, some species being motile, or as long chains or irregular masses. Their minute size makes the elucidation of their structure very difficult. There is a wall of unknown composition, and cytoplasm which contains glycogen and fat. Electron-microscope studies have revealed the presence of structures which appear to consist of nuclear material. Multiplication is by simple division, which may take place very rapidly. For example, *Bacillus subtilis* can divide every 20 minutes, so that in 8 hours a single cell may give rise to 16 millions. Recent research indicates that a sexual process may also occur. Bacteria can survive unfavourable conditions by producing a resistant spore within the cell. They do not possess chlorophyll, though a few are pigmented. Most obtain their food already formed, and are thus either saprophytes or parasites. The saprophytic bacteria occupy a vital position in the living world. They are responsible for most of the decay of dead organic matter, and it has been truly said that without them the surface of the earth would soon become completely covered with the dead bodies of animals and plants. Bacteria also play a vital part in the circulation of nitrogen in nature. By breaking down organic material ammonia is released and ammonium carbonate is formed in the soil. This is oxidised by other bacteria to form nitrates, which can be absorbed by plants again. Yet other bacteria can "fix" atmospheric nitrogen, and one species, *Rhizobium leguminosum*, occurs in the root nodules of plants such as clover and lupins. These plants are often grown on poor soils and ploughed in, thus improving the fertility of the soil. The parasitic bacteria are also of great importance, as they are responsible for many diseases of plants, animals and man.

Fungi.—This is a large group of plants, none of which contain chlorophyll. Hence, like the bacteria, they are either parasites on other living plants and animals or saprophytes which live on dead organic matter. Some are unicellular

aquatic plants, but many have a body called a mycelium composed of many branched threads or hyphæ. In the higher fungi (*e.g.*, toadstools, bracket fungi, and puff-balls) complex reproductive structures are formed. All fungi produce spores. In the aquatic species these may be motile, but the majority form minute, airborne spores. The spore output is often very great, and a single mushroom may produce 1,800 million spores. Some fungi are serious diseases of crop plants, such as potato blight and wheat rust.

Algæ.—These are essentially aquatic plants which contain chlorophyll. They range from microscopic forms to the large seaweeds. The green algæ (*Chlorophyceæ*) live mostly in fresh water and may be unicellular, motile or non-motile, or filamentous, though a few found in tropical seas are more complex. The brown algæ (*Phæophyceæ*) are mostly seaweeds which possess a brown pigment, fucoxanthin, which masks the green chlorophyll. They include the bladder-wracks (*Fucus*) and kelps (*Laminaria*) of our coasts and the seaweeds which form dense floating masses over hundreds of square miles of the Sargasso Sea. Other groups are the red algæ (*Rhodophyceæ*), mostly seaweeds of delicate form, the unicellular motile diatoms (*Bacillariophyceæ*), and the blue-green algæ (*Cyanophyceæ*). All algæ possess unicellular reproductive organs. Various types of life cycle occur, the most complex being found in the red algæ.

Bryophyta.—These are the liverworts (*Hepaticæ*) and the mosses (*Musci*). They are all small plants characterised by a sharply defined life-cycle. This consists of an alternation of generations, the "plant" being a gametophyte bearing sex organs. The latter are multicellular, the female archegonium containing a single stationary ovum and the male antheridium producing many motile sperms. The latter are released and swim in water to the archegonium, where fertilisation takes place. After this a sporophyte is formed which is always dependent on the gametophyte and never becomes free living. The sporophyte usually consists of an absorbing foot buried in the tissue of the gametophyte and a stalk or seta bearing at the top a single sporangium. In many mosses this is a complex structure with hygroscopic teeth which move apart only when dry, thus releasing the minute spores only when conditions are suitable for their dissemination in the air. The bryophytes are of little economic importance, and may be looked upon as an evolutionary side-line. However, they occupy suitable "niches" in many plant communities, and species of the bog-moss *Sphagnum* cover large areas where rainfall is high.

Psilopsida.—This is a small group of primitive, vascular, spore-bearing plants. Its only living representatives are two rare genera of the Southern Hemisphere. However, a number of fossil forms are known from the Devonian period. The best known are those found in the chert at Rhynie in Scotland. The plants are excellently preserved, and their internal structure can be easily seen. They were probably marsh plants with prostrate and erect leafless stems, although *Asteroxylon* had simple leaves.

Sphenopsida.—The only living members of this group are about twenty-five species of horsetails (*Equisetum*). In the Carboniferous period many tree forms existed (*e.g.*, *Calamites*), the remains of which are very common in coal deposits.

Lycopsida.—In the Carboniferous period the tree clubmosses were also prominent members of the forests (*e.g.*, *Lepidodendron*). They often reached 100 ft. in height, were branched or unbranched, and had large simple leaves. They also had extensive root systems. The only living members belong to a few genera of small herbaceous clubmosses, such as *Lycopodium* and *Selaginella*. Like the true mosses, they have an alternation of generations, but the elaborate plant with stem, leaves, and roots is the sporophyte, and the gametophyte is very small. In *Lycopodium* only one kind of spore is produced, and the resultant gametophyte is bisexual. *Selaginella* produces numerous small microspores which give rise to the very reduced male gametophytes and motile sperms and the few large megaspores which produce the female gametophytes. The latter are formed within the megaspore wall, which splits to allow the sperms to reach the small archegonia.

Filicinæ.—These are the true ferns, which in some classifications are put with the horsetails and clubmosses in the Pteridophyta or vascular cryptogams (*i.e.*, vascular plants without seeds). The ferns have a long fossil history, and remains very similar to the living Royal ferns (*Osmunda*) are known from the Carboniferous. The ferns are widespread and particularly abundant in tropical forests. The majority are herbaceous perennial plants, but a few are aquatic, and there are some tree ferns, which may reach 20 ft. in height. Most ferns possess a stem bearing roots and large leaves or fronds. The plant is the sporophyte and produces numerous spores in sporangia borne on the fronds. Each spore gives rise to a minute green free-living gametophyte known as the prothallus, which bears the archegonia and antheridia. After fertilisation a young sporophyte develops, which at first draws nourishment from the prothallus. Thus, as in the *Bryophyta*, external water is essential for the motile sperms to swim in, and there is a clearly defined alternation of generations, but the sporophyte is a complex independent plant, and the gametophyte is reduced though free-living.

Gymnospermæ.—These were the dominant land plants in the Mesozoic era, although fossil remains are found as far back as the Devonian. The living members still form large forests in the North Temperate regions. They are mostly tall evergreen trees with roots, stems, and small leaves. The conifers include the pines (*Pinus*), larches (*Larix*), and yews (*Taxus*). The cycads are a relic group of tropical plants with thick, unbranched trunks and large fern-like leaves. The maiden-hair tree of Japan (*Ginkgo biloba*) has also had a long geological history. Another interesting Gymnosperm is *Metasequoia*, a genus well known to palæobotanists. In 1948 a few living specimens were found in a remote area of China. Seeds were collected and plants are now being grown in botanical gardens all over the world. The Gymnosperms are characterised by the production of "naked" seeds, which are usually borne on cones. The male pollen grains, which are equivalent to the microspores of *Selaginella*, are carried by wind to the ovule of the female cone. The pollen germinates and the pollen tube carries the male gametes to the reduced archegonia borne on the female prothallus, which, unlike those of the ferns, is retained within the ovule on the parent plant. After fertilisation an embryo is formed, the prothallus becomes the food store or endosperm, and the outer part of the ovule becomes the seed coat. The cycads and *Ginkgo* retain a primitive feature in that the male gametes are motile and they swim to the archegonia from the pollen tube.

Angiospermæ.—The apparent sudden rise of the Angiosperms in the Cretaceous period is still the "abominable mystery" it was to Darwin. Various suggestions have been put forward, but nothing definite is known about the origin of the group. The Angiosperms or flowering plants are now the dominant group over most of the land surface of the earth, and at least 250,000 species are known. Apart from the natural vegetation, the majority of our crop and garden plants are Angiosperms. They occur in every type of habitat and range in form from gigantic trees to minute plants, such as the duck-weeds. Some are climbers, others succulents, and a number have reverted to the aquatic habit. Although most possess chlorophyll, a few are partial (*e.g.*, Mistletoe) or complete parasites (*e.g.*, Dodder).

The diagnostic feature of the group is the production of seeds, which are completely enclosed within the female part of the flower, the ovary. Basically a flower is a short reproductive shoot which bears several whorls of lateral organs. At the base are several, often green, protective sepals forming the calyx, and above this are the

often brightly coloured petals of the corolla. Within this are the stamens of the andrœcium or male part of the flower. Centrally is the female gynœcium of one or more carpels containing the ovules. The parts of the flower may be free, as in the buttercup, or fused together. In many species the petals are fused (sympetalous), the stamens are borne on the corolla (epipetalous), and the carpels are fused to form a compound gynœcium (syncarpous). The stamens possess anthers, which produce pollen grains. These are shed and carried by insects or wind to the receptive stigmas of the carpels. Each produces a tube which grows down the style to the ovary and enters an ovule. The ovule is a complex structure containing an ovum and a primary endosperm nucleus. Two male nuclei are discharged from the pollen tube, one fuses with the ovum and the other fuses with the primary endosperm nucleus. After this "double fertilisation" an embryo is formed which is embedded in the nutritive endosperm and the outer tissues of the ovule form the seed coat or testa. The ovary of the carpel develops into the fruit containing the seeds. Fruits are of various kinds, being either dehiscent and opening when mature to release the seeds or indehiscent, with a succulent or dry wall. The indehiscent fruits are shed as a whole, and often contain only a single seed. Seeds and fruits show great variation in structure, and often have adaptations assisting dispersal. Some have hairs or wings which aid wind dispersal, whereas others have hooks or are sticky and are transported by animals. Some have flotation devices and may be carried a great distance from the parent plant by water. Seeds vary in size from the microscopic seeds of orchids to those of the double coconut, which may weigh 40 lb. Only about 10% of the weight of a seed is water, and the embryo, although alive, is dormant. The bulk of a seed consists of stored food material, commonly fats or starch and proteins, which may be contained in the endosperm surrounding the embryo, although in some species the endosperm is absorbed during seed development and the food is stored in the one or two swollen seed leaves or cotyledons of the embryo.

John Ray (1627–1705) was the first botanist to recognise the two great divisions of the Angiosperms—the dicotyledons with two seed leaves and the monocotyledons with only one. This primary division of the flowering plants has stood the test of time and is still recognised. Other differences are also found between the two groups. The dicotyledons usually have net-veined leaves and the floral parts are in fours or fives, whereas the monocotyledons usually have leaves with parallel veins and the floral parts are in threes.

THE PHYSIOLOGY OF SEED PLANTS.

When a dormant seed is planted it takes up water and dissolved oxygen from the soil and germinates. Early growth is dependent on the food reserves present in the seed, but when these are exhausted the young plant becomes self-supporting. The root hairs absorb water and simple inorganic compounds of nitrogen, phosphorus, potassium, calcium, magnesium, sulphur, and iron. These, together with certain trace elements, such as boron and manganese, are essential for healthy growth. The water passes up the woody tissues of the root and shoot, and a great deal is lost by evaporation through the stomatal pores present in the leaf surfaces. In most plants the stomata are only open during the day, and it is through these that gaseous exchange also takes place. Oxygen is taken up from the atmosphere and carbon dioxide is given out due to respiration. In photosynthesis light energy from the sun is absorbed by the green chlorophyll in the leaves and is used in the photolysis or splitting of water molecules. The hydrogen of the water combines with carbon dioxide, and organic compounds are formed, while the oxygen is given out. Thus green plants are unique in the living world in being able to synthesise organic compounds from carbon dioxide and water, and it is upon this process that all life ultimately depends.

Like all organisms, plants react to their environment in many ways. They exhibit many growth movements or tropisms. For example, stems are commonly positively phototropic and grow towards light, and they are also negatively geotropic and grow away from the centre of gravity. Many roots are positively geotropic and also positively hydrotropic and grow towards water. Some plant organs also exhibit nastic movements and can assume various positions. Thus many flowers and leaves open out during the day and close at night.

THE MECHANISM OF HEREDITY.

The subject of heredity is a vast one, and no attempt will be made here to describe it in any detail. The most that can be attempted is to give a brief account of how characters are handed on from one generation to another—a discovery which is mainly due to the pioneer work of the Austrian monk Gregor Mendel (1822–84). Curiously enough, although Mendel was a contemporary of Charles Darwin, and had, in fact, discovered facts which would have been of the greatest use to Darwin in elaborating his theory of evolution, nothing was known of Mendel until his theory, published in obscure scientific journals, was brought to the public notice long after his death, in the early years of this century.

It had been known, of course, for many centuries that animals could be mated deliberately in order to produce offspring with the qualities desired by stock-breeders and farmers. But this process had been a haphazard one which by no means always produced the expected results. Mendel, in the garden of his monastery, was the first individual to experiment scientifically with heredity by deliberately observing the interaction of single specific characters. His most important experiments, which we shall describe here, were carried out on the ordinary garden pea, in which it is a relatively simple matter to distinguish several inherited characteristics: some seeds are round, other seeds wrinkled; some seeds are green, others yellow; some plants are tall, others dwarf. By deliberately fertilising one type of plant with the pollen of another, Mendel was able to observe how these characters were handed on.

The layman might suppose that such characters mingle to form others which are a compromise between the two—that the offspring of one tall and one short parent would be medium-sized; that green seeds crossed with yellow would result in greenish-yellow seeds. But this is not the case when we are dealing with pure characters. In his experiments Mendel first of all produced pure lines of dwarf and tall peas by constant inbreeding; these were tall and dwarf lines which bred true to type. He then crossed one with the other and found that the offspring were *all* tall; this is described as the F1 (first filial) generation. When the hybrids of the F1 generation were interbred, another generation—the F2—developed, in which tall and dwarf peas reappeared in the proportion of three tall to one dwarf; but further breeding showed that only some of these tall plants bred true and the others were hybrid. There were, in fact, two hybrid to one dwarf and one tall. This relationship is best expressed in the following diagram:

```
                    Tall crossed with Dwarf
                              |
                        Tall (hybrid)        (F1 generation)
                              |
      ------------------------------------------------------
      |                       |                           |
1 Tall (pure)           2 Tall (hybrid)            1 Dwarf (pure)     (F2 generation)
      |                       |                           |
      |            ---------------------------            |
      |            |          |              |            |
Tall (pure)     1 Tall   2 Tall (hybrid)   1 Dwarf    1 Dwarf (pure)
```

As the result of his experiments Mendel deduced that all characters are transmitted from parent to offspring as separate units which are arranged in pairs of contrasting factors or allelomorphs. The gametes or sex cells can each carry only one of such pairs: tallness or dwarfness, green or yellow seed-colour, wrinkled or round, but never both of the contrasting factors together.

Genes and Chromosomes.—Although Mendel did not know this at the time, these factors are carried on the genes strung along the bodies known as chromosomes within the nucleus of each cell. Every cell in the animal or plant body (with few exceptions such as the human blood-cell) has a nucleus, which when it is about to divide to give rise to another cell, breaks up into the chromosomes, which are tiny rod, comma, or globular-shaped bodies composed of many separate genes. In the ordinary cell-division by which the cells of the body multiply or replace each other, each chromosome divides down the middle, so that each daughter cell gets the same genes—that is to say, the same hereditary material. But, since sexual reproduction implies the union of two sex-cells from separate individuals, the number of chromosomes (which is constant for any one species) would always be doubling when male and female sex-cells meet if there were not some method by which this could be avoided. When, therefore, the sex-cells are formed, the chromosomes do not divide down the middle into two equal halves; instead, half of the chromosomes go to one cell and half to another, so that each sex-cell contains only half the number contained in the body-cells. The pure-bred tall peas carried in each body-cell two factors for tallness, so that when division for the sex-cells occurred each sex-cell had one factor for tallness, and the same applied to the pure-bred dwarf peas. Hybrids, on the other hand, had in their body-cells one factor for tallness and one for dwarfness, and when division for the sex-cells occurred, some gametes were left with a unit for tallness and others with a unit for dwarfness. So, if two hybrids were crossed, the possibilities for the offspring were: tall unites with tall, tall unites with dwarf, dwarf unites with tall, and dwarf unites with dwarf. According to the laws of probability, these various possibilities will occur in the statistical order 1 : 2 : 1, or, in other words, there will be one tall and one dwarf to every two hybrids. But the hybrid offspring will always look tall, for tallness is dominant to dwarfness, which is what is known as a recessive character. Therefore, in the F2 generation, there appeared to be three tall peas to one dwarf, although of these only one was a pure line. Of any pair of allelomorphs, according to Mendel's theory, one must be dominant and the other recessive—that is to say, when the two facts are mixed the dominant one is the one which influences the immediate result. In human beings, for example, brown eyes are always dominant to blue, and therefore two blue-eyed parents cannot have a brown-eyed child.

Evolution by Natural Selection and Mutation.—As we have elsewhere seen, some writers believe that evolution cannot be explained purely in terms of natural selection, which, says Professor Neville George, is a passive filter eliminating the "unfit" and then showing a bias in favour of those surviving, ". . . but it cannot induce structural novelties for future selection, and thus cannot initiate evolutionary lines." Novelties, according to de Vries and most modern biologists, can only arise by mutation—that is, by the drastic modifying of the genes, which occurs either spontaneously or by outside interference. It is now possible to produce mutations by means of drugs, X-rays, and so on, and some authorities have suggested that the supposedly spontaneous mutations are produced by "cosmic rays" reaching the earth from outside space. These rays have great penetrating power, and it is quite possible that they might produce such effects upon the sex-cells of animals or plants.

III. THE ORIGINS OF HUMAN SOCIETY

THE EARLIEST MEN.

In the last section we brought our study of life down to the period known as the Pleistocene and the four Ice Ages. It was during these ages that man first appeared upon the face of the globe somewhere about 700,000 years ago. Now, a period of 700,000 years is not a long time in terms of the sort of figures we were discussing in Part I of this section when we were dealing with the origins of the universe, but it is a very long time relative to the scale of recorded history. For example, it is only 500 years ago since Columbus discovered America, and 1,000 years ago Alfred was King of England and the Norman Conquest had not yet begun. When we go back to 2,000 years ago, British history does not even exist; for Britain was an unknown island—or, at any rate, an island known only by rumour and travellers' tales to a few educated Romans. A further step back to 3,000 years, and there was no Roman Empire—indeed, there was no city of Rome—and the only literate people in the world were the Chinese and the Egyptians. Finally, 5,000 years takes us right back to the beginnings of written history in Babylonia and Egypt, and earlier than this no written records exist; yet this is only a minute fraction of the period we are considering.

Four Phases of History.—It is convenient to divide the whole of human history into four main periods—or perhaps it would be simpler to say that there have been four main turning-points in the history of man. In the first period, which started at the beginning of the Ice Age 700,000 years ago, *Homo sapiens* (that is, modern man of our own species) was only one of a number of other types which we shall discuss later. For the present it is simplest to describe them as: (1) ape-men; (2) half-brained men; (3) full-brained men with ape-like faces. That is to say, some were species most closely related to the apes, others approached the human type but had smaller brains than *Homo sapiens*, and yet others had large brains but ape-like features.

At the beginning of this period man had learned to make tools of stone and perhaps wood and bone. He may have been able to speak, and later on discovered how to make fire. By the time the period was over (and this took 650,000 years—by far the largest part of human existence), *Homo sapiens* was monarch of all he surveyed and had eliminated his ape-like and half-brained rivals. Throughout all these many thousands of years man's home was in the warmer parts of Asia, Europe, and Africa, the areas south of those where frost in winter makes life uncomfortable. Neither man himself nor his more primitive associates had reached the New World of America.

The second phase lasted about 30,000 years, and ended about 6000 B.C. During this phase, man began to learn how to cook foodstuffs and he—or more probably his wife—acquired the knowledge of sewing and making clothes to protect himself from the extremes of weather. Perhaps this discovery had something to do with his advance from the warmer areas of Europe, Asia, and Africa into the colder North and finally across the Behring Straits into what is now America. He was a hunter, and after some hundreds of thousands of years invented the bow and arrow and domesticated the wild dog; still he knew little or nothing of the art of cultivating plants for food or domesticating cattle, fowls, sheep, and so on. These first two phases are known by archæologists as the Paleolithic or Old Stone Ages because the main material for making tools was stone. Together, the two phases fill more than 90% of the whole period of human history.

The third phase began, as we saw, about 6000 B.C., and was a stage of increasingly rapid progress in civilisation. Stone tools gave way to tools of bronze and, later, iron. Man passed through the New Stone Age (Neolithic), the Bronze Age, and the Iron Age. He domesticated farm animals, cultivated crops, and in place of the wandering hunter there was the farmer who had a more or less fixed abode. This phase, with its ever-increasing technical progress, has lasted

right up to a few years ago. The wind, animal, and water power prevalent until the eighteenth century gave way to the steam engine, electrical power, the world of steel, concrete, and artificial materials of the twentieth century. Although in time the phase occupied less than 1% of human history, it was man's greatest hour. He obtained an ever-increasing control over nature, over other animals, plants, materials—over everything except, perhaps, his own nature. In some ways he became, as time went on, more humane to his fellow-man, less war-like, more civilised—or so he thought—throughout the nineteenth century and up to 1914, when the First World War broke out. The third phase came to an end during the Second World War with the explosion of the atomic bombs at Hiroshima and Nagasaki. When it came to an end man had been taught two lessons: first, that beneath his skin there was still a primitive and savage nature which his grandfathers had thought to be dying out as the world became more "civilised," and second, and more terrifying still, that he now had, as his forefathers had not had, unlimited power for destruction.

These then are the turning-points in the history of man. First, man the animal (who, however, differed from other animals in certain important ways, and particularly in the possession of a large brain and the power of speech), then man the hunter with his spear or bow and arrow, then the neolithic farmer, whose discoveries in new materials and new methods of production led, by way of the Bronze and Iron ages and—many centuries later—the Industrial revolution, to the world of the earlier twentieth century.

Lastly, there is the atomic revolution which has opened new and tremendous possibilities once more for the human race.

The important point to note is that for almost 90% of his whole history man made hardly any progress at all—or, at any rate, progress was slow and painful. It was only after the hunter gave place to the farmer in Neolithic times that power over the environment and technical progress really got under way, and ever since then it has moved ever faster, until now we have difficulty in keeping up with it.

Having taken this brief bird's-eye view of history in order to set the scene, we can now go back to prehistoric days to see what happened in greater detail.

The Earliest Men.—Since, of course, there are no written records from these early days, we are left to deduce the record of prehistoric man from his bones, his stone tools, and, at a later stage of prehistory, from his paintings in caves, remains of villages, and stone circles. However, for the moment we have to go back in time to a period when man did not exist at all, to a period about twenty million years ago when a species of large monkey lived in the tropical forests of Africa, and possibly in Asia. They lived on fruit, roots, bird's eggs, and young birds which they took from the nests.

But in the course of centuries there were changes in the climate and the forests began to shrink. The supply of food grew less, and the monkeys (or those which survived) had to take the dangerous step of moving out into the plains. No longer could they live in the trees—they had to walk on the ground and constantly risk their lives where there were prowling lions and other enemies. They also acquired a taste for meat—probably at first from the remains left by beasts of prey. This was the first act in a long evolution—the leaving of the tree-tops for the ground.

Centuries went by, and, with other climatic changes, the forests moved back over the plains once more. When this happened three groups of monkeys began to evolve. When they had first left the trees the original species had gone about the plains on all fours. Some of them continued to do so, and became the types now represented by baboons. But others had learned to stand erect, and of these some went back to the forests, becoming the ancestors of the present-day apes—the chimpanzees, gorillas, and so on—whilst others remained on the plains. This last group became the forerunners of man. Man is not, therefore, descended from the apes; the fact is that both apes and men are descended from a common ancestor, the one who came out of the tropical forest into the plains. Man's ancestor accepted the challenge of the plains, whilst the apes did not and went back to their original home when the possibility arose.

Ape-men.—Then, about ten or fifteen million years ago, at some time in the Miocene or Pliocene periods (see **F20**), there developed in East Africa and Northern India the two types of apeman known as *Proconsul* (the African variety) and *Sivapithecus* (the Indian one). Both probably walked erect and were about the size of a modern chimpanzee. Nevertheless, this particular evolutionary development branched out, so that, it is now believed, by the end of the Pliocene—about one million years ago, there were a number of new species; ape-men (such as the ones we have just been discussing), primitive types of men with projecting eye-brow ridges and chins and with small brains, and, finally, men with brains and features like those of people living today.

The Age of Ice.—About this time the warm climatic conditions which had been typical of the Miocene and Pliocene periods gave way to a period of violent changes in climate—the Pleistocene or era of Ice Ages. Great sheets of ice formed at the North and South Poles and spread towards the equator. In the South they had only the ocean to spread into, but in the North the ice moved over half of Europe and North America. There were four Ice ages, in between which the ice sheets melted and moved back; the seas fell to low levels with the freezing of their waters, and rose to very high levels as, in the interglacial periods, the ice melted once more.

These changes in climate stimulated the more intelligent species of our ancestors to make new adaptations—new tools, clothing, and ways of living—whilst the less intelligent were wiped out. By the end of the Age of Ice there was only one species of man left upon the face of the earth—*Homo sapiens*. Modern scientists believe that every type of mammal now alive existed at the beginning of the Pleistocene, but, on the other hand, many species then alive no longer exist. They were unable to accept the challenge of climatic changes. The Age of Ice was the great testing-time.

Half-brained Men.—We can now discuss in greater detail those more primitive types which came to an end during the Pleistocene. But first of all we have to mention the fossilised ape-men remains discovered in South Africa from 1924 onwards by Dr. Robert Broom. About six different types were discovered, and they are collectively described as Australopithecines—a name which has nothing to do with Australia but simply means "ape-like creatures of the South." These ape-men were about the same size as *Proconsul*, the earlier type, but had larger brains. They were not ancestors of modern man, since, as is now generally believed, *Homo sapiens* was in existence already at that time—the beginning of the Pleistocene—in other areas of Africa.

In 1890 a Dutch doctor, Eugene Dubois, discovered a primitive skull-cap, jaw-bone, and thigh-bone in Java, and named the new-found species "the erect ape-man"—*Pithecanthropus erectus*. Java man was the size of modern man, but had beetling brows and a retreating chin. His brain was larger than that of the ape-men, but smaller than that of modern man. For many years those who disbelieved in the theory of evolution persisted in stating that the few very primitive types of remains then known were really nothing to do with human evolution at all—they were the skulls of idiots or abnormal men. But Dubois has been shown to be right, after all, in his insistence that *Pithecanthropus* was a genuine species; for during the 1930s the German investigator von Koenigswald discovered no less than five other specimens of *Pithecanthropus* and related types in Java.

Then, in the period between 1927 and the outbreak of the last war, pieces of fifteen skulls and other bones were discovered in a cave near Peking. The discoverer was Franz Weidenreich, and the species was named Peking man or *Sinanthropus pekinensis*. Like *Pithecanthropus*, he was a full-sized man with a half-sized brain.

Full-brained Men with Ape-like Faces.—A more advanced type of man is represented in certain species, which, while in body development not unlike *Pithecanthropus*, possessed a modern-sized brain. The main species of these fossil remains are the following:

(1) *Homo rhodesiensis*, or Rhodesian man, found at Broken Hill, Rhodesia, in 1921. Another specimen was found in 1953 in Cape Province.

(2) *Homo soloensis*, or Solo man, eleven specimens of which were found some years ago in Java. Solo man and Rhodesian man were really the same species, having gorilla-like faces but human bodies and brains. They existed in South Africa and Indonesia towards the end of the Pleistocene.

(3) *Homo neanderthalensis*, or Neanderthal man lived in the northern limits of human or semi-human habitation, and his remains have been found in Western Europe, North Africa, and the Middle East. He was short and stocky, but otherwise pretty similar to Solo man.

Where Early Man Lived.—If we chart on a map of the world the places where the various types of man have been discovered, we find that the more primitive types are found on the areas towards the periphery, the more advanced ones in the centre. This is in accord with a zoological principle that more advanced species tend to push the less advanced outwards towards the edges of inhabitable territory. Thus the types of sub-men we have so far discussed lived mainly in China, in South Africa, in Java, and in those areas of Europe and the Middle East just out of reach of the ice. The real centre of development through the Ice Ages was therefore in the Sahara desert (as it now is), in Arabia, and in East Africa, with some outposts in Western Europe. These are, in fact, the areas where the earliest remains of *Homo sapiens* are found.

Conflicting Theories.—Now up till fairly recently it had been held that *Homo sapiens* had not been very long upon the earth and was a later development of the types of ape-men and half-brained men we have just been discussing. But it now seems probable that we must push back in time the origin of modern man to the very outset of the Middle Pleistocene. Also, it is not now believed that Neanderthal man and his predecessors (except possibly Peking man) were in the direct line of descent of modern man. In fact, his line of descent is completely unknown, although we must assume that such a line exists.

Two specimens, Swanscombe man and Galley Hill man found in the Thames valley, certainly date back to the Middle Pleistocene and are genuine examples of *Homo sapiens*, but the main bone of contention (in both senses of the word) is a jaw-bone and several teeth found by Dr. Leakey in Kenya in East Africa about 1932. Dr. Leakey, by considering the geological levels in which the bone was found, the stone tools laying near by, and by chemical tests, estimated that it belonged to the very beginning of the Pleistocene. In 1959 Dr. Leakey and his wife found in the fossil-rich gorge of Olduvai in Tanganyika a skull and crude tools of a human-like creature dating back about 600,000 years, which Dr. Leaky believes to be the connecting link between ape-men and true men.

PHYSICAL ENVIRONMENT.

Environment and Culture.—It is clear that no people could enter a Bronze or Iron Age unless bronze and iron were, in fact, available in their environment. Hence the Eskimos, who have no metals available to make into weapons or ornaments, still use stone, ivory (from walrus tusks), and bone. In short, their environment does not permit a higher degree of culture. Africans and Australian aborigines do not wear many clothes, not because they are stupid, but because in the places where they live it is more comfortable to live without clothes—indeed, the supposedly backward aborigines have kinship and religious systems so complex that the poor white man's head reels at the attempt to comprehend them. The primitive races or "backward" peoples have evolved ways of life which are often well adapted to the environments in which they live, and, after all, it is by no means self-evident that a civilisation which has devised atomic warfare, a high degree of economic frustration, and concentration camps, is a "superior" one, however we choose to define superiority. The second point, again an obvious one which is almost invariably forgotten, is that great advances are only made upon the foundations erected by others. The scientists of ancient Greece, Newton, or Copernicus could not possibly have evolved Relativity Theory, not because they were less intelligent than Einstein, but because every innovator can only progress a little beyond what he has received from his predecessors in many different lands and times. The house of science is not built top floor first, but slowly upon the bases laid by earlier thinkers. In the spheres of art, literature and religion, we can hardly speak of progress at all. The great Greek dramatists are still great, and the work of the Aurignacian painters of thousands of years ago is still lovely today. Who was the great religious genius who, extending the concept of "neighbour" beyond the mere confines of the tribe, wrote in the Book of Leviticus: ". . . the stranger that dwelleth with you shall be unto you as one born among you, and thou shalt love him as thyself; for ye were strangers in the land of Egypt"? We do not know. Nor do we know who it was who first pictured a tolerant, loving, and understanding God who could take pity upon the wicked city of Nineveh and ask himself: "Should not I spare Nineveh, that great city, wherein are more than sixscore thousand persons that cannot discern between their right hand and their left hand; and also much cattle?" There are many "primitive" tribes in existence today who cannot imagine anyone beating a child; some in which suicide is unknown; and a few who have never waged war. "Civilisation" is not such a simple concept as we once supposed, and technological advance does not necessarily imply high moral standards. However, the fundamental point is that all scientists are agreed that there are no significant intellectual differences between any of the races in existence today, and that the reason why some peoples are relatively backward is either because the raw materials necessary for technological advance have been lacking in their environment, or because by a historical accident their country has been out of contact with the general flow of civilisation, so that the spread of new ideas did not reach within their boundaries. Those who are inclined to look down on the so-called backward races should remember that it is not so long ago since the British looked just as backward to the Romans as other peoples do to us today. It was Cicero who, in the first century B.C., wrote to a friend: "Do not obtain your slaves from Britain, because they are so stupid and so utterly incapable of being taught that they are not fit to form a part of your household."

PATTERNS OF CULTURE.

Cultural Traits.—But if inherent biological differences such as race are incapable of explaining the observed differences between, say, a Frenchman, an Englishman, and a Japanese, how can such quite real differences be explained? Or, to come nearer home, what of the differences between English, Scots, Irish, and Welsh which undoubtedly exist? What of the Celtic, Saxon, or Norman blood in which some people take such pride? Well, to begin with, the English are such

a mixed "race" that it is quite impossible to pick out any pure strains; we are all mongrels, as Daniel Defoe realised when he wrote:

"This from a mixture of all kinds began
That heterogeneous thing, an Englishman."

For the matter of that, we do not have to go very far back in history to see that the English character has changed a great deal. In Elizabethan times, for example, England was the most musical nation in Europe, whereas in Victorian days the Englishman's lack of musical sensitivity was a universal joke in other countries. Today many foreigners laugh at our sentimental fondness for animals, but in the seventeenth and eighteenth centuries, bull-baiting, cock-fighting, and so on were universal sports. In Elizabethan times, again, the ideal man was gay, fond of play-going, amorous, passionate, and quarrelsome—can we recognise in this the Englishman of today? It would be wrong to suppose that no continuity of tradition exists, and doubtless there are many ways in which the Englishman of Elizabethan times, or even of Norman times, resembles the contemporary Englishman. But equally there can be no doubt that there have been fundamental changes. Why this should be so will be considered later.

Definition of Terms.—Anthropologists, then, are agreed that, although it may be quite correct to speak of "national character," we cannot explain this in terms of race or heredity. The true explanation is that such traits are cultural rather than biological in origin, and, since the "culture concept" is immensely important in modern social science, we must first of all define our terms:

> A *society* is a group of people who live and work together, regarding themselves as members of the group, and feeling towards it an emotion best described as "belonging."
> A *culture* is the way of life followed by such a group—that is to say, its written or unwritten laws, its religious beliefs, its ideals, its art, technology, and even its pots and pans.

Without written records we are left to deduce the record of prehistoric man by the culture to which he belonged—Azilian, Magdalenian, Chellean, and so on—and here the archæologist, who knows very little of the ideals and religious beliefs or laws of these bygone peoples is generally thinking in terms of their *material* culture. The material culture, as we have seen, includes such objects found during excavations as pots and pans, knives, weapons, needles, and ornaments. But when we talk of culture in relation to present-day peoples, although such objects are included in our definitions, we are more often thinking of the way of life of the group—its ideals, incentives, and unwritten laws. Culture is what has been described as the "cake of custom," and its importance lies in the fact that it is the cement which binds the members of a group into a living organism.

Sub-cultures.—It should not be thought that the word "group" necessarily refers to the national and tribal groups with which we have so far been concerned. Any semi-permanent collection of people within which the members have a sense of belonging together and possessing common beliefs and customs is a "group." All of us are members, not of one group only, but of many, and each group, however small, has a culture of its own, a way of life to which we must conform if we wish to retain group membership or, at any rate, the respect of the other members. As an example, let us take an imaginary individual with the name of George Campbell, who happens to be a Lowland Scot, a Presbyterian, a Socialist, a coal-miner working at the coal-face in a particular pit, a pigeon-fancier, and a follower of Newcastle United football team. The interesting thing is that, knowing these facts, we already know a great deal about Mr. Campbell; for we can be sure that his membership of these groups (national, religious, political, sporting, and so on) will strongly influence his behaviour. One of the serious defects of classical psychology and of much popular thought is that it failed to notice how much of the individual's day-to-day behaviour arises, not from the depths of his unconscious or from what is ordinarily described as his "character," but simply from his need to conform to the, often unwritten, rules of his membership groups. If anyone suggested to our Mr. Campbell that he was not an entirely free agent, that he was not as independent as he prides himself on being, he would, no doubt, be very annoyed. Nevertheless, this is merely a commonplace statement of fact. Campbell has all the prejudices of the Lowland Scot—he thinks that education is a "grand thing," that Roman Catholics are a dangerous and superstitious sect, that the English are a somewhat inferior nation over the Border who regrettably lack stamina and intelligence, and that money, although the root of all evil, is a good thing to have and be careful about. But, had he been born in the South of Italy, he would have regarded education as the exclusive possession of wealthy landowners, Catholicism as the only true religion, the English would have meant little to him at all (until the last war), and his goods would be exchanged by barter rather than money. Mr. Campbell enjoys his morning porridge and bacon and eggs, but his enjoyment of them is only a prejudice learned in childhood and his opposite numbers in Africa and France enjoy locusts, frog's legs, and snails, which it has never struck him to regard as "food" at all. His grandfather might have worn a beard, but if Campbell came to work wearing one, he might find himself in difficulties; this is one of the many quite innocuous things which are "not done" in certain groups. Campbell might, on special occasions, wear a kilt, but Mr. Smith over the Border would find himself under considerable social pressure to stop doing so if he ever had the temerity to start. There is no law saying that Scots or Englishmen may not strip to the waist in a hot cinema or theatre, but they do not do so, although a miner may do so at work and other people at the seaside. In short, Mr. Campbell, like the rest of us, is for the most part a creature of custom.

Personality and Culture.—The influence of culture upon the members of a society is not restricted to the sort of things we have mentioned above: to food, clothing, and etiquette. It is now certain that human personality itself results in large measure from the interaction between biological inheritance and the particular culture into which the individual happens to have been born; personality is the subjective aspect of culture. Psychologists are all in agreement, whatever the nature of their other differences, that the personality is created in the first five years of life as the result of parental training, and this training, it is clear, is strongly influenced by the attitudes which society inpresses upon the parents.

Patterns of Conduct.—If we take the usual analogy of the clay, the potter, and the design, then it will be seen that the newborn child (the clay) is modelled by the parents (the potter), not at random, but according to the approved pattern of a particular society (the design). Everyone, into whatever society he is born, is brought up to have specific attitudes to women or men, to sexual relations, to cleanliness, to aggressiveness, and to competition, and these attitudes are unique to each society at any given time. Most middle-class Englishmen feel that they ought to "get on" and have ambitions, that one should not strike a woman, that one ought to have a daily bath, and that it is rude to argue in public with shopkeepers, waiters, and public servants. Frenchmen and Italians have no such inhibitions about arguing in public, and Americans have a much stronger desire to succeed. Such differences in national or class character may often cause difficulties through misunderstanding. For example, the average British worker attaches more importance to sticking together with his mates than to getting

on, and he rather despises the middle-class attitude that one must succeed at all costs, regardless of whom one has to overcome in order to get there. Then the average American is brought up to feel that when he has made more money than someone else, he should be proud of his achievement and make no secret of his opulence, however temporary, while on the other hand the Englishman feels that it is impolite to discuss money or speak of one's achievements. Therefore to the American the Englishman is a queer, reticent, and "stodgy" individual; to the Englishman the American is noisy and boastful. Neither accusation is true—both are judging each other in terms of how they have been taught people ought to behave. Dr. Margaret Mead, investigating the problems arising from the relationships between American Servicemen and English girls during the last war, pointed out that American men are brought up to be assertive in their attitude to women, to ask for more than they expect to receive—an attitude which is perfectly understood by American women, but not by the English, who, used to a more cautious approach, take it as indicating more than was actually intended. Both sides were equally shocked at the "immorality" of the other, the Americans at the readiness of English girls to yield, the English at the assertiveness of the Americans in sexual matters.

Interaction of Group Influences.—Although we have so far spoken of the national character of such large groups as the British, American, French, and Italians, it is obvious that when dealing with groups of this size composed of many subgroups, the resulting picture will be far from clear. Our Mr. Campbell is, to the foreigner, simply "British," but he is, as we have seen, also a Scot, a Protestant, a member of the working-class, and a miner. So, although he shows many traits which are "British" in the widest sense, he differs in obvious ways from another Britisher who was born in London, is of the middle-class, belongs to the Church of England, and works as an accountant. It is not only national, but also regional, religious, class, and occupational groups which influence personality, and there are other factors also at work which we must shortly discuss. Before doing so, however, we must mention some important researches into the relationship between personality and culture in more primitive peoples, where the picture, for various reasons, is much clearer. Primitive peoples are more suited to anthropological studies, because, in the first place, they can be separated into small tribal communities which are, for the most part, not subdivided into regional, class, or religious subgroups. Secondly, they are much less subject to social change (for reasons which will later be made clear), and have remained closely integrated, undivided, and in varying degrees static for considerable periods of time. The people belonging to these groups are not nearly so individual in their outlook as most of the people we are accustomed to; for the strongly individualist character is typically a product of the large society with many subgroups. The member of a tribal community is more at the mercy of public opinion than the member of a large industrial nation with its many subgroups within which the eccentric, the brilliant, or the perverse can find themselves at home. In the small community (and this applies even in this country to the small village community) conformity to the rules is much more strictly enforced, and, as Professor Harding has pointed out, it is the multi-group modern society which is the basis for personal freedom. As we have suggested, this is because the non-conformist in the small homogeneous community is at a serious disadvantage in that he lacks the support of minority groups and courts disapproval which, in such circumstances, may be a real threat to livelihood and happiness.

Primitive Tribes.—Ruth Benedict and Margaret Mead carried out anthropological surveys of many primitive tribes in the South Sea Islands, New Guinea, and Central America, with results which are of the first importance to anyone who wishes to understand human nature. They show, in particular, the immense influence of cultural factors in moulding personality, and demonstrate clearly how many traits which Europeans all too readily assume to be part of basic human nature are not "natural" at all. In Samoa, for example, young girls pass through adolescence without any of the "storm and stress" accepted as inevitable in the West. In New Guinea, amongst tribes living in neighbouring areas and belonging to identical racial groups, Dr. Mead found that characteristics of men and women believed to be fundamental in Europe were often radically altered. In the Arapesh tribe, both men and women are mild and gentle; in the Mundugumor, both sexes are violent and aggressive; and amongst the third tribe, the Tchambuli, the "normal" sex-attitudes are completely reversed. Tchambuli women are dominant, managing, and impersonal, whilst the men are "flighty," less responsible, and emotionally dependent. There can be little doubt that many of the traits believed by Europeans and Americans to be definitely feminine or masculine are not biologically but culturally determined. Amongst the Zuni Indians of New Mexico, Ruth Benedict found a people who were gentle, non-aggressive, and non-competitive to a degree quite unknown in industrialised countries. The Zuni *try* to lose races, try not to be superior to others, have nothing but contempt for those who wish power and authority, and would have no chiefs at all were it not that certain individuals are compelled to assume chieftainship under threat of imprisonment. On the other hand, the Mundugumor of New Guinea far outdo the industrial West in competitive spirit, aggressiveness, and in their dominant attitude of "each man for himself and devil take the hindmost." The Kwakiutl Indians of Puget Sound, unlike ourselves, spend all their time giving away wealth instead of accumulating it; at their cermonial feasts or *potlatches* they tear up money and compete with each other as to who can burn or otherwise destroy most of their riches. The Dobu, another New Guinea tribe, are so suspicious that, were a Dobuan transported to England, he would probably be certified as suffering from persecution mania—yet this trait is "normal" within that community. In Bali, the "normal" attitude, says Dr. Roheim, is one which elsewhere would be regarded as schizophrenic; for there, "we have that unthinkable thing, a schizophrenic culture." Yet every one of these traits is acquired by the individual during childhood—and, indeed, Dr. Mead has shown how varying methods of child-rearing lead to the results observed in the adults of a culture. "Systems of child-training," writes Erik Erikson, "represent unconscious attempts at creating out of human raw material that configuration of attitudes which is (or once was) the optimum under the tribe's particular natural conditions and economic-historic necessities."

Summary.—From these recent observations and researches we may make the following deductions:

(1) That the culture of any society represents an attempt to adjust to a particular environment, using the word in the widest sense to imply not only the physical environment, its raw materials, and climate, but also the past traditions of the society, its technology, and so on. We can see, for example, how American history, with its background of an expanding frontier and its awareness of having escaped from the old traditionalist societies of Europe, has strongly influenced American national character. Similarly, the glorification of "free enterprise" amongst the English middle classes, and the equal and opposite insistence upon collective action amongst the working classes, are both the result of historical necessities. In the processes of bringing up families parents hand on these attitudes to their children.

(2) Human nature is more adaptable than has hitherto been thought. It is *not* "natural" to want money, to compete, to have ambitions, to be warlike, nor for that matter, to be gentle, non-aggressive, and non-competitive. Women are not naturally "feminine," maternal, and dependent, nor men "masculine," assertive, and independent.

All these traits are acquired by learning and growing up in a particular culture. There is, in short, no such thing as a "fundamental human nature."

(3) Human beings have no "instincts" as is the case with animals; all one finds in the infant at birth are certain *drives* or *needs*—the need to eat, to drink, to excrete, to be protected from the rigours of climate, the beginnings of sexual needs, and so on. One need, however, although not strictly speaking innate, is universal because of the inevitable fact of dependency in childhood: this is the need for approval or, in the widest sense, love. As Ruth Benedict has said: "Man is a highly gregarious animal and he always wants the approval of his fellows. First, of course, he has to get the means of keeping alive, but after that he will try to get approval in forms which his society recognises. His society may recognise conquest, and he will engage in conquest; it may recognise wealth, and he will measure success by dollars and cents; it may recognise caste, and he will behave in all things according to the position to which he was born."

(4) Without socialisation, without parental upbringing, human beings could not become anything at all. There is no such thing as the "natural" individual, the "noble savage" of Rousseau. In the few reported cases where a child has survived without any sort of attention other than receiving food and drink it has not been appreciably different from one of the higher apes. One child of eight years born of a deaf and dumb mother and reared in an attic in complete seclusion from other people, could not even appreciate sound. It had been accustomed by its mother's deafness to ignore noises, and even the loudest sound produced no reaction, although the ears were quite normal.

Most of a person's actions, therefore, are carried out either to satisfy the innate biological drives mentioned above, or to satisfy the deep-seated, universal, although probably not innate need for emotional security and approval. Men seek wealth, position, knowledge and so on, not out of a primary desire for these things, but because they are the roads to approval within the frame-work of a given society.

Individual Differences.—Now, as we can readily observe, individuals differ quite considerably from each other, even within the same social group, so we must now consider what factors give rise to the individual variations upon the theme set by culture; several, in fact, have already been mentioned. These are, the subgroups to which the individual belongs, his status and role, and his particular upbringing and inheritance. Social change, too, gradually brings about changes in the "basic personality type" of a society, as, for example, the changes in attitude which took place between Elizabethan and Victorian times and have already been mentioned.

1. *The Influence of Subgroups* in bringing about particular attitudes in the individual has already been discussed, and need not be further elaborated here.

2. *Status and Role.*—An individual's status is his position in society, not only in respect of social class, but also in occupational, marital, professional, and other spheres. His role is the behaviour which is associated in that society with a given status. Perhaps these concepts are most simply explained if we regard social life as a sort of stage-play in which each individual is an actor in particular roles: a parson has to act as a parson, a doctor as a doctor, a father as a father, and a manager as a manager. Parsons are expected to talk and dress in a particular manner, fathers to behave in a certain way (which differs in each society), and although every parson or father is an individual in his own right, many of his acts can be understood only when we realise that he is acting in the way society expects of parsons and fathers. When people break these unwritten rules, difficulties may arise. There is no law which says that a parson may not play the saxophone, but one who did would be looked on somewhat askance by his parishioners, and, although patients sometimes complain that their physician puts on an exaggerated "bed-side manner," they are often even more distressed when he does not. Gordon Rattray Taylor tells of a factory manager who went about in a shabby old car, and who, far from being thought endearing and democratic for doing so, was regarded with disapproval by his employees, who felt that he was "letting down the side" by not behaving in a manner appropriate to his position. This is what is described as "*formal status*," since managers, parsons, fathers, and so on occupy formal positions recognised by society as at present constituted. There is also *informal* status—that is to say, the type of status allotted to individuals in a small and intimate group such as the working group in the factory. For example, we have George, who is the one who defies management and takes the lead when complaints are to be made; Alf, the one who tells dubious funny stories; Bill, the one who knows all about First Aid; and Harry, the amiable idiot who is always teased by group members but protected from the jibes of the members of other groups. All these individuals have been allotted a certain informal status, and are supposed to act "in character," although each man in another group may play a quite different role. Alf, the joker, may be henpecked at home—a sad little man; Bill, the knowledgeable First Aider, may be a very insignificant member of the local St. John's Ambulance Brigade, to whom he may be the "silly ass"; George, the resentful, may be the kindly father. But within each group their roles are fixed and difficult to evade. Status and role, therefore, have a powerful influence upon behaviour.

3. *Differences due to Upbringing and Heredity.*—Although we have already indicated that the influence of heredity, so far as personality is concerned, has been grossly exaggerated, it does indeed play some part. What is inherited, however, is not specific behaviour but temperament, and temperamental differences, being based on glandular and structural nervous factors, are fairly permanent features of the personality. By and large, upbringing determines *what* we do, temperament *how* we do it. Hippocrates, the ancient Greek "Father of Medicine," suggested that temperaments could be divided into the choleric, the phlegmatic, the sanguine, and the melancholic, and at least one modern psychologist uses the same terminology, so we may fairly safely assume that whether a person is quick and passionate, slow and phlegmatic, quiet and pessimistic, or cheerful and hopeful in his actions these are temperamental traits which, however much they may be modified by training, are basically inherited.

But clearly the most important differences between one individual and another in the same culture arise from the vagaries of upbringing; for, even apart from such accidents of fate as the loss of one or both parents, illness in childhood, and natural calamities, the obvious fact is that no parents ever pass on the cultural design to their children without many individual variations. If we picture the cultural design as a rough mould which supplies the main outlines of the pattern, we can also picture the parents as adding individual touches of their own (whether knowingly or otherwise) to a material which already varies for biological reasons. At this point it is necessary to say something of the work of Freud, for it is he who has given us some of our closest insights into what one might describe as the microscopic anatomy of the individual personality. Unfortunately to do so is by no means easy because Freudian theory is extremely complex, and has, furthermore, been considerably modified by later writers of the psycho-analytic school. What is given here must be taken only as a very rough outline of what Freud and later psycho-analysts have been trying to say.

FREUDIAN THEORY

The newborn child is a young animal, with no morals or sense of reality and no "instincts" as we understand the term in the lower animals. It has only two great drives which Freud takes

to be fundamental—sex and aggression. Although Freud described sex and aggression as "instincts," the word is nowadays reserved for a particular form of behaviour which, if it exists at all in man, is certainly a dying category—it should be used solely for behaviour which is inborn, relatively fixed, and automatic. Ants, bees, and wasps, for example, carry out the most detailed acts: nest-building, caring for the grubs, or food-collecting and storing; but there can be no doubt at all that none of these acts are in any way intelligent. They are based on the insect's nervous structure, and could not occur otherwise than they do. Amongst the higher animals, the birds and mammals, such instinctual behaviour comes to be increasingly modified by intelligence, but it is only in man that intelligence assumes its full significance, and all behaviour is modifiable and no longer automatic. The drives of sex and aggression in man do not involve any elaborate type of fixed behaviour pattern; they are simply the raw material of action, to be modified in many different ways as the child learns from its parents and others. Briefly, all animals in varying degrees (more so in the lower animals, less so amongst the higher) are like tram-cars moving upon fixed rails, and however complex the route they take, it is largely what has been laid down from the beginning. Human beings, on the other hand, are like motor cars, which, although making use of the same source of energy as the animals, can utilise it to drive where they please.

Sex.—Freud used the word sex in a rather specialised sense to apply, not only to sexual behaviour in the ordinary meaning of the word, but also to such behaviour as eating and drinking, excretion, and, at a higher level, to love and friendship. It might almost be said that in Freudian terminology sex and aggression are words used to describe the two poles of desire, positive (love, lust, hunger, longing, wanting) and negative (hating, fearing, avoiding, killing, getting rid of things).

The Id.—The problem of society is to modify this primitive creature which can only need and desire, hate or fear, want pleasure and avoid pain, into a civilised being, and this is the problem it delegates to the parents, who, in the long run, utilise the child's need for security or protection and care to compel it to act in approved ways. The baby learns, by imitation, by trial and error, by punishment or the threat of punishment, by love or fear of the loss of love, to conform more or less to social standards. The primitive aspect of the mind, which includes not only the innate drives of sex and aggression but also all those thoughts and emotions which, in the course of development, the individual comes to accept as forbidden, is described as the Id, and just because it contains this sort of material, thoughts and emotions within it become or remain unconscious.

When the infant is born, its mind is all Id, but sooner or later the child is confronted by stern reality when it comes to realise that desires are not satisfied automatically. Sometimes it is hungry and food is not forthcoming, sometimes it is wet and uncomfortable and has to wait to be "changed"—all these events occur even to the most fortunate baby.

The Ego.—So a part of the mind comes to be separated off from the primitive Id, whose function it is to deal with reality, and this part is known as the Ego—the conscious mind as we know it in adult life. The basic function of the Ego is to deal with life as it really is, not as we should like it to be.

The Superego.—Still later, perhaps about the age of three or four, the child is faced by another problem; for it has to start conforming to the ethical dictates of society, to what is ordinarily described as the moral code. It has to learn what is done and what must not be done, and so a further division in the mind takes place and part of the mind begins to specialise in moral control. This part is known as the Superego. The Superego arises in two distinct stages—firstly, the child comes to realise that, under penalty of punishment or disapproval, it must obey its parents; at this stage, then, compulsion comes from outside. Later, however, the child by a process of what Freud describes as "introjection" takes the parental standards within itself. One part of the mind, as it were, plays the role of the moral parent in relation to the rest. This is the fully-fledged Superego.

Character.—An individual's character is the result of a three-cornered struggle between the primitive biological drives (represented by the Id), the hard facts of reality (represented by the Ego), and the moral dictates of society (represented by the Superego). The Superego is the censor which forbids thoughts or actions not allowed by society or, more accurately, thoughts or actions which were forbidden by the parents in early childhood. As one writer says, the Superego is a sort of psychological gyroscope which places control within the mind and avoids, in varying degrees, the need for outward compulsion. When the dictates of the Superego are transgressed the individual has a sense of guilt and feels himself more or less a social outcast.

Expression of Primitive Impulses.—But the primitive drives are very powerful and cannot be totally repressed—they demand some sort of outlet, and are given it on condition that they are suitably modified or appear in socially acceptable forms or at least at socially acceptable times. Most societies, for example, permit the expression of primitive emotion at certain periods or under certain conditions; the sexual drive is permitted expression in marriage, and naked aggression in warfare. But more often the drives have to be modified by one or other of two fundamental mechanisms known as reaction formation and sublimation. In the case of reaction formation the energy of the forbidden impulse is utilised in emphasising its opposite; it is as if the individual were saying: "Of course I don't have such wicked desires—you can see I am quite another sort of person." Perhaps this mechanism will become clearer if we give some examples.

(1) Even the layman is aware that people who are excessively puritanical are frequently by their very puritanism demonstrating quite the contrary aspects of their character. We laugh at the elderly lady who is afraid of finding a man under her bed precisely because we are aware consciously or unconsciously, that she would not have the fear if she did not also have the hope. Similarly, when we read in the papers of a gentleman who so disapproves of obscene books or magazines that he buys hundreds of them to find out whether they are suitable or not for others to read, we may suspect that his own motives are not entirely devoid of suspicion. In short, the character-trait of puritanism is sometimes a reaction formation against strong sexual desires; the individual is fighting in the outer world the very problem he is unable to deal with in his own mind.

(2) The above examples are fairly obvious to the normal individual, who has little difficulty in observing them in his own surroundings, but it is less often realised that aggression may be modified in the same way. Some people, in other words, are compulsively gentle, non-assertive, and disposed to hate cruelty precisely because they are so full of aggression themselves. (This does not mean to imply that there are no genuinely pure or gentle people, but merely that many supposedly pure and gentle people are really quite the opposite.) When, for example, someone tells us that he would flog a man who illtreats a horse, it is obvious that, whatever else he may be, he is not basically gentle. This is an extremely important problem; for if gentleness and kindness sometimes arise, not from a genuine love of all living things, but from fear of one's own

aggressiveness, then sooner or later the real motive will become evident.

The second method of dealing with primitive impulses is by sublimation—that is to say, by making them socially useful. A butcher, a surgeon, or a prize-fighter are all expressing in modified form their latent sadism, but in a way which is recognised by society. Women who have wanted children and failed to have them may become teachers, helpers in nursery schools, and so on in a valuable attempt to satisfy a frustrated need. If Freud is correct, the frustrated sexual curiosity of childhood may later take the form of a desire to know, causing the individual to become a scientist or a bookworm. Art, sculpture, and painting may all be sublimations of the infant's natural dirtiness and pleasure in messing about with mud, water, or even its own excretions. The reader may or may not accept these latter assumptions, but it is only fair to say that those who are in a position to know have found a great deal to support Freud's theories.

Mental Mechanisms.—Even in adult life the individual's adjustment to reality—the "hard facts of life"—and to moral problems is never complete, and self-deception is common. In this connection Freud describes various mental mechanisms which even those who do not accept the Freudian theory in its entirety have found valuable in understanding human behaviour. We will conclude, therefore, by describing some of these forms of self-deception here and giving examples of their influence upon human behaviour.

1. *Displacement.*—An emotion, when conditions do not permit its being directed towards a particular object, may be directed against another which originally had nothing to do with it. "Love on the rebound" is an example of this in which, when the original object of love has disappeared, another is quickly found, not because of any real qualities possessed by the new object, but rather because the emotion demands some outlet. Aggression, too, is very often displaced: for instance, an employee, angered by his foreman or boss, but unable for obvious reasons to retort in kind, may quarrel with his wife over some triviality when he gets home. In Nazi Germany Hitler permitted the displacement of economic and other resentments felt by the Germans after the Treaty of Versailles on to the Jews and Communists, who were thus made scapegoats for the convenience of the Nazi party. It is important to understand that this is one of the commonest types of mental mechanism which is universally, although unconsciously, used by us all.

2. *Projection.*—This is an example of a mechanism which has already been demonstrated. In brief, it means the tendency to project the objectionable qualities we refuse to recognise in ourselves upon others. "It is not I but he who is thinking and doing these wicked things." Thus, as we have seen, people who will not admit to their own impure thoughts accuse others of possessing them; those who are aggressive believe that everybody else but themselves are aggressive; the greedy accuse others of greed, and so on. Carried to an extreme degree, this is the mechanism behind persecution mania or paranoia, as the psychiatrist calls it. Projection is another very important trick of the mind, and its social effects are often all too evident.

3. *Compensation.*—Alfred Adler, one of Freud's pupils who later founded a separate system of psychology, was the first to draw attention to this important mechanism.

Briefly, Adler pointed out that those who suffer from a deep-seated sense of inferiority (whether due to physical or mental defects or to lack of affection in childhood) have a strong tendency to compensate for this either by overcoming the actual defect or by becoming superior in some other field.

Wherever we look we can see examples of this mechanism; Sandow the strong man and many other athletes have been puny and weak in childhood, many individuals with speech defects have made themselves into great orators, many musicians or composers (Beethoven, for example) have been deaf, and many famous painters have had defective eyesight. These forms of compensation are harmless and even useful, but it is quite otherwise in those cases where inferior individuals try to obtain superiority by gaining power over others. It is significant that Hitler, Mussolini, Napoleon, and many other delinquent types who have made a nuisance of themselves to a long-suffering world, were all men of below normal stature who felt their inferiority keenly. Another interesting observation is the fact that many of those who have attained eminence in a particular nation have not been members of the nation they aspired to rule or fight for, but were members of what was regarded as an inferior national group. Napoleon was, of course, an Italian born in Corsica; Hitler, an Austrian born at Braunau near the German frontier; Stalin, a Georgian; a large number of English generals, Irish or Scots; de Valera, an American, and so on. The significant thing about power-seekers is that they naturally tend to go where power rests; hence we find many of them becoming turncoats in a crisis. William Joyce, better known as "Lord Haw-haw," was an Irishman whose early passion in youth was to be a loyal Englishman and an officer in the British Army; when he felt himself rejected he turned to the Germans, who were ready to accept his services as a traitor. Not a few working-class politicians have, as they progressed up the social tree, become more and more conservative in their outlook; Saul the persecutor of Christians became Paul the Christian leader, and Mussolini the socialist, a fascist.

In a free society one of the problems we have seriously to consider is the possibility that those who win in the scramble for power tend to be the unbalanced people who need it because of the power-loving drive based upon an inferiority complex.

4. *Rationalisation.*—This, as Bradley said of philosophy, is "the giving of bad reasons for what we do upon impulse." Nowadays, for example, nobody ever goes to war in order to kill a lot of people or take their country from them; they go to war for the other nation's own good—because they want to help them. Criminals are hanged, not because we as citizens are at a primitive stage of development which still demands "an eye for an eye and a tooth for a tooth," but because "hanging prevents further crimes" (of course, there is excellent evidence to show that it does not). Rationalisation is too familiar to most of us to need further discussion.

5. *Conversion.*—This is the mechanism which most people find it least easy to understand. Whereas the other mechanisms are, in their milder forms at least, almost normal, conversion is always abnormal, and implies more or less serious disturbance of the mind. There are two types of conversion: hysterical and psychosomatic.

In the first case, a state of mental conflict produces symptoms of physical disorder which, however, are not due to any underlying physical disease. Such cases may show symptoms of blindness, deafness, complete or partial paralysis of the limbs, double personality, or loss of memory, all of which can be shown to be purely psychological in origin, and, in fact, occur because the individual in some sense does not want to be able to walk, see, hear, or remember. In short, the symptom occurs because it gets the individual out of some difficulty which he is facing at that particular period. A very simple example of this is the so-called "writer's cramp," in which someone whose job depends upon his ability to write suddenly finds that he cannot write at all; whenever he attempts to do so, his hand muscles go into a state of spasm. An actual case of this sort which shows the underlying mechanism may be quoted from Dr. J. A. C. Brown's *The Distressed Mind*: "A spoilt 'mother's darling' of a man was working as a clerk in a recruiting office before the war. He had got the job with difficulty and was the only support of his mother. In the office were several N.C.O.s who shocked him constantly by their obscenity. He hated the work, and yet felt that it would be unfair to his mother to give it up. One day he found that his

hand would not work and whenever he tried to write, it went into painful cramp and the muscles became rigid. He had solved his conflict by falling ill, as he could then evade his work and, at the same time, feel he had done his duty to his mother. He was, of course, unaware of the cause of his trouble." Such cases are (although this is somewhat of an over-simplification) a sort of unconscious malingering in which the individual solves a mental conflict by developing symptoms which remove him from the difficulty, at least temporarily. Again, a neglected wife who feels herself starved of affection may develop a vague and unspecified sickness which takes her to bed, there to be fussed over and given the attention which she had lacked when behaving normally. Such people, of course, really feel the symptoms they complain of, and their blindness, lameness, and so on are just as much " there " as they would be in a hypnotised person; in fact, it is not incorrect to say that such people are self-hypnotised. They certainly require psychological treatment.

6. *Psychosomatic Conversion.*—Psychosomatic conversion is a very different state of affairs; for, whereas the cases we have so far discussed have been those who had lost the *will*, and thus the ability, to carry out certain physical or mental functions, people with psychosomatic disorders suffer from actual physical disease as a direct result of mental stress. Within their bodies actual physical damage has resulted from prolonged exposure to emotional tensions. Elsewhere something has been said about the autonomic nervous system which prepares the organism for relaxation or emergency, and we saw that, when one of the higher vertebrates finds itself in a threatening situation the sympathetic division of the autonomic nervous system is stimulated, producing changes which are useful in fight or flight For example, extra sugar secreted into the blood-stream from the stores in the liver is necessary for the fighting or escaping animal as emergency fuel; removal of blood from the internal organs to the muscles, a rise in blood-pressure, and cessation of digestion are similarly useful; and dilated pupils, erect hair on the back of the neck (in dogs and cats, for instance), or tense muscles all serve various functions in aiding clear vision, scaring the enemy, and preparing for blows or for running. But human beings differ from animals, (*a*) in that they are scared or made angry by things which are no real danger to life but only to self-respect (*e.g.*, sitting an examination, snubs, or imagined insults), and (*b*) in that, unlike animals for whom out of sight is out of mind, man is cursed with imagination and memory which keep his emotions alive for long periods of time. In this way it happens that bodily changes produced by sympathetic stimulation in a time of crisis may continue, not for minutes, but for years. The frustrated worker, hating his job and resenting his boss, has the raised blood-pressure normal to the angry animal; but it continues day in and day out until his arteries become thickened and the pressure can no longer return to normal. The ambitious business-man, mentally on the attack for years at a time perpetuates the associated physical changes normal to an attitude of attack; his stomach-wall is drained of proper blood-supply and the digestive juices, ordinarily neutralised by anti-enzymes in the blood, digest the lining of the stomach itself, causing an ulcer. Chronic states of anxiety or excitement may cause the thyroid gland perpetually to overact, leading to exophthalmic goitre. Muscle tensions appropriate to aggressive attitudes when prolonged may in others lead to fibrositis and rheumatoid arthritis. The changes produced by emotional states in the skin may cause skin disease, and migraine, asthma, angina pectoris, and coronary thrombosis are other diseases of varying degrees of severity due basically to fear, insecurity, and hate. Of course, what has been said here is inevitably over-simplified; for no disease is due to a single cause, nor is it at all clear why one patient gets one type of psychosomatic disease and a second another. But there can be no doubt that the outlook in medicine has become revolutionised by these discoveries, and can never return to the old mechanistic views of the nineteenth century.

In summary, this is how views have altered:

(a) To a considerable extent we must discard the old view that sickness is always something that happens to an unsuspecting individual, like being hit on the head by a falling slate. Patients usually go to a doctor in much the same frame of mind as they would go to a watch-maker—" Here, there's something wrong with this watch—what are *you* going to do about it? " But from now on it has to be realised that the patient and the illness are one, that it is because he is the sort of person he is that he has become ill in a particular way. It is quite literally true that today we are entering a stage in the development of medicine which will look on crime as social or mental sickness and much disease as the result of the individual's wrong attitude to life.

(b) There are, of course, diseases in which psychological factors are at a minimum so far as causation is concerned, although psychological factors always play a major part in determining the course of the disease. Smallpox, malaria, cholera, natural calamities (like the slate falling on our unsuspecting head), and diseases due to malnutrition (where food has not been available) are examples of such conditions. These are the diseases which are serious problems in the more backward areas of the world, and are, on the whole, less important in the civilised areas. Psychosomatic factors, however, play a considerable part, in the case of the less-virulent infectious diseases, in determining whether the patient succumbs to the infection or not. For example, Dr. Wittkower has shown that psychological factors play a large part in determining resistance to tuberculosis and the subsequent course of the disease. Sir William Osler, the great physician, used to say of tuberculosis that what the patient has in his head is more important than what he has in his chest. The psychosomatic diseases already mentioned and the neuroses are, of course, examples in which the psychological factor is at a maximum.

(c) Fear and hate or anxiety not only cause unhappiness but also sickness and death. Hate and fear can kill.

(d) The psychosomatic diseases and the mental disorders generally are social diseases. They are strongly influenced by the stress of modern life and are on the increase. The present position is that, as Dr. J. L. Halliday has shown in his *Psychosocial Medicine*, although such diseases as smallpox, typhoid, rickets, the conditions due to dirt, faulty hygiene, and malnutrition, are well on the way to disappearing in the more advanced communities, *in these very same communities* the rate of neurosis, gastric and duodenal ulcer, heart disease, glandular diseases, high blood-pressure, suicide, infertility, and delinquency is going rapidly up. It is not only going up, but the diseases are attacking younger and younger people in each generation. As an example showing the relationship between social stress and psychosomatic disease we might point to high blood-pressure, which is even more frequent amongst the Negro population of the United States than amongst the Whites (who have probably the highest rate in the world), whereas primitive Negro tribes in Africa do not suffer from this condition at all.

(e) Finally, mention must be made of the body–mind problem which these observations bring to the fore. Ultimately, of course, this problem is a philosophical one which cannot be decided by observation or experiment, but today psychologists and doctors are inclined to make use of the working hypothesis that body and mind are one—that " mind " is only a useful word to refer to certain processes occuring in the body. Curiously enough, it was the mechanistic outlook of science which necessitated the hypothesis of a separate mind; for, if we begin by assuming that the body is a machine (which it is not), then we require some explanation for the fact that it sometimes acts as if it were something else. It must be realised that living things are not dead matter *plus* something else—they are simply living things with their own laws which cannot be described in the same terminology as those of physics and chemistry. Each of the spheres we have dis-

cussed—the inorganic, the biological, and the social, have their own laws, and one cannot be fully described in terms of the other. Scientists have discarded the mechanistic view, which implied that the whole was nothing but the sum of its parts and that we could best know the whole by studying each of the parts separately and then adding up our impressions, but they have not necessarily discarded materialism. This, however, will be discussed at a later stage.

SOCIAL CHANGE.

We have already seen that the culture of a society—that is to say, its way of life—results from the interaction of many different influences. The physical environment obviously plays a considerable part and when we consider the differences between tribes living in hot, and those living in cold, climates, it is evident that, to some extent, their way of life is a form of adaptation to the physical surroundings. A second factor is the past traditions of the tribe; as we saw in the case of the New Guinea tribes, societies can live in the same surroundings and be of the same stock biologically, and yet differ widely in their usages. What is different is the past history and traditions of the tribes. Similarly, we can see that many industrialised countries at the same level of material culture and living in very similar environmental conditions, can vary considerably in their outlook on life. But here we have to ask ourselves the important question: what brings about cultural change? Why, for instance, did the Englishmen of medieval times differ so greatly in their culture from the Victorian or present-day ones? Many sociologists believe that new technical developments (inventions) have played a major part in initiating social change, and in the case of Europe perhaps the most important factor has been the discovery of the steam-engine.

Mediaeval Culture.—Society in the Middle Ages in Europe was relatively static, so that there was less change in two centuries than in twenty years in our own times. People lived in small village communities, and in their whole lives might never move more than five or ten miles from the place where they were born. They lived on the land, and their main sources of power were wind and water. Under such circumstances, industry, for the most part, was on a very small scale, and was carried out in the home of the craftsman, who was aided by his apprentices. Society was arranged in a hierarchy, with the king at the top, then the barons and lords, then the priests, the merchants, the soldiers, and the commoners; each individual was born into a certain level of society, and there he was destined to stay (although in the priesthood some promotion did occur). Learning was something one acquired from the books of the great writers of the past, and especially the great Greek and Roman writers and the Fathers of the Church; astronomy, medicine, and biology, not to mention philosophy and theology, were learned from these authorities, and nobody ever thought of studying nature itself to verify the conclusions reached by Plato and Aristotle 1,500 years earlier. Yet within this hierarchy there was a certain spirit of democracy—for men were regarded as equal in the eyes of God, and the usual analogy by which the state was described was that of the human body, in which each part has a function to play in relation to the whole. In economic affairs usury was forbidden, (*i.e.*, the lending of money for interest), and the price of goods was determined by what was known as the "just price"—that is to say, a price which seemed to bear some relation to the intrinsic value of the goods. Poverty was regarded as inevitable, but, so far from feeling that the poor should be ashamed of their state, it was thought that the poor were especially close to God. It should not be supposed that the Middle Ages were as ideal as some writers, such as Belloc and Chesterton, have made out—there was dirt, malnutrition, plagues, and discomfort; but there was also great literature, great architecture, and great philosophy. Above all, people living in these small communities could feel that sense of belonging which we have seen to be so important. Families were large, grandparents lived as an integral part of the household, and illegitimate children (then more kindly called "natural" children) were looked after along with the rest. The Church and those who were better-off took care of the poorer, for charity was a religious duty. There was, in fact, during the early Middle Ages, no such thing as a Poor Law—partly, at least, because it was unnecessary.

The Influence of the Steam-engine in England.—The steam-engine has really quite a long history, beginning with the very elementary type devised by Hero of Alexandria several hundred years B.C. But in a form which was capable of being put to practical use, it dates from Watt's invention in the middle of the eighteenth century. To begin with, the use of the steam-engine as a source of power had five implications; (1) that the use of man-power was increasingly superseded by the use of steam power, and, of course, water and wind-power were gradually given up; (2) that wood was no longer used as a fuel, and less and less as a construction material; (3) that industry tended to congregate where there was an adequate coal supply, namely in the North and West of England; (4) that foods began to be produced in ever-increasing quantities; (5) that men and women were required to tend the machines and to do work in which craftsmanship was of little importance, and large numbers of workers were needed. A steam-engine and the rest of the equipment necessary to start a factory were expensive both to buy and to run, and individual ownership had to give way to joint-stock companies managing large amounts of capital. In these ways there arose the "dark satanic mills" situated mainly in the coal-bearing North, and craftsmen and agricultural workers from the "deserted villages" such as the one described by Goldsmith, flocked to the new towns, there to live under conditions of incredible filth, disease, and misery. This, of course, was the beginning of what we now know as the Industrial Revolution.

Changes in Social Institutions and Beliefs.—The vast majority of sociologists have taken the view that social change in the psychological and moral spheres is based upon changes in the material culture due to inventions and discoveries which alter the character of the powers of production; These inventions may reach a society by spread from another culture or by the scientific discoveries of its own men of science. What, in effect, this theory implies is the following: (1) the most important thing to a society is its means of livelihood and its methods of production; (2) it will, therefore, tend to organise its social structure around its means of production, and its most important men will be those expert in that field; (3) it will also tend to organise its thoughts and even its religion and philosophy and science with a bias in favour of the outlook of its most important men—those who own the means of production.

Wherever modern industry goes, it modifies the existing institutions of a society and brings about social change, just as it did in our own country. In China the large peasant family is gradually disappearing as industry spreads, in India the caste system is breaking down (since one cannot bother about caste differences at a factory bench), the other-worldly religions like Buddhism come to mean less, the birth-rate gradually (if too slowly) goes down, the growing cities resulting from industrial expansion necessitate the giving-up of traditional attitudes in many things, notably in the field of hygiene and public health. It is, therefore, primarily invention and the spread of inventions that brings about social change.

The Theory of Cultural Lag.—Dr. W. F. Ogburn of the University of Chicago has made a special study of the technological basis of social change and has pointed out two facts which are of primary importance in understanding modern problems. First, there is the fact that, once social change has begun, it goes on at an ever-accelerating rate; each generation learns more, and invents more, than the preceding one because they have more facts and discoveries to work on. A Greek in the third century B.C. could have dreamed of

making steam do work, and as we have seen, Hero of Alexandria invented a very simple engine but in order to make an engine that would really work he would have had to invent by himself: the wheel, the piston, the blast-furnace to produce the temperature necessary for melting and casting iron, the water-wheel to produce the mechanical blast, and so on. All modern discoveries and inventions depend upon pre-existing inventions and discoveries, and therefore the more inventions a society possesses, the more it can make in the future. This is why progress in the technical field goes on at an ever-increasing speed.

Summary.—Now we have noted that social change occurs in three stages: (1) men produce new inventions; (2) these inventions influence human behaviour; and (3) finally, social institutions and beliefs are changed to allow for the new inventions. Recently, for example, a sociologist has shown how in Italy the production at a reasonable price of the "motor-scooter" devised during the war to be dropped in parachute landings has revolutionised the life of the peasants in the areas distant from the large cities. The scooters are cheap enough for the peasants to buy (as motor-cars are not) so that they can now easily travel into the towns from which they were formerly isolated, where they come into contact with city life with the cinema, books, modern "comics" and so on—new ideas which shatter their once simple beliefs. Similarly, the motor car in other countries brought distant places close, revolutionised sexual morals, produced ribbon development, brought about the spread of housing estates beyond the original boundaries of the large cities, led to an entirely new problem as mounting casualty lists resulted from the use of a new machine upon old roads intended for horse traffic. Dr. Ogburn points out that there is always a "cultural lag" between stages (1) and (3), and that this is the cause of many of our modern difficulties. We have vehicles travelling at fifty or more miles an hour on roads intended for horse-traffic, and the daily papers talking of the importance of "private enterprise" and free competition when these have long ago become an impossibility—*not* because of the spread of "socialism," but because businessmen found "private enterprise" and unrestricted competition so unpleasant that they began to form combines and trusts precisely in order to avoid it. In short, the old ways of thinking tend to persist long after the situation which was their justification has changed.

SOCIAL AND PSYCHOLOGICAL PROBLEMS OF MODERN LIFE.

1. Insecurity.—The principal reasons for the psychological insecurity felt by many people today (and also, of course, for the current emphasis upon economic security) arise essentially out of the way of life which displaced the peasant society in medieval times. Medieval society was, as we have seen, closely integrated; each man knew how he should behave and what were his duties and obligations. The earth was the centre of the universe, heaven was above and hell beneath, and through the medium of the Church he knew exactly what he had to do—the world, in a word, was *comprehensible*. In relation to his fellow-men things were equally clear; "Not only civil authority, but God in heaven, had ordained that one be a butcher, a baker, a candlestick-maker, or a villein or serf. From the earliest days of life the individual knew where he stood; he had the security of firm group membership. His father and mother, brothers and sisters, would move neither up, nor down, nor away from him, and the bottom could not drop out of his own world. He had many obligations, but his own rights were likewise well defined. But with vertical mobility came the opportunity not only to rise but to fall, the dispersion of families to seek new adventures in other parts of the world, the loss of group-membership status, and the uncertain compensation offered by a chance to make an individual name for oneself" (Gardner Murphy, *Personality*). By basing its structure upon competition, or, at any rate, upon unrestricted competition, the new way of life cut the individual off from society and set him upon his own two feet; he was now fighting for himself and had to regard the rest of mankind as potential enemies or competitors. The rise of capitalism led to the rise of the isolated individual.

2. Loss of Social Control.—Modern industry demands greater mobility of labour, and modern inventions have made transport cheap and speedy. The small permanent village community of people bound together by primary relationships (whether of love or friendship, resentment or dislike) is therefore broken up, and people become increasingly "rootless." It is as easy for a West Indian worker to come to Britain as it once was for a Scot to move to London. Now, an individual's moral behaviour is controlled: (*a*) by the Superego or conscience acquired in childhood, which is not always effective, partly because it is concerned only with the more fundamental matters, and also because of parental defects in upbringing; (*b*) by the social control of the groups to which the individual belongs—in short, by fear of the opinions or ridicule of others. Amongst the vast majority of people (*b*) is much more important than (*a*) in controlling behaviour. But when people are scattered far and wide, living amongst strangers, the small face-to-face group no longer influences their actions, and their conduct tends to deteriorate; in fact, not only morals but also mental health is strongly influenced by membership of small groups, and in the absence of such membership neurosis becomes more probable. This is why groups of immigrants from other countries present a social problem quite other than the superficial ones which usually cause concern; torn between the old standards which they are rapidly losing, and not yet indoctrinated with the ways of their adopted country, such people are likely to find themselves in difficulties.

3. Social Conflicts.—Society itself, so far from being all of a piece, is riddled with irreconcilable conflicts. One government will encourage "private enterprise," and the succeeding one cheerfully announce that people who engage in private enterprise are scoundrels. We are taught by religion (in the case of America it is stated in the constitution) that "all men are equal," and yet we persecute Negroes and Jews. We are told to "love one another" and in the same voice to "never give a sucker an even break." We stimulate ambition and yet live in a state of affairs in which promotion is increasingly improbable; for example, about thirty years ago it was quite possible (if not as common as might be supposed) for an employee to work his way from the shop-floor to the board of directors. Now, such jobs are increasingly filled by university graduates who have had little to do with manual work. Even in America, once the land of hope, the social classes are tending to become fixed and promotion less likely than before. The cinema depicts people living lives of luxury as a natural state of affairs, and yet we expect people to be uninfluenced by such experiences. An eminent sociologist has pointed out that gambling is the result of stimulating people's desire to achieve wealth whilst failing to devise legitimate means of obtaining it. It is almost always forgotten that frustration is a relative concept—that people are frustrated, not in some absolute sense, but in relation to what they have been led to expect. Thus, miserable as is the lot of many peasants in Asia and elsewhere, they may be much happier than the senior factory manager who expected to be taken on to the board and was passed over. Material goods are important aids to happiness, but in themselves they are not enough; for almost everyone is unhappy, no matter what his possessions, if he feels that what he had is not in accord with what he is entitled to. But what is he entitled to? The plain fact is that in spite of much talk of "fair shares" or a "fair wage," we have no idea what a man is entitled to because it is nothing but a social convention that a doctor should be paid more than a miner, and the old social conventions of this sort, good or bad, have disintegrated.

4. **Racial Conflicts.**—It need hardly be pointed out that this is an increasingly difficult problem which cannot be solved by asserting, no matter how often, that there are no superior races or nations. The real dilemma of such a country as South Africa should not be underestimated, however it may be oversimplified on both sides of the fence; for the fact is that in such a country there are only two possibilities, both of which would lead to equally unpleasant results for the White minority in power. Either (1) they hold the Black peoples down, in which case there will sooner or later be bloody rebellion, or (2) they give the Black peoples equal parliamentary rights, in which case, since the Blacks vastly outnumber the Whites, the ruling minority automatically hand over control to the Blacks. In justice to the White minority, it is only fair to remember that no group in history has ever willingly surrendered power, and that the problem is vastly more difficult than most people realise.

5. **The Problem of War.**—Psycho-analytic writers have always asserted that aggression is an innate drive in man, and therefore that war is inevitable. To this attitude there are three answers; (1) that, if this is so, the human race is irrevocably doomed—for with modern weapons it would be difficult to survive one war, let alone an indefinite series; (2) that it is by no means certain that aggression is innate—most modern psychologists other than psycho-analysts state that aggression is the result of frustration, from which supposition it follows that, although aggression could never be entirely removed, it can be very considerably reduced by removing frustrations as far as possible; (3) that the problem of war has really nothing to do at all with whether aggression is, or is not, innate—what matters is not *whether* we are aggressive, but what we do with our aggression, and war is not at all the most obvious means of getting rid of aggression.

At one time it was thought natural for Scotland to fight England, or, at an even earlier stage, for the various kingdoms into which England was divided, to fight each other. Now such an idea would appear fantastic—not because the Scots learned to love the English, not because morals have improved, but simply because the countries concerned became one world economically and administratively. There can be no doubt that modern discoveries and technology have made it essential for the whole earth to become one economically and administratively—not only essential but inevitable. And, given time, this will quite certainly happen, whether we are willing or not, provided, of course, that we do not blow ourselves up first. When that day comes, we need not bother about the problem of aggression, for, as we have already seen, there are more than enough evils to fight and more than enough problems to tax the best brains for centuries to come, and when we have dealt with these we shall probably find that we have grown up.

6. **Religion and Science.**—In the nineteenth century religion took a good beating from science because it had rashly chosen to discuss matters of scientific fact, such as the theory of evolution. The war between religion and science is over—not, as many people seem to suppose, because one side or the other has won, not because the new scientific theories support religious beliefs (for they certainly do not)—but rather because each has come to realise that their respective spheres of influence are largely separate. The scientist *as* scientist looks at the universe without emotion and as objectively as possible whereas in the sphere of religion we are concerned about how we *feel* towards it. We look on it with awe, fear, or love, as in some sense our home. "Religion," said William James, "is a feeling of being at home in the universe."

No doubt religion is also a great deal more than this, but James' statement contains a fundamental truth, and in this sense we are all religious; for there is nobody living who is capable of regarding the universe with complete impartiality except for relatively brief periods of time, as the scientist does when carrying out an experiment. As we have seen elsewhere, one of man's deepest needs is to have a feeling of emotional security, a sense of belonging, and the consciousness of understanding his relationship to his environment. Erich Fromm, a psychologist who has made a special study of religion, describes the need we have just mentioned as the need for a "frame of orientation and devotion." Whereas Freud considered religion to be a universal neurosis based upon the need to conciliate the father-figure God—a projection of the child's view of its family into the celestial sphere—Fromm reverses this statement and tells us that, on the contrary, neurosis is a private religion. Whereas religion is a public frame of orientation and devotion, each man's neurosis is a private one; or at least, one aspect of a neurosis is the development of a private set of attitudes to life which is in conflict with those of society as a whole. Franz Kafka's novel *The Castle* is a modern parable of the neurotic's isolation from society and life which explains more about the individual's need of a frame of orientation and devotion, and the results of the lack of it than many volumes of psychology.

Summary.—It should be pointed out that in psychology today there are two different points of view which here we have tried to reconcile: (*a*) the psycho-analytic view, which holds that personality is fixed, and is determined in the first four or five years of life, and (*b*) the sociological view that personality, although strongly influenced by these factors, is also influenced by the roles the individual has to play and the situations he has to face in adult life. The views are not necessarily contradictory; what we have to ask ourselves is not whether this view or that, but *how much* of each view, is true. Freud largely ignored the influence of culture, firstly, because all the people he was dealing with belonged to the same culture, and, secondly, because at the time he produced his theories it was assumed that "human nature" was the same all over the world.

Nevertheless, whatever we think of Freud, the one aspect of his work which is beyond doubt is that for most of their lives people are influenced by motives which are unconscious, and of which they are completely unaware. The individual has a picture in his mind of the sort of person he supposes himself to be, and uses the mental mechanisms we have described to maintain this picture; impulses which he cannot reconcile with his ego-ideal are simply rejected. The importance of this fact is evident—for it means that rational persuasion is not nearly so potent in influencing behaviour as has often been supposed.

THE MODERN VIEW OF MAN AND SOCIETY.

There are three types of individual who are in rebellion against society: the neurotic, the criminal, and the genius. The differences between the three are that the neurotic rebels in secret or unconsciously, the criminal openly, and the genius by his creative work is able to sublimate his conflicts in art or literature or even to change society nearer to his heart's desire. (It will be understood that this is a very loose formulation of a very complex problem.)

Now it is the modern view that such conflicts are not private and individual as has hitherto been thought (notably by Freud); for it is the conflicts latent in a particular society which are fought out in sensitive minds. Briefly each society is now regarded as a sort of electro-magnetic field in which the neurotic, the criminal, and the genius are areas of high tension—in them the conflicts suffered by the society as a whole are magnified to the point of breakdown. Whereas, as was realised long ago, such diseases as cholera, typhoid, or smallpox are due to material defects of society in respect of hygiene and the application of medical knowledge, the behaviour of neurotics, criminals and those with psychosomatic disorders is due to cultural defects of the society in the psychological sphere.

Modern psychology and sociology are showing more clearly than ever before that, in the words of Donne, "no man is an island," and that for the misery or unhappiness or badness of the few we are all responsible.

CURRENT SOCIAL PROBLEMS
IN THE LIGHT OF PSYCHOLOGY AND SOCIOLOGY

Some of the major fields in which British and American social scientists have recently interested themselves are the problems raised by our own industrial society. Unlike the industrialism of earlier times, which was a rather haphazard affair, modern industrialism has developed in such a way that the whole society is structured round its needs; we must, we are told, compete in technical advances and productivity with other nations in order to maintain our own high standard of living. Accordingly, education is structured according to social needs instead of to the old-fashioned idea that there is such a thing as a "good" education irrespective of what a man may later wish to do; scientists are attracted by better pay from pure research into industrial technology; people are moving about from one place to another in the interests of industry which also supplies the new aristocracy; and the Welfare State is organised round the problems raised by what the individual can "do." It would be futile to argue the rights or wrongs of this state of affairs because it is here already, but it is wise to see that it raises important issues which, if dealt with rationally, can at any rate mitigate some of our present difficulties which industrialism has brought in its train.

The Main Problems.

Broadly speaking, the four main issues are raised by: (1) education regarded as the *preparation* for work; (2) conditions of work and the problem of the status which work gives both within and without the *working environment*; (3) problems of those who have finally *retired* from work; and (4) difficulties presented by those who have fallen by the wayside in their failure to conform to industrial society—the *delinquents* and the *mentally ill*. Since it would be impossible to deal with all these matters here, only a brief indication can be given of the directions taken by modern social scientists who are studying them.

Education and Intelligence Testing.

It has for long been known that intelligence is an hereditary trait and that, by and large, intelligent parents have intelligent children, stupid parents, dull ones. In the beginning of this century intelligence tests were invented by Binet and Simon working with French schoolchildren and with the wholly admirable intention of separating the dull from the intelligent pupils so that the former would not hold up the work of the class. The tests were arranged in groups of questions which it had been shown were capable of being answered by the majority of children of specific age-groups; thus a normal child of five would be able to answer all the questions in age-group five plus perhaps a few belonging to age-group six. With six questions to a year, each question answered beyond the individual's own age-group counted two months, so if the child answered all his own year's questions plus three more his *mental age* would be five and a half years.

The I.Q. or *Intelligence Quotient* is the mental age divided by the chronological age and expressed as a percentage—in this case 110. Modern intelligence tests may, like Binet's original tests, be verbal or, like Raven's Matrix and others, non-verbal using "picture puzzles" in place of words. Such tests are devised to test "g" or general intelligence irrespective of education and irrespective of "s" or special abilities (such as mathematical or musical ability), which are independent to a large extent of general intelligence. An intelligence quotient of between 90 and 100 is regarded as within normal limits, although one of 75 is quite consistent with efficiency in unskilled work and one of not below 120 is necessary before one can benefit from higher education in a university.

Today the scope of intelligence-testing has been greatly extended so that few people in the more technically advanced countries can go through life without being tested on several occasions. For children it forms a major part of the "eleven plus" examinations which determine at this comparatively early age the form their future education shall take—whether they go to a grammar school or a secondary modern one; for workers in many of the larger industries tests may influence their chance of promotion or even of getting a job at all; and in the Army intelligence tests influence promotion, even more particularly in officer selection.

The Validity of Intelligence Tests.

There can be no doubt that intelligence tests are valuable in predicting the people who are *not* capable of doing certain jobs or following certain careers. What they cannot do is to predict the people who *are*—for example, a man, although highly intelligent, may be emotionally or temperamentally unsuited for industrial management. Nor does anyone now believe that what the tests measure is some absolute intelligence which appears in all that a man does; they simply test those abilities which are useful in industrial society. We know too that, although the non-verbal tests are "fairest" in that they do not discriminate against people whose natural language is not English or who, while intelligent, have not acquired the ability to express themselves well, they are also the least accurate. On the other hand, verbal tests are more accurate but discriminate against working-class children who have had less experience of handling words and concepts than middle-class ones. This is of little importance at both ends of the scale of intelligence (the very dull or the very bright), but it may be extremely important in that middle group where a mark or two either way may make all the difference, and these, after all, are the ones for whom the tests are most needed.

The results of an intelligence test can be considerably influenced by a child's nervousness, indifference, or impulsiveness, and the school records of many great men have been poor, whereas those with good records at school by no means invariably have good records in later life, so even this is by no means an infallible criterion. But once we admit that these are the best methods we have for weeding out the less capable and that it is only just that the most capable should succeed, another problem presents itself, because, as some writers have pointed out, the end result of the process may be a society stratified according to intelligence with what virtually amounts to a class of those who are *known* to be at the lowest level and have been judged to be capable of only menial tasks. Now, in the past the lowest social class has always contained a number of intelligent men who could not only lead the others but could justly claim that they were unfairly held down—but what, these writers ask, will happen when members of this class have to admit that they are *really* inferior in respect of a quality that their society regards as all-important? Instead of becoming more classless, is our society moving towards a new kind of stratification which is even more rigid than the old?

The Managerial Society and the Status-Seekers.

Some sociologists, such as James Burnham in *The Managerial Society* and Peter Drucker in *The New Society* and other books, have pointed out the development in all technically advanced societies (including the Soviet Union) of a managerial class which is the new centre of power. Management, it is argued, is no longer a matter of men who know about the technical processes within their own industry but rather of men who know how to manage as a technique in itself. A man who runs a shoe and boot firm in this view is interchangeable with a man who runs an armament firm, because his skill is in management, not in making arms or shoes. As the man who mediates between the scientist or technician who invents new processes and the workers who have to carry them out, he is the man who gets things done and the core of the new *élite*. Without his aid the scientist and the worker alike are helpless, and industrial society

depends on his ability to produce the goods which make the country prosperous. Yet he is not a capitalist in the old sense but in effect a salaried worker selected (as army officers are now selected) by the most careful scientific techniques, which include not only intelligence tests but also a detailed scrutiny of his past record and a personality test.

Personality Testing.

It is impossible to discuss here the details of personality testing. Suffice it to say that these tests can reveal, without the individual being aware of it, the most intimate details of his personal life—his neurotic tendencies, his adjustment in marriage, his sexual problems. In fact, all those matters which were once thought sacrosanct and the business of nobody but the individual himself. That this is not without its dangers is clear, as has been pointed out by W. F. Whyte in his book *Organisation Man*, where he notes that being able to show that a man is "good" does not necessarily tell us what makes him good or what he is good for, because there is no general agreement as to what qualities make a good manager. Many great industrialists of the past have been far from mentally well-balanced, and the types now selected tend to share the two traits of driving ambition and extreme conventionality, neither of which the unprejudiced would be inclined to regard as particularly desirable in themselves.

Stratification and Society.

Vance Packard's *The Status Seekers* suggests that American society has moved far from the old ideal of "from log cabin to White House," and is on the contrary settling down to a society of fixed levels between which there is very little mobility. There are the two top levels of capitalist and the highest levels of management, a middle group of "fixed-status" men who as junior management or technicians can move down but rarely up, and the large groups of semi-skilled and unskilled workers who are unlikely to progress even so far as the fixed-status group. Having little chance of changing their real status, all groups engage in a frenzied struggle to compete in the outward signs of success measured in terms of the make of one's car, the position of one's home, the names and standing of one's clubs. Packard believes that American society is already more stratified than the older class societies of Europe, and whether or not his analysis is correct, there can be no doubt that in many British firms (since an assessment of "personality" naturally includes social background, education, and social graces) top management is often drawn in "horizontally" from those who have been at the old universities instead of "vertically" from the lower ranks of those who have served the firm for some time in more humble positions.

The Importance of Status.

During the 1930s the Australian industrial psychologist Elton Mayo, investigating the effects of temperature, lighting, noise, and other physical agencies upon working efficiency, found by accident that other factors than those of the physical environment were the most important in determining the worker's attitude to his work. These were his relationship to his working group, the attitude of his management, his knowledge of what he was doing and why he was doing it, and above all his status.

Everyone, in however modest a way, has to feel that what he is doing is of some value and is regarded as such by others; hence many strikes, ostensibly about wages, are really about "differentials" when the higher groups (*e.g.*, engine-drivers) feel that their status has been lowered, not by a real inadequacy of their wage, but by a relative inadequacy when the wages of lower-paid workers have been raised, thus increasing their social status in relation to the higher-paid ones. Psychiatrists, too, have pointed out that many neuroses have as their *immediate* cause conflicts over status which, when it is felt to be absolutely or relatively lowered, leads to a reduction of self-esteem, one of man's most potent drives. This is perhaps the most obvious connection between neurosis and unhappiness in a society which, if it "never had it so good," continues to stimulate ambition in a situation where ambitions are ever less easily attained. As was remarked elsewhere (**F42**) neurosis and delinquency are related in the sense that both are a form of revolt against society, the one open, the other concealed.

The Working Environment.

Modern industry has other important effects upon society which arise: (*a*) from its bigness; (*b*) from the geographical and social mobility which modern methods and concepts of production entail; and (*c*) from rapidly accelerating technical change. Bigness and bureaucracy increase social distance so that communication between various levels becomes a problem and, unless special steps to improve communications are taken, the worker may have little idea of the real nature and end of his work and even less idea of who is responsible for such difficulties as arise during its performance, since it is the nature of bureaucracy to "pass the buck" from one level to another, and thus to reduce individual responsibility. He begins to feel insignificant and a mere pawn in the game. So, too, modern production methods require frequent shifts of man-power from one process to another, and hence the inevitable breaking-up of the small working-groups which once gave the worker a sense of emotional security and significance, and the speed of technical change acts to make a process or a whole industry outdated within a brief period of time (consider, for example, the position of the miners, who ten years ago were being told to produce more coal to save the country from disaster and are now told that there is too much coal and too many miners in areas where the only industry is coal). These, too, increase the ordinary man's sense of puzzlement and his feeling of insecurity in his social status; not unnaturally, they also increase his resentment and nervousness.

The "Angry Young Men" and the "Beats."

Perhaps it is against this background that we must understand our "angry young men" and the young Americans who, in revolt as it would appear against civilisation itself, are described as the "Beat generation." At the lower end of the scale, although associated with the others in the public imagination, are the juvenile delinquents who (we are assured by the more respectable members of society) are increasing in number. Why, respectable citizens ask in despair, should the young show these signs of revolt at a time when we have never been more prosperous and opportunities have never been so good?

This is a very facile way of regarding a serious problem which may well indicate that at least as much is wrong with the attitudes of our self-appointed moralists as with the attitudes of those they condemn, since it is hardly an estimable quality to acquiesce in the values of a society which, it would appear, has somewhere taken a wrong turning. It is the moralists who value social position as a criterion in the upper ranges of society while condemning the fuss made about differentials by an engine-driver, and it is they too who have set up prosperity as a badge of success while complaining that too much money is turning youths into delinquents. Yet the novelist John Steinbeck, in a letter to Adlai Stevenson, suggested that if one wanted to bring a society to its knees one had only to grant it unlimited prosperity, when it would shortly become luxurious, selfish, and "sick, sick" at heart. Perhaps the Angry Young Men and the Beats may some day be regarded as the true moralists who rejected the values of a sick society—at any rate it would be wise to consider the possibility.

The problem, then, is not a simple one, nor has it been adequately explained by the rebels themselves, who, one is apt to feel from their books, are prone to attack without analysing what they are attacking. Indeed, it is likely that they do not fully know themselves, and therefore give the impression of futile rage and, in the case of the American "Beat" intellectuals, an equally futile turning

away from traditional values in art and literature similar to that of the Dadaists after the First World War (G61).

But some things are fairly clear. It is clear that in Britain many of our young writers feel that the working-class boy who has made use of the new facilities in education to go to a red-brick university and obtains as good a degree (or so he thinks) as one from Oxford or Cambridge passes out into a world which is not prepared to assess him on his intellectual abilities alone. Even the working-class man at the old universities soon learns that the student who will get the plum jobs in industry is in fact the member of the old upper-class who has the social graces and the right name as well; he has "the same face at the top of a new suit of clothes" because those who carry out the all-important personality tests will quite rightly hold that these are important facets of personality. So, unless one is a near-genius in atomic physics, the chances of advancement are strictly limited.

The true intellectual and the odd genius are in much the same position because, although people of this type have contributed much to England's greatness in the past, it is increasingly difficult to carry out pure research on one's own, and scientists, like others, have not only to take work in industry in order to earn a living but have to conform to its dictates both as regards social behaviour and the subjects they are permitted to investigate. In many cases this means either getting a very poorly paid job or getting a very well-paid one much below their intellectual capacity, so that expert chemists are working on cosmetics, expert biologists on pet-foods when it is difficult to get public funds for the sort of research that really matters. Since in a complex society it is less easy to assess people at their true worth, people are increasingly judged in terms of their position and salary, and those who fail to fit into this scheme are often regarded as either failures or abnormal—even the psychiatrist has come to see "adjustment" as the ideal of his treatment without asking too earnestly "adjustment to what"?

Disillusionment.

Now the working-class intellectual who has taken the opportunities offered by the new society to improve his position is likely to find two attitudes which are traditionally foreign to his way of thinking: the notion that money is not only desirable but must be sought individualistically and at almost any cost to comfort and peace of mind, since it represents not only security but status, and the notion that literature and art is essentially an upper-class manifestation which, in so far as it treats of the working-class at all does so in a highly romanticised way. The reading or listening public does not want to be bothered with books and plays of working-class life unless they represent it as dramatic or sordid from a basically middle-class point of view. But traditionally the workers have attained what advantages they possess through co-operation rather than competition, and most of them have quite pleasant recollections of a life which was neither dramatic nor particularly sordid. Secretly they despise the type of society within which they, like everyone else, are expected to compete and find that it is not to their liking nor are their works dealing with what they regard as "ordinary" people to the liking of the public who read books or go to the theatre. They, as the most vocal members of their class, are as disillusioned as the scientific workers and raise their voices in protest only to find that their audience wonders with impatience what on earth they are angry about.

Reflection of Social Values.

In America, on the other hand, the pure scientist and the intellectual have always been regarded with suspicion as "egg-heads," and have had either to conform or openly defy society. Previously, they could turn away from society and lead some sort of life of their own on a basis, if not of liking, at any rate of mutual toleration. But now, as everyone is inexorably dragged into the whirlpool of what is graphically described as the "rat-race," it is increasingly difficult even to live without some degree of conformity—as we have seen, even their psycho-analysts will regard those who do not like existing social values as "maladjusted." The response of the "Beat generation" has been to reject social values *in toto*, to write nonsense poetry, to talk a private language, to assert indifference, to ignore conventional morals on the grounds that those who run the rat-race and make hydrogen bombs have no right to criticise anyhow. Such conduct not unnaturally is prone to lead at one extreme to mysticism, at the other to delinquency based either on indifference to social demands or positive revolt, which says in the words of one Beat: "Sure, I knocked out a guy's front teeth, broke a window and a coupla chairs. Sure, I take drugs. But *your* last little piece of delinquency cost twelve million dead and smashed up the half of Europe." To the "Beats" and the "Angry Young Men," as to delinquents, society is not "us" but "you."

Juvenile Delinquency: A Social Problem.

It would appear from statistics that juvenile delinquency is on the increase. Like most statistics, these have to be taken with a grain of salt, but that there has been some increase seems incontestable. Seventy per cent of all crimes are committed by those who are under 21, and the vast majority of these are working-class youths. The real problem is not merely what these figures mean in legal terms but what they mean in scientific and particularly sociological and psychological ones.

"Delinquency," like "insanity" and "crime," is a legal not a scientific concept, because crime is not necessarily synonymous with moral wickedness and a person who to the psychiatrist is suffering from a severe neurosis may be legally "insane." Hence as we increase laws we automatically "increase" delinquency and other forms of crime—*e.g.*, a law forbidding the purchase and carrying of flick-knives (which may be perfectly justifiable socially) will automatically bring to the attention of the courts many youths whose intentions were no different from that of the Boy Scout with his beloved scout-knife. Furthermore, the attitude of the police has changed over the years, so that minor forms of naughtiness, which at one time might have been rewarded by a boxed ear, are more likely to be dealt with otherwise and more officially, and the attitude of the authorities to specific forms of delinquency such as homosexuality or prostitution is undoubtedly influenced by periodic attacks of morality on the part of the public which leads to more arrests quite independently of any real increase.

The term "juvenile delinquency" therefore includes all sorts of cases, ranging from those with serious mental aberrations, through the rebellious and callous, to the merely unduly high-spirited and the puzzled émigré who cannot for the life of him see that marijuana is any more immoral than tobacco or alcohol. What the law disapproves of is not necessarily what society in general disapproves of or what a particular group considers to be wrong, as can be seen from the example of prohibition in America.

Poverty in itself has no direct relevance to delinquency and, in fact, delinquency is less common in the traditional type of society where the poor accept their position and look upon luxuries as "not for the likes of us"; but the situation is entirely changed in a competitive and mobile society where material failure means social death and those who are unable to climb the ladder they have so often been told about are prone to attempt the back door. Nor have television or films any direct influence—people did not become pirates because they had read *Treasure Island*—although, of course, television may supply ideas to those who have already decided on a life of crime. But there is no doubt that both films and television, together with cheap literature and magazines, have a *general* influence, not in making people do specific things, but in giving them a totally false picture of what life is really like and an exaggerated notion of the pleasures of wealth and ease.

IV. RECENT DEVELOPMENTS AND DISCOVERIES

SPACE RESEARCH.

Definition.

By space research we mean scientific research work which can only be carried out by means of equipment carried to otherwise inaccessible observing locations by rocket propulsion. Such propulsion does not rely on the presence of an atmosphere to provide oxygen so that it is capable in principle of conveying objects to unlimited distances. The subject of space research is, therefore, one which is concerned with scientific applications in various fields of a single highly specialised and powerful technique. It is not a single discipline, but can provide data of great importance for many, such as the physics of the earth, the sun, moon, and other bodies of the solar system, astronomy, geodesy, and the study of gravitation. The prospect of investigating the biological conditions on different planets such as Mars and Venus is also opened, as well as that of experimental biological studies under conditions of zero gravity. Although the results of many aspects of space research are vital for those concerned with the practical realisation of manned travel in space, space research is largely a branch of pure science, independent of any applications which may stem from it.

Scientific Applications.

The Earth's Upper Atmosphere.

The greatest altitude attainable by balloons is about 20 miles. Much of great scientific interest remains to be investigated at greater altitudes. The ozone layer, which absorbs ultra-violet radiation which would be lethal to plant life if it reached the ground, is concentrated about the balloon limit but extends upwards to about twice that height. Near the 60-mile limit a number of important atmospheric phenomena occur. Above this level the oxygen becomes predominantly monatomic in contrast to the normal diatomic form at lower altitudes. The ionosphere, a region in which concentrations of free electrically charged particles—electrons and positive ions—occur in sufficient concentration to affect substantially the propagation of radio waves through the region, extends upwards from a height of 60 miles to several hundred miles. It is in fact most concentrated at an altitude of over 200 miles. Meteors are mainly burnt up near the 60-mile level though very small micrometeorites—fine dust less than 10^{-3} mm. diameter—do not heat up sufficiently through atmospheric friction to evaporate, and gradually settle on the surface.

The bright atmospheric glows which are observed in the sky near polar latitudes—the northern aurora borealis and the southern aurora australis—are most frequently observed at altitudes near 60 miles but do extend at times to much higher altitudes. There exists also a much weaker glow—the night air-glow—which does not depend strongly on geographical location. Some of the light in this glow comes from photochemical reactions occurring at altitudes of 40–50 miles, some from much higher altitudes.

The behaviour of the upper atmosphere is strongly influenced by the sun. The electromagnetic radiation emitted continually by the sun is responsible, through its effect on atmospheric atoms and molecules, for the production of the ozone layer, the dissociation of diatomic to produce monatomic oxygen, the ionosphere, and the air-glow. When in a disturbed state the sun also emits streams of electrically charged particles which produce the auroral displays and a number of associated effects. These include disturbances of the compass needle which, when great enough, are known as magnetic storms, and disturbances of the ionosphere, particularly in polar latitudes. The marked concentration of the effect near polar latitudes is due to the influence of the earth's magnetic field on the streams of charged particles which produce the phenomena.

The frequency with which the sun is in a disturbed state and the intensity of the disturbance varies in a roughly periodic fashion over an 11-year cycle.

Although most of these atmospheric phenomena have been investigated for many years prior to the introduction of space research techniques, using ground-base equipment only, there are many important aspects which can only be studied if measuring instruments are sent up to the high altitude concerned. The most important is the measurement of the intensity and wavelength distribution of solar radiation before it enters the atmosphere. Those constituents of the radiation which produce the upper atmospheric phenomena are absorbed in the process and so do not penetrate to ground level. This includes ultra-violet light, X-rays, infra-red rays, and long radio waves, as well as charged particles when the sun is in a disturbed condition.

Many other aspects of the upper air can only be studied through space-research techniques. These include the composition of the charged particles in the ionosphere, the location of the electric currents in the ionosphere which produce the regular variations of the compass needle, as well as those which circulate during magnetic storms, the variation of the intensity of different radiations in the air-glow with height, the composition of the air at heights above 20 miles, and so on. In addition, the pressures, density, temperatures, and wind distribution can be studied more directly, in much greater detail, and up to much greater altitudes than is possible if one is confined to the use of equipment on the ground.

Meteorological Studies.

Instruments outside the atmosphere can make systematic observations on a world-wide basis of the atmospheric circulation, through observation of cloud cover and of the thermal radiation into space from the atmosphere. Such observations are of great importance for meteorology.

Study of Interplanetary Space around the Earth.

Direct observations may be made of the distribution of magnetic field, and of the composition and energy distribution of the neutral and charged matter present in the space outside the earth's atmosphere. This region is by no means empty, and includes a zone or zones of high concentration of particle radiation, extending out to distances of several earth radii. The systematic study of these radiation zones, which are connected with solar variability through the emission of solar corpuscular streams, forms an important branch of space research. In fact, the very existence of these radiation zones was discovered only through space research.

The Figure of the Earth.

The orbit of an artificial satellite vehicle is determined by the gravitational pull of the earth, together with the effect of air resistance. As the latter effect may be separated out, it is possible, from precise observations of the orbit, to obtain information about the earth's gravitation. This in turn depends on the shape of the earth, which may therefore be studied in a new and effective way.

Study of the Physics of the Moon and Planets.

Many important questions can be answered by means of probes sent to the neighbourhood of the moon and planets. These include the measurement of the magnetic fields, if any, of these bodies and, for the planets, the study of their atmospheres, much of which can be done without

actually penetrating to the surface. With instruments landed gently on the surface it is possible to investigate surface conditions and composition by many methods. Information on these questions can be obtained by photography and subsequent transmission of the picture back to earth by some form of television scanning.

Further Applications in Astronomy.

The possibility of observing solar radiation at all wavelengths from outside the atmosphere applies also to the radiation from other celestial objects, such as stars, nebulæ, and interstellar matter. Astronomical observations from the ground are confined to a study of the increase in visible light or in terms of the emission of radio waves with wavelength between 1 cm. and 30 metres. No other radiation can penetrate the atmosphere. With instruments operating outside the atmosphere the choice of radiation in which to observe is, in principle, unlimited, so that X-ray and ultra-violet astronomy becomes practicable.

The Nature of Gravitation.

The nature of the force of gravity is not properly understood. This is partly due to the fact that gravitational forces are very weak unless at least one of the interacting bodies is very large. The scope for experiment in this direction is extended very much if test bodies can be launched to come under the influence of different bodies in the solar system. It is possible also to test certain predictions of the General Theory of Relativity, which is the only theory at present extant which attempts to interpret gravitational forces in terms of more fundamental concepts.

Biological Studies.

One of the key problems in general biology is that of the uniqueness of life. Does anything which can be called life exist in the universe elsewhere than on the earth? It is very unlikely that anything remotely resembling life can have developed on the extremely hostile environment of the moon, but this does not apply with such force to the nearer planets, Venus and Mars. By using space vehicles launched into orbit which pass close to, or land on, these planets it is possible to investigate this important question. The problem is complicated by the need for complete sterilisation of the equipment used so that evidence of life does not stem from terrestrial organisms. It is also most important that the first material to reach the surface from the earth does not spread contamination from micro-organisms so as to make it impossible to study the natural biological conditions on the planet concerned.

In addition to this work, it is likely that use can be made of the environment within a space vehicle to study biological phenomena under conditions of zero gravity. Most other conditions which prevail in space can be simulated sufficiently closely in terrestrial laboratories.

Techniques of Space Research.

The major technical problems involved in space research are:

(a) Launching of the instrument-containing vehicle with the necessary velocity.
(b) Guidance and control of the vehicle so it pursues the desired path.
(c) Tracking the vehicle to determine its actual path and the position on the path at any time.
(d) Transmission of the data, recorded by the instruments, back to the earth.
(e) Satisfactory operation of scientific instruments in the environment within the vehicle.
(f) Provision of adequate power supplies to operate the equipment within the vehicle for sufficiently long periods.

Types of Vehicle.

It is important to distinguish three distinct types of vehicle—the vertical sounding rocket, the artificial earth satellite, and the deep space probe. The track of a vertical sounding rocket is mainly vertical, and the whole path to the highest point and back is traversed in a few minutes only. An earth satellite circulates in an orbit round the earth in the same way as does our natural satellite, the moon. If it approaches the earth at any point within 100 miles of the surface the air resistance causes the path to spiral in so rapidly that the vehicle is burnt up by air friction within the dense atmosphere after the lapse of a few months only. It follows that artificial satellite vehicles are only useful as instrument containers if the distance of closest approach (the perigee distance) is not much less than 100 miles. For the study of the properties of the atmosphere at lower altitudes down to the limit (20 miles) attainable by balloons, vertical sounding rockets must be used. It is a great advantage for work at higher altitudes to use satellites, as it is then possible to make systematic observations for months at a time from a great number of positions relative to the earth.

Deep space probes include vehicles which pass out to great distances from the earth and may leave the neighbourhood of the earth for ever to become artificial planets. Such probes might pass close to the moon or planets or may merely pursue paths well out into interplanetary space.

Launching Velocity.

The provision of sufficient launching velocity involves the use of rocket motors with adequate thrust. To launch a satellite into an orbit circulating within a few hundred miles of the surface a velocity of 18,000 m.p.h. must be imparted. This may be done by using a multi-stage launching system. When the first-stage motor has burned out it drops off, so that, when the second-stage motor ignites, it does not have to support the weight of the first-stage, and so on.

If the launching velocity is increased to 25,000 m.p.h. the vehicle will not return to the neighbourhood of the earth but pass out of the range of the earth's gravitational pull completely. Unless the launching velocity reaches 100,000 m.p.h. it will not escape from the sun and will become an artificial planet.

It is possible in principle to continue to guide a vehicle along a chosen path, after all the launching stages have operated, by utilising radio command signals from the ground to operate controls within the vehicle. In practice, this has been little used up to the present, the guidance and control being built into one of the penultimate stages so that the vehicle is finally launched not only at a speed, but also in a direction, falling within prescribed limits. To launch a near artificial satellite, the direction of projection must be correct within 1° or so.

It is possible in this way to launch a body to make contact with the moon, though the tolerable launching errors are rather smaller—½° in direction, 60 m.p.h. in speed, and a few minutes in time. The problem of guiding vehicles to the near neighbourhood of the planets is much more difficult still, particularly as the distances of the planet from the earth at any particular time are not known to within 10,000 miles or so.

It is not possible to launch a body so that it becomes a satellite of the moon unless braking rockets are included which fire at a suitable point within the moon's sphere of influence (a sphere of radius about 40,000 miles centred on the moon) so as to reduce sufficiently the speed relative to the moon.

Tracking Methods.

Tracking the path of a space vehicle, such as a vertical sounding rocket or near earth satellite, is carried out by optical and by radio means. For

the latter purpose a radio beacon is included within the vehicle so that radio direction-finding may be used. Radio methods are particularly important for acquisition in the case of earth satellites—the initial observation of the vehicle after it has been placed in orbit. Once this has been achieved, optical methods are more accurate.

It is very difficult to follow deep space probes out to great distances by optical observations, as they become extremely faint objects. Attempts have been made to overcome this by causing the vehicle to eject sodium vapour on suitable occasions when sunlit. The vapour stream fluoresces a comparatively bright yellow in the sunlight and assists visual detection. Most reliance must be placed on radio methods, but, even with these, the range of observation is limited by the faintness of the signal compared with background noise. It has, however, been possible to follow the paths of probes passing near the moon out to distances as great as 300,000 miles, by radio direction-finding.

Radio methods are also vital for the transmission of observed data back to earth. This is done by converting the observations into electrical pulses which actuate a suitable radio transmitter so that it radiates a signal, in coded form, which can be received at a ground station and decoded. Problems of the range over which this can be done are at least as severe as for radio-tracking, but on several occasions data has been successfully received from vehicles in the neighbourhood of the moon—240,000 miles from the earth—and this is by no means the limit.

Instruments.

For satisfactory operation of the instruments within a satellite or space probe the internal temperature must be maintained within fairly narrow limits. This may be done by suitable coating of the surface of the vehicle, as the temperature is largely determined from a balance between the adsorption and emission of radiation. Automatic thermostatic controls may be used as an alternative, in which shutters are opened or closed to include or exclude solar radiation. Instruments must be robust enough to withstand launching shocks and vibration and be capable of operation, without maintenance, for long periods.

Conventional batteries may be used as power sources, but for a long lifetime their weight becomes excessive. Solar cells, which convert solar radiant energy into electrical power, are now being introduced, but some form of storage battery is still needed in order that power should be available when the vehicle is not in sunlight. (*See* **F53 (1)**).

Scientific Results Obtained.

The Solar Radiation.

In the visible region the sun radiates as if it were a black body at a temperature of 6,000° K. (Absolute zero on the Kelvin temperature scale is approx. −273·15° C.) It has been found from observations with equipment in vertical sounding rockets that the intensity of solar radiation in the near ultra-violet is less than would be expected for such a body. Thus, at a wavelength of 2,400 Å. (Angstrom = 10^{-8} cm.), the intensity is that which would be indicated by a body of the size of the sun at a temperature of 5,000° K. This tendency becomes more marked as the wavelength decreases until wavelengths of about 1,200 Å. are reached. For smaller wavelengths there is evidence of an increased effective temperature. This becomes very marked for X-rays with wavelengths below 50 Å. The intensity of these rays emitted by the sun very greatly exceeds that which would be emitted if it were a body at the effective temperature of 6,000° K.

Much work still remains to be done before the normal intensity emitted by the sun at all ultra-violet wavelengths has been accurately measured. The study of the variability of the radiations has only just begun. When a violent disturbance or flare occurs on the sun there is an increased emission of short X-rays.

Particle radiation from the sun is discussed below under the heading of "Radiation Belts."

Atmospheric Structure.

The pressure, density, temperature, and wind distribution in the atmosphere up to altitudes of 100 km. or so has been investigated at White Sands, New Mexico, at Fort Churchill, Canada, at Woomera, Australia, and at several locations in the Soviet Union, using vertical sounding rockets.

Pressure and density have been measured using pressure gauges located at suitable places on the shell of the rocket. Soviet investigators have made direct temperature measurements using resistance thermometers, but in other countries the temperature distribution has been obtained indirectly by deriving the speed of sound as a function of height. This is done by a sound-ranging method in which grenades are ejected at regular intervals from a rocket, to explode at a distance of 50 ft. or so from its trajectory. The grenade explosions are located in space by photography and in time by recording the times of arrival of the light from each flash at photoelectric detectors on the ground. Finally, the times of arrival of the sound pulses from each explosion are recorded by an array of microphones. From this information it is possible to derive not only the mean speed of sound through the atmosphere between successive grenade explosions but also the mean east–west and north–south wind speeds.

Results have confirmed the general nature of the variation of temperature with height which had been deduced from ground-based or balloon-assisted studies. Much more detail has been obtained, but it is still not certain whether daily or seasonal effects can be discovered. Many more observations are still required.

Direct measurements at higher altitudes are much fewer in number and limited almost entirely to use of pressure gauges for determination of density. Information at altitudes above 200 km. is available from observation of satellite orbits.

Air resistance causes the period of revolution of a satellite to decrease gradually at a rate which depends on the air density at the perigee (the closest point of approach to the earth's surface). If the dimensions of the satellite are known it is possible to derive the air density from the observed rate of change of period at any time. Results have been derived in this way out to altitudes of 700 km., where the density is about 2×10^{-13} of that at ground. The associated temperature comes out to be as high as 1,000° K. Marked irregular variations of density seem to occur, one component of which seems to be correlated with solar activity. No diurnal and seasonal effects are clearly distinguished. This seems to be in conflict with the highest altitude, vertical-sounding rocket data, which exhibits strong diurnal and seasonal variations.

The Ionosphere.

A great deal of new information about the ionosphere has been obtained by the use of instruments in vertical sounding rockets. The variation of electron concentration with altitude has been studied in detail on many occasions, even under conditions in which no radio transmission over long distances from the ground was possible. Such conditions occur quite frequently in polar regions due to downward extension of the ionosphere.

Information about the way the ionosphere fades off at heights above 200 miles from the earth, which cannot be obtained from ground-based observations, may be derived from precise observations of the radio signals from a transmitter in a satellite which is circulating in an orbit extending to distances greater than 200 miles from the earth.

This is only possible if the frequency of the radio signals from the satellite is not too high. The first Russian satellites used transmitters at suitable frequencies, and a great number of observations have been made of these radio signals, from which data have been obtained about the high ionosphere.

The nature of the free positively-charged particles in the ionosphere have also been studied using mass spectrographs—instruments which determine the masses of the particles—flown in vertical sounding rockets. The rather surprising result has been found that, at altitudes below 100 miles, the main positive particles are ions NO^+ of the molecule nitric oxide, rather than ions (O^+, O_2^+) of oxygen or (N^+, N_2^+) of nitrogen. At much greater height the chief positive ion is that of atomic oxygen, according to observations made with instruments in the third Russian satellite.

Many more investigations are in progress using instruments in vertical sounding rockets and in satellites which are designed to study every aspect of the ionosphere, including the mean energies of the electrons.

The Figure of the Earth.

Much more detailed information than hitherto has become available about the shape of the earth from precise observations of the orbits of the first satellites. This is because the force exerted by the earth on a satellite depends on the figure of the earth. Although it has been known for a long time that the earth is not exactly spherical but is flattened at the poles, satellite studies have shown that the amount of flattening is not exactly that previously assumed. It is usually given in terms of the ratio, $(a - c)/a$, of the difference between equatorial and polar radii to the equatorial radius. The value of this ratio was taken to be 1/297·1, but analysis of the data obtained from satellite orbit observation shows that it should be 1/298·21.

It has been found also that the earth is slightly pear-shaped, with the stalk towards the north pole. The scale of this effect is such that the south pole is 100 ft. nearer the centre of the earth than the north pole.

Much more detailed information will be obtained from further, more accurate, observations of satellite orbits.

The Radiation Belts.

The first two satellites launched by the U.S.A., *Explorers I* and *III*, carried counters to observe the intensity of cosmic radiation. Although this radiation is composed of very energetic positively-charged particles, the counters were also responsive to much less energetic particles. The first results were perplexing. When the satellites were within a few hundred miles of the earth's surface the counters recorded just the intensity expected of the cosmic rays at that height, but no particles were recorded when the satellite receded to distances of 600 miles or more. This behaviour was repeated through many cycles of revolution of the satellites. As nearly all the cosmic rays originate outside the solar system, their intensity could not have fallen to zero at the greater distances of observation. Instead, van Allen suggested that the intensity of radiation is actually so high at these distance that the counters were unable to follow it. He verified by laboratory experiment that this would indeed happen if the intensity exceeded that of the cosmic rays by more than 10,000 times.

This explanation was confirmed by including in the next American satellite, *Explorer IV*, counters which could respond to the high intensity. Meanwhile, equipment for studying particle radiations was included in the third Russian satellite *Sputnik III*. The orbit of the satellite passed over rather higher latitudes than did those of the *Explorers*, and evidence was obtained that at these latitudes the region of intense radiation penetrates close to the earth. It was also established that the particles involved were much less energetic than cosmic rays.

The next big discovery was made with counters in *Pioneer I*, the space probe launched by the U.S.A., which reached a distance of 71,000 miles from the earth before returning to burn up in the atmosphere. Here counters showed that there were two zones of high intensity of particle radiation, one concentrated at a distance of 1,000 miles, the other at a distance of about 15,000 miles. There seems no doubt that a close relation exists between the shapes of the regions and the earth's magnetic field. The inner zone is confined to relatively low latitudes, while the limits of the outer zone follow closely the magnetic lines of force of the earth's field, so that at high latitudes it approaches much nearer the surface. The closest approach is at latitudes where auroral displays are most frequently seen.

Trapping of electrically charged particles by the earth's magnetic field was predicted as long ago as 1913 by Störmer, on the basis of theoretical calculations. Such particles can be released by collision with other particles or by fluctuation of the magnetic field. It is therefore necessary that a source or sources of charged particles be available to make up for loss in this way. It is considered that the outer zone is maintained through replacement by irregular emission of charged particles from the sun. This is consistent with the observations from the counters in *Pioneer IV*, the American space probe which passed the moon to become an artificial planet. This vehicle was launched during a period of solar disturbance, and the intensity in the outer belt was found to be much greater than during the flight of *Pioneer I*, which took place during a quiet phase of the sun. It is also consistent with the observations from Russian equipment in their first lunar probe, which showed that the charged particles in the outer belt are of relatively low energy compared with those of the inner belt.

This belt is considered to be maintained by secondary particles shot outwards from the atmosphere due to impact of cosmic rays on the nuclei of atmospheric atoms.

Artificial radiation belts were created on three occasions during 1958 by exploding rocket-borne atom bombs (of conventional type) at a height of 300 miles in the atmosphere above the South Atlantic. Charged particles produced in the explosions were trapped by the earth's field to form a belt about 60 miles or so thick around the earth between the two natural zones. These artificial belts lasted for five days or so, during which time they were observed by the counters in the satellite *Explorer IV*.

The Moon.

The second Russian lunar probe, which succeeded in hitting the moon, contained a magnetometer to observe any lunar magnetism. This operated to within 50 miles of the surface, but recorded no magnetic field, suggesting that the moon cannot have any appreciable magnetism. Supporting evidence is provided by the failure to observe any zones of intense particle radiation around the moon due to trapping by a lunar magnetic field.

The third Russian lunar probe passed behind the moon and took photographs of that part of the lunar surface which is never visible from the earth. These photographs were automatically processed and then scanned for electrical reproduction. The results of the scan were transmitted by radio signal, on command from the earth, at the next point of closest approach of the vehicle to the earth. From these data the picture was reconstructed on the earth, showing for the first time some of the hidden features of the moon.

Rocket Astronomy.

The first observations of the northern sky in ultra-violet light were made in 1957 with instru-

ments in a rocket launched to a height of 90 miles from the U.S.A. It was found that the regions of greatest intensity of the ultra-violet rays concerned (wavelength 1,300 Å.) did not all coincide with the brightest regions in visible light.

SOURCES OF POWER.

In twenty-five years time four thousand million people will inhabit the earth. How many will there be a century from now, how much power will they need and where will it come from? To people with a speculative turn of mind these questions are interesting, if not disquieting.

There is no way of making energy out of nothing. Energy in a useful form is obtained by converting it from some less useful form. In many parts of the world the chief agents for this are the muscles of men and beasts. In more developed countries these are helped by machines which derive their energy from the burning of fuels like oil and coal. In both cases the useful energy comes from the chemical energy stored in the food or the fuel.

Hydro-electric generators are driven round by the power of falling water. This is the extraction of useful energy through the indirect agency of the sun and the atmosphere, for it is these that provide the rainfall and the rivers. This source of power is therefore virtually inexhaustible.

However, energy has not only to be generated, it has also to be taken where it is needed. This means fleets of oil tankers and millions of miles of electric cables. There must be much unexploited hydro-electric power in, for example, Canada and Siberia, but suitable rivers and valleys are not necessarily near concentrations of population. Similarly, if (it is quite a big if) the sun's heat could be turned directly into electricity, the obvious places to do this would be the hot, cloudless deserts like the Sahara, which are far from the industrial areas where power is needed. Much, however, can be expected from new developments in power transmission. New ways of conveying electricity by high-voltage D.C. systems instead of the usual A.C. are being tried out in Russia and Sweden; and the considerable engineering feat of carrying high-power cables across long stretches of water has been performed in Sweden, Italy, and elsewhere. In due course the electrical power systems of whole continents will be linked together, with a consequent gain in efficiency.

Nevertheless, however perfect the *distribution* system, *generation* comes first. No doubt there are still vast reserves of coal in, for example, China; and the French have this year (1959) tapped the great Saharan oilfield. But, sooner or later, the combustible minerals will be exhausted. Meanwhile power demands will increase. In a modern city, when a district is rebuilt, its electricity demands are trebled. The people of underdeveloped countries, *i.e.*, the majority of the world's population, need vast amounts of power. Furthermore, as the richer deposits of fuel and metals are used up, it will take more and more power to extract chemicals and metals from the poorer ores, *i.e.*, we shall have to spend more power simply to maintain a given standard of living, let alone to advance it.

It is therefore clear that attention must be turned to sources of power that are, for all practical purposes, inexhaustible. Hydro-electric sources are an obvious example, and it has been estimated that when coal and oil are exhausted hydro-electricity will supply about 5% of the world's energy requirements.

The winds and the tides are other possibilities. Projects for using tidal water flows to generate electricity have not generally been regarded as very economic, but they are certainly possible technically, and the French are building such a scheme at present. A scheme for the Severn estuary has been discussed for years. Winds are obviously not very reliable for continuous large-scale power generation, but wind-driven electricity generators can be very valuable for local small-scale work like pumping, battery charging, milling, and so on. There is a 100-kW wind-driven electricity generator operating in North Africa, and the Soviet Union has many thousands of small wind engines at work. However, the main hope for the coal-less and oil-less future lies in nuclear energy, and to that we now turn.

Power from Nuclear Energy.

In this section we try to explain where nuclear energy comes from. It is widely appreciated that an atom is a very small system made up of electrons surrounding an even smaller nucleus (**F10**). The movements of electrons are the key to chemical behaviour. For example, when coal burns, heat (and therefore tractive power or electricity) is obtained because the electron systems in the products of combustion contain less energy than those of the original coal and oxygen; the difference has, at least in part, been made useful. The electrons, and chemical reactions, are not essentially involved in nuclear energy, and we therefore focus attention on the nucleus itself.

Nuclei consist of protons and neutrons joined in various proportions (**F10**). The heaviest naturally occurring nucleus contains 238 particles (92 protons, 146 neutrons) and is uranium 238 (U^{238}); the lightest is hydrogen, which consists of 1 proton. Neutrons and protons attract one another by very strong forces which are not at all well understood; they are called *nuclear forces*. Consequently it requires energy to be supplied if a nucleus is to be pulled apart into its constituent particles. The energy is required to overcome the attractions of the nuclear forces. Conversely, when the particles rush together to form a nucleus, energy is released in the form of heat or radiation. From an energy point of view the situation is analogous to the production of hydro-electric power. For, in that case the gravitational attraction of the earth means that energy must be supplied (by the sun) to lift water (rain) up to a mountain-top. It then rushes down (a river) under gravity, releasing the energy which turns the hydro-electric generator. Here gravitational forces act instead of nuclear forces but the idea is the same.

Binding Energy.

The energy released when protons and neutrons coalesce to form a nucleus is called *Binding Energy*. The binding energy of a nucleus divided by the number of particles involved is called the binding energy per particle, which we will call B. It is very difficult to overestimate the importance of B to the human race. B varies from nucleus to nucleus, and the exact form of its variation is only roughly understood at the present time. But the most significant thing is that B is greatest for elements of medium atomic weight and lowest at the heavy (uranium) and light (hydrogen) ends of the periodic table. This means that if middle-weight nuclei can be formed either from heavy ones or from light ones, B increases and *energy is released in either case.*

Nuclear Fission.

The first of these alternatives is called nuclear fission and the classic case is the fission of U^{235} first demonstrated by Hahn and Strassman in 1939. U^{235} (92 protons, 143 neutrons) is about 0·7% of natural uranium, of which the bulk is U^{238}. Nuclei readily absorb extra neutrons and, if U^{235} does this, it forms U^{236}, which instantly explodes into roughly equal fragments. The fragments are middle-weight nuclei, and there is a consequent energy release, which is detectable in several ways and ultimately convertible to heat. This is the basic source of useful nuclear energy at present.

It would not be so useful but for the circumstance that in the explosion several neutrons are emitted besides the two large fragments. The emitted neutrons can *in principle* enter other U^{235} nuclei and repeat the process, which therefore becomes self-propagating like ordinary chemical

burning. This is called a *chain reaction*. Whether a chain reaction actually occurs or not is a matter of technical design, and this brings up the question of the *nuclear pile or reactor*.

Nuclear Reactors.

Nuclear reactors are pieces of apparatus designed to permit nuclear chain reactions to occur under controlled conditions. (Uncontrolled chain reactions are dangerous, *e.g.*, atomic bombs.) The success of a reactor depends on the neutrons reaching the U^{235} nuclei to produce more fissions and not being wasted in irrelevant processes or simply escaping through the wall of the apparatus (neutrons are quite difficult to contain). The neutrons leaving the scene of fission are rapidly moving, and they stand more chance of causing another fission if they are slowed down. Consequently a material other than the uranium has to be present to facilitate this, and it is called a moderator. A useful moderator is pure graphite. Thus a reactor may consist of alternate blocks of uranium and graphite. If the reactor is too small so many neutrons escape that there are not enough to keep the chain reaction going. The reactor must therefore be greater than a certain *critical size*. In order to intensify or damp down the chain reaction, it is arranged for pieces of neutron-absorbing material, such as cadmium, to be inserted or withdrawn as required.

While the chain reaction is proceeding countless numbers of fissions are occurring, each one liberating energy which turns into heat. The temperature therefore increases, and to prevent a catastrophic rise, cooling has to be provided. The reactor therefore has cooling pipes through which a fluid coolant is pumped. The coolant carries the heat away and, in a reactor designed to produce electrical power, the heat is taken to steam-raising boilers and the high-pressure steam is led to turbines which drive the electric generators.

What we have thus briefly described is the type of reactor first used for serious power production at Calder Hall. This is a graphite-moderated, gas-cooled reactor using as fuel natural uranium (*i.e.*, fissile U^{235} greatly diluted with U^{238}). It produces 46 Megawatts. There is no space to deal with the technical problems, which, over the last two decades in several countries, have been overcome by technological effort which will undoubtedly be remembered for all time. It changed the nature of war and transformed the prospects of material well-being over the whole earth.

Breeding.

U^{235} in natural uranium is the fissile fuel, but the U^{238} is not just inert. It reacts with some of the neutrons in the reactor, ultimately turning into a completely new element, Plutonium (Pu), not found naturally on earth. Pu^{239} will undergo fission and is a possible fuel; it is also of military value. Thus the generation of Pu^{239} from U^{238} in the Calder Hall type of reactor is an important matter, over and above the electricity production. Another fuel is U^{233}, which has similarly to be made artificially from Thorium 232 (Th^{232}). It is possible in a reactor to produce fissionable matter (new fuel) faster than it is being consumed. This process is called *breeding*, and is very important from a long-term power-production point of view because it means that vastly more nuclear fuel is potentially available. In fact, it has been computed that there is enough uranium and thorium in the earth's crust to provide the human race with all the energy it will need for so long as it is likely to survive; and this could be done by mining suitable rocks on a scale similar to our present coal-mining effort. This is a comforting, though necessarily rather imprecise, statement.

Types of Reactor.

The Calder Hall type of reactor is one of many possibilities; theoretically there are over a hundred different kinds. The variety arises because fuel, the coolant, and the moderator have alternatives. Different fuels have already been mentioned. Moderators other than graphite are water, heavy water (*i.e.*, water in which the heavy hydrogen isotope, deuterium, replaces ordinary hydrogen), and beryllium. Gases and various liquids, including liquid metals, can be used as coolants.

It is also possible to make reactors work without slowing the neutrons with a moderator; these are called *fast reactors*. Britain, the U.S.A. and the U.S.S.R. have the fast reactors under observation or construction. The reactor at Dounreay in Scotland began operating on trial in November 1959 after about five years' constructional work. It is a fast-breeder reactor using liquid metal (sodium–potassium alloys) as coolant.

The Americans have had spectacular successes with their nuclear-powered submarines, proving that it is quite practicable to use reactors in propulsion plant. The Russian ice breaker, *Lenin*, has three reactors for motive power. A merchant ship of 22,000 tons is being completed in the U.S.A. and its 20,00-h.p. turbine will be driven by steam from a nuclear heater. This ship, the N.S. *Savannah*, is the first nuclear cargo ship, and it will raise and solve many new problems of marine engineering.

Nuclear-propelled ships, and for that matter, nuclear power-stations, are not necessarily economic propositions. The *Savannah* certainly is not and the British nuclear electricity production, with several stations in operation or under construction, will be hard put to it to compete successfully with conventional methods *so long as coal and oil are plentiful*. It is in the more remote future that nuclear power will become indispensable, and in this context nuclear *fusion* is important.

Nuclear Fusion.

Nuclear fusion is the second of the two alternatives mentioned in the paragraph on binding energy. If light nuclei are hurled at high speeds into intimate contact they sometimes coalesce and release binding energy. This has been studied in laboratories where powerful and energy-consuming machines accelerate small numbers of particles for purely experimental purposes. If useful amounts of energy are to be gained these fusion reactions will have to occur on a bigger scale in an apparatus from which the resulting heat can be extracted in a controlled way. The one "useful" fusion device so far made is the thermonuclear bomb ("H-bomb").

Thermonuclear is the important word. If a suitable gas can be raised to a very high temperature the nuclei are stripped of their electrons and all particles move with very high speeds. The gas is then called a plasma. High enough temperatures will make speeds great enough for fusion reactions to occur and nuclear energy to be released. This is a thermonuclear reaction. For example, in deuterium gas, at temperatures over a million degrees Centigrade, the deuterium nuclei (*i.e.*, heavy hydrogen nuclei consisting of 1 proton joined to 1 neutron) interact to produce helium nuclei. To obtain a net gain in energy from this process, the temperature must be raised to about 300 million degrees C. and maintained long enough; otherwise the energy released is less than that required to heat the fuel and to make up for heat losses.

Many attempts to study the staggering technical problems are being made. In the Harwell machine Zeta the deuterium gas is contained in a metal tube shaped like a tyre 3 metres across. The temperature is raised by passing a huge electric current (about 200,000 amps.) through the gas for a few thousandths of a second. Temperatures up to 5 million degrees were produced, and new apparatus is stepping this up. Neutrons were detected, but the original view that

these were evidence of true thermonuclear reactions did not survive later studies.

Clearly the hot gas must be kept away from the tube wall, otherwise the gas will cool and the walls heat up. The method of doing this is worth noticing.

A current-carrying wire always experiences a force if it is in a magnetic field. This is the well-known electrodynamic force, and electric motors work because of it. If the current is carried in a fluid, *e.g.*, a liquid metal or a plasma, these forces cause bodily movements of the fluid, which are in general very difficult to calculate. The forces are then called *magnetohydro-dynamic forces*. Now magnetic fields are themselves produced by electric currents; so a current flowing in a fluid produces a magnetic field, which then reacts on the fluid itself by means of the magnetohydrodynamic forces. In Zeta this effect acts so as to constrict the electric discharge on to the axis of the tube and thus keeps it away from the walls. This action is assisted by an extra magnetic field produced by a separate current flowing in metallic conductors outside the tube. Thus the hot plasma is contained by magnetohydrodynamic forces and not at all by the material tube wall. In practical devices of the future magnetic forces may have to sustain plasma pressures of 60 atmospheres —a pressure for which a thick steel wall would normally be used!

Zeta is not the only, nor necessarily the most hopeful, approach to thermonuclear fusion. The Russians, French, Swedes, and Americans have experiments in progress, some on quite a large scale. In all the promising cases magnetic fields of one sort or another are relied upon to keep the plasma contained in a small volume of space while it rises to enormous temperatures.

Why is all this effort important? Because if energy could really be extracted from a thermonuclear reaction in deuterium plasma we should have an assured source of energy for all time in the deuterium contained in the sea. 1 gram of deuterium will, in principle, yield about 20,000 kilowatt hours of electricity. The deuterium has, of course, to be extracted by electrolysis, but the cost of this will be a small fraction of the value of the energy gained—once the fusion reactors have been developed. The most optimistic estimates for the development of a useful power producer is ten years; but fifty years has also been suggested.

It is not clear whether nuclear fusion or nuclear fission will ultimately be the best method, but, in either case, the fuel seems assured for ever.

Energy Converters.

Presumably nuclear power-stations will be large concentrated sources of power sending out their power along electrical transmission lines, or they will be for large vehicles like ships. But there are other and smaller energy requirements that are important—for land transport, for portable radios and mobile machinery, for heating and cooking. The petrol- and oil-burning motor will be important as long as coal and oil hold out and, even after that, liquid fuels could be made from timber or from carbon-containing rocks, though the extent to which this would be economic is difficult to predict. Failing this, small vehicles and machines could be driven by electric batteries.

Batteries.

A battery is a device for converting stored chemical energy into electricity, which can then be used for heat, light, traction, or any desired purpose. Primary electrical power, from an oil or nuclear station, must first be available, since batteries have to be fabricated in a power-using factory and the necessary chemicals have to be produced. After that, the battery may need charging periodically like the well-known lead-acid accumulator.

The most well-known battery is the Leclanché dry cell used in torches. It is interesting that today, about a century after it came into common use, it is still the chief source of power in the tactical electronic equipment of the highly mechanised U.S. army. There are, however, many other types of cell, some under active development as space travel and missile warfare call for batteries of lighter weight and utmost reliability.

Fuel Cells.

A recent development is a type of battery into which the active chemicals are fed from external fuel tanks. This is the *fuel cell*, which is being developed in several countries. In August 1959 F. T. Bacon of Cambridge University demonstrated his fuel cell driving a fork-lift truck and a welding machine.

The Bacon fuel cell consists of two electrodes of porous nickel dipping into a solution of caustic potash in water. One electrode is supplied with hydrogen gas from an outside cylinder and the other with oxygen. These gases, forming layers on the nickel, are the active chemicals. The oxygen combines with water to make two negatively charged ions, each consisting of an oxygen and a hydrogen atom joined together (a hydroxyl ion). The hydroxyl ions travel through the solution to the hydrogen electrode, where they combine with hydrogen to form neutral water. Their negative charge (one electron per ion involved) has now arrived at the hydrogen electrode and is ready to flow back to the other electrode through any outside circuit that is provided. This flow constitutes the useful electric current, and it has been provided at the expense of creating water out of the original hydrogen and oxygen. The water can be removed in the form of steam.

What is the advantage of all this? In the first place the fuel gases are easy to make and to store in cylinders. Supplying a new gas cylinder is easier and quicker than recharging an ordinary accumulator. Furthermore, a fuel cell is lighter for a given power than an accumulator; satellite designers may find them useful. The fuel cell is not damaged by heavy overloading, and this is valuable for application to vehicle driving. Fuel-cell-driven buses could combine the advantages of diesel buses and trolleybuses.

Fuel cells are still in the development stage. It is not certain how they will compete with combustion engines or, in the oil-less future, with improved ordinary batteries.

Thermo-electric Devices.

If two wires of different materials are formed into a loop and if the two joins are kept at different temperatures a current flows in the loop. This was discovered by Seebeck in 1822, and the device is called a thermocouple. The electric current could in principle be made to drive some useful machine, and the energy comes from the heat that is absorbed by the thermocouple—if one part of the thermocouple is not hotter than the others it will not work.

It has long been realised that this is a device that converts heat directly into electricity without raising steam and driving dynamos as in a power-station. However, until recently nobody has used thermocouples for much besides temperature measurement, for which they are exceedingly useful. The new development is the manufacture of semiconductors (F17); for the thermoelectric effects of these new materials are much greater than those of metals. A material much studied in this connection is a compound of bismuth and tellurium, bismuth telluride.

It now seems practicable to generate useful electricity from suitably designed thermocouples. For example, the U.S.S.R. produces a thermoelectric device which uses the heat from the chimney of a domestic oil-lamp to produce enough electricity to work a radio. Presumably

this is very useful in remote parts with no electricity supply. But the possibilities do not stop there. Indeed, an eminent Russian authority has stated that thermocouples could produce electricity direct from the warmth of sunlight on a scale and at a cost comparable with conventional fuel-burning power-stations. Even if solar energy cannot be so used, it might be possible to use the heat of nuclear reactors, but this means that the thermoelectric devices would have to stand up to very heavy radioactivity and still work. It is not surprising, however, that many firms are showing great interest in thermoelectricity these days.

Solar Batteries.

Many people are familiar with photo-electric cells—devices which react to light by giving out a small electric current. The variety called *photovoltaic* gives a current whose energy is derived entirely from the light that falls on it. A Swiss firm has used this to make a clock driven by ordinary daylight and nothing else.

A solar battery is a type of photo-electric cell specially designed to give as much electrical power as possible from sunlight falling on it. Once again, we have the possibility of direct sunlight-to-electricity conversion, and again it is semiconductors that have made this possible. The best solar batteries are made of silicon, and they have already proved their worth by providing electricity for apparatus in satellites. Whether large-scale electricity production is feasible this way is still a matter for doubt, discussion, and research.

Thermionic Generators.

A diode radio valve is described on page X8. Essentially what happens is that a hot metal gives off electrons which are collected by another metal electrode, flow through an external circuit and back to the emitter. Provided heat is supplied to the emitter, the current will go on flowing. Here again is a direct method for turning heat into useful electricity. Such devices, considered as electricity generators and not as radio valves, are in their infancy, but theoretically they should be at least as efficient as thermo-electric devices, and would be smaller for a given power. Perhaps they too can use directly the heat from nuclear reactors to give us some at least of the electricity supplies of the future?

Solar Energy.

Many attempts have been made to use sunlight as a power source. Its great advantage is that it is inexhaustible and, at least in suitable climates, it shines every day. The disadvantages are severe; many climates are not suitable, and in any case there is no sun at night; and the intensity is not very great.

Nevertheless, small-scale use is certainly practicable. Mirrors have been used to concentrate sunlight for cookery and for raising steam to drive engines. Solar batteries and thermoelectric circuits have opened new possibilities, certainly for specialised uses and possibly for large-scale power generation.

It has been estimated, however, that if a world population of about seven thousand million were to obtain all its energy from sunlight, then 100,000 square miles of the earth's surface would have to be devoted solely to collecting the necessary rays. Vast installations would have to store the energy overnight, convert it into some transportable form, and deliver it to the centres of population. The capital cost of this would be comparable with the cost of the Second World War, and the scheme is not necessarily impossible. But to quote A. Weinberg, the director of the Oak Ridge National Laboratory, "it does seem extremely unwieldy."

We may therefore conclude that it is just as well for our immediate descendants, and our contemporaries in underdeveloped countries, that there is plenty of oil and coal to get on with, and that there is nuclear power to fall back on in the end. Whatever disabilities the future may bring, an overall lack of power does not seem to be one of them; and who knows what unimagined sources of power remain to be discovered?

CURRENT PROBLEMS IN COLOUR VISION.

A basic problem of colour vision is to find out what enables the retina to make a different response to light of different wavelengths. The light-sensitive elements of the retina fall into two anatomically distinct groups, the rods and the cones. It is usually assumed that colour differentiation depends entirely on the cones. According to the theory proposed by Young and later by Helmholtz in the nineteenth century, which is still the most popular theory, the cones are of three types, each with a different spectral sensitivity. One type is held to be most sensitive in the red region of the spectrum, a second in the green, and a third in the blue. (The graph showing how the sensitivity of a cone varies with wavelength is called a spectral-sensitivity curve.) Except when factors such as contrast enter (see below), the colour seen is presumed to depend on the relative strengths with which three different types of cone are excited by the incident light. On this theory, if the incident light contains a number of different wavelengths (*i.e.*, light from different parts of the spectrum), only a single colour is seen, because the same relative excitations of the three types of cone could be produced by monochromatic light. When appropriate spectral sensitivity curves are postulated for the three types of cone most of the facts concerning colour mixture, variation in the sensitivity to colour (wavelength) change along the spectrum, and similar phenomena can be explained.

Are There Different Types of Cone?

Recently, methods have been developed which provide rather more direct evidence of whether the postulated types of cone exist. In one method, devised by Hartridge, an instrument like a microscope in reverse is used to stimulate an exceedingly small area of the retina. With white light, different colours are seen as the stimulator is moved slowly across the centre of the retina, and this could be due to successive stimulation of different types of cone. But only slight colour changes are seen when the experiment is repeated with monochromatic light. This is difficult to explain if the spectral sensitivities of the different types of cone overlap. Yet unless they overlap, the Young–Helmholtz theory cannot explain the facts of colour mixture, etc. In another method, used by Granit and others, the cornea and lens are removed and a micro-electrode inserted into the neural fibres which emerge from the front of the retina (the rods and cones face inwards towards the brain). The activity in the electrode can then be determined for light of different wavelengths. Occasionally, maximal sensitivity is for a fairly narrow band of frequencies, as though the activity recorded in the electrode originates from a cone with a narrow spectral sensitivity. The position of this band varies, but is usually in one of four regions of the spectrum, corresponding roughly to red, yellow, green, and blue. In a further method, developed by Rushton and also by Weale, light is reflected from the back surface of the retina in order to measure the absorption of the cones of light of different wavelengths. The light passes through the cones twice, and the amount they absorb is revealed by the amount of light emerging from the eye, after allowance has been made for the amount of absorption by the back surface itself. The results so far obtained tend to suggest the existence of two pigments in the cones, one absorbing mainly in the red region and one in the green. The method cannot show whether two different types of cone are associated with the two pigments, or only a single type.

As this brief summary shows, the evidence obtained by these methods does not wholly support nor decisively refute the Young–Helmholtz theory. On one alternative theory, a fourth type of cone is postulated with a maximum sensitivity in the yellow region. Supporting evidence for the existence of this type of cone comes not only from Granit's observations mentioned above but also from other sources. For example, in the two common forms of colour blindness there is an inability to distinguish red and green which is not accompanied by a failure to distinguish yellow from red or green. On the Young–Helmholtz theory, discrimination of yellow should also be lost, since yellow lies in between red and green in the spectrum. However, it should be remembered that there is still no conclusive evidence that more than one type of cone exists, let alone four types. It is usually assumed that any differences between cones in their spectral sensitivity must be due to differences in the pigments they possess. Recently, alternative ideas have been considered. For example, there is the possibility that the internal dimensions of different cones are such that they resonate to light of different frequencies. Although most theorists have postulated different types of cone, Willmer has suggested that all the cones are of one type but that there are two types of rod, each with a role to play in colour vision.

Contrast.

The apparent colour of an object does not depend only on the spectral composition of the light reflected from the object into the eye. For example, a piece of grey paper adjacent to a piece of red paper looks greenish, especially along the border, a phenomenon known as simultaneous contrast. Another example is provided by so-called "hue constancy": the apparent colour of an object in coloured (but not monochromatic) light is usually much closer to its true colour than would be expected from consideration of the spectral composition of the light coming from the object into the eye. Hue constancy seems to depend partly on simultaneous contrast, which is probably due to neural interactions in the retina, but also on complicated adjustments made by the brain. A further example of the complex way in which colour sensations are determined is provided by recent experiments of Land. A scene containing a number of coloured objects is photographed twice, once using a red filter and once using a green filter. Two slides are then prepared from the black-and-white negatives and placed in separate projectors, which are adjusted to cast coincident images. A red filter is then placed in front of the projector with the slide prepared from the "red filter" negative. One might expect this to make the scene look pink, and it does look pink if the image is viewed through a tube so that only a small part is seen at any one moment. But when the image is viewed as a whole the objects are seen in approximately their normal colours. This can be explained as follows. In the composite image the proportion of "red" light at any point will depend on the colour of the corresponding point in the original scene: for example, it will receive relatively more of this light if it was red in the original scene than if it was green. This constitutes a code for indicating colour to the brain provided something in the image can act as a reference point for white. Karp has shown that the highlights on glossy objects fulfil this function and that the Land phenomenon tends to disappear when these are blanked out.

DIGITAL COMPUTING MACHINES.

History.

Digital computing machines are of great antiquity, having first been devised by the Chinese in the form of the abacus or wire frame provided with beads, nowadays used for teaching children. The abacus is, however, by no means dead as a practical computing tool, and is still to be seen in everyday use in banks and commercial enterprises in the East. The first automatic adding machine was invented by Blaise Pascal in 1642, and this in both concept and construction greatly resembled the adding machines of the present day, the chief difference being that modern mass-produced metal gears, shafts, and so on were, in Pascal's machine, suitably carved pieces of wood. The multiplier was invented by Leibnitz in 1671, but this, unlike the adder of Pascal, was not a practical device, not because of any defect in design, but simply because the production techniques of that era were incapable of the repetitive precision which is required to produce a device of this sort. This is shown clearly by the fact that one of the most attractive small modern computing machines, the Curta, is almost identical in principle with that of Leibnitz. The first practical multiplier was produced by Thomas de Colmar in the 1820s, and de Colmar multipliers are still to be seen in one or two of the Assurance offices in the City of London.

Programmed digital calculations were originated by the Englishman Charles Babbage. His first essay in this direction, the so-called "Difference Engine," was based on the idea of J. H. Müller, who, in 1786, suggested that a mechanism could be constructed by means of which a table of logarithms could be built up. Babbage was not content with the Difference Engine, which could perform only the relatively simple operations of addition and subtraction, but went on to design in the 1830s the so-called "Analytical Engine," which in retrospect embodied most of the ideas which find a place in modern automatic computing machines. Babbage, like Leibnitz before him, was prevented from realising his ideas by the crude state of mechanics in his time. He diverted his attention to designing production machinery, for example, the first production gear cutter, and so never constructed the whole of his machine. It is interesting to observe that the input to the Babbage machine was to be on punched cards, based on the idea of Jacquard and later taken up by Herman Hollerith for sorting and other operations of census. The first machine which really embodied the ideas of Babbage on any extensive scale was the Harvard Mark I calculator, completed in 1946 by Howard Aiken. This machine operated by means of electro-mechanical counters and clutches, but was rapidly followed by fully electronic machines, until at the present time it is estimated that there are nearly one thousand of these in operation throughout the world.

The Structure of a Computing Machine.

Probably the easiest way to see what is required to produce an all-purpose computing machine is to consider the way in which human beings perform complex calculations. It is sufficient to observe that, by analysing a large number of extensive calculations, it has been found that out of each minute of computing time only about ten seconds are spent on the actual computing machine. The remaining fifty seconds are spent in consulting tables, deciding what to do next, writing down interim results, and actually depressing the buttons of the machine itself. The implication of this time division is that, by replacing the electrical calculating machine with a faster device using electronic techniques, the maximum saving in time would be only ten seconds out of every sixty. Since electronics, although speeding up operations by factors of up to a million, also increase the cost of the equipment from hundreds of pounds to tens of thousands, it is seen that a system based upon old ideas of man plus machine computing would be hopelessly uneconomical.

To overcome this difficulty mathematicians analysed the different operations which have to be performed. Clearly an electronic equivalent of a desk calculator will be required to perform the operations of addition, subtraction, multiplication, and division. In some early machines more exotic operations, such as square root and cube root, were also built in to the arithmetic unit, as it is called, but nowadays it is rarely, if ever, thought worth while providing these. The next unit which will be required is a replacement for the pencil and paper of the human operator, and also for the mathematical tables and lists of instruc-

tions for the procedure to be followed. The unit which performs these functions is usually called the "store" or "memory." The store in an electronic computing machine can receive numbers and remember them indefinitely, it can emit these numbers later upon request, and stored numbers can be erased and replaced by others. The importance of the last function is that electronic storage media are expensive and cannot, like paper, be thrown away after use.

To replace the human operator a control unit will be required. This interprets the requirements of the arithmetical unit, instructs it as to its course of action, and requests information from the store at appropriate times. In the same way it can cause results obtained by the arithmetical unit to be recorded in appropriate positions in the store. Besides the arithmetic unit, the store, and the control, it is necessary to provide means by which the human problem-setter can communicate with the outside world. These are usually known as terminal organs or simply input and output. The way in which these units are interconnected is shown in Fig. 1.

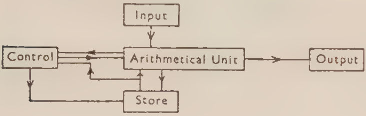


Fig. 1.

Instructing the Machine: Programmes.

It will be noted that there is communication from the store to the control unit. This is because in modern machines the control is not set to perform any specific function, but is arranged so that it can read its instructions from the store itself. These instructions are coded in numerical form, so that, for example, 01 might indicate add, 02 subtract, 03 multiply, 04 divide, 05 write a number in the store, 06 print a number on the output, and so on. The way in which the computing machine decides that a number held in the store is an instruction rather than an arithmetical quantity is quite simple. The human operator always causes the machine to start on a number held in the store which is known to represent an instruction. This number, and each subsequent instruction number, contains data which inform the machine where the next instruction is to be found, as well, of course, as an indication to the machine as to the position of any arithmetical quantities which are to be operated on. For example; the series of numbers 01, 23, 59 might instruct the machine as follows:

the store for the next instruction; if, however, it is negative, then go to position y."

If we regard the store of a machine as a large sheet of notepaper, each line of which is numbered, the way in which a machine follows out a sequence of operations to produce an answer can readily be seen. For example, suppose that we wish to produce a table of the first ten multiples of the number 0·30103. A simple "programme," as it is called, for doing this is as follows, instructions normally being stored in consecutive lines.

Line 1. Clear the accumulator and add line 22 into it.

Line 2. Print contents of accumulator.

Line 3. Add line 22 to accumulator.

Line 4. Print contents of accumulator.

⋮ ⋮

Line 19. Add line 22 to accumulator.

Line 20. Print contents of accumulator.

Line 21. Stop.

Line 22. 0·30103.

It will be seen that this programme generates multiples of 0·30103 by simply adding the number successively into the accumulator. The programme is quite long, requiring twenty-two lines on the electronic notepaper. This is because, although the process is an essentially repetitive one, it has been mechanised by simply writing down the instructions for addition as many times as such an addition is required.

The way in which the branch instruction simplifies the writing of iterative programmes of this sort can be seen by the following example, in which the same set of ten multiples are generated, but this time making use of a branch instruction. The programme is as follows:

Line 1. Clear accumulator and add line 11 into it.

Line 2. Add line 12 to accumulator.

Line 3. Print contents of accumulator.

Line 4. Write contents of accumulator on line 11.

Line 5. Clear accumulator and add line 13 into it.

Line 6. Subtract line 14 from accumulator.

Line 7. Branch. If the contents of the accumulator are positive, proceed in sequence (*i.e.*, to line 8); if not, jump to line 10.

Line 8. Write contents of accumulator in line 13.

Line 9. Return to line 1 for the next instruction.

Line 10. Stop.

Line 11. A temporary store for the multiples, initially it contains zero.

Line 12. 0·30103.

Line 13. Initially 9, decreased by one after each repetition of the process.

Line 14. 1.

It is clear that, as a result of inserting the branch instruction on line 7, the total number of storage positions has been reduced from the twenty-two which were required in the previous programme

$\overbrace{\text{Add to the already accumulated total}}^{01}$ → $\overbrace{\text{the number to be found in position 23 and then}}^{23}$ → $\overbrace{\text{go to position 59 for the next instruction}}^{59}$

Alternatively, instructions can be arranged to follow one another in consecutive locations as in the example given below.

Probably the most important single function in the machine is that of branching, and this has been stated on more than one occasion to enable otherwise inanimate devices to perform operations which are in many ways indistinguishable from the most complicated functions performed by human beings. The nature of the branching process is as follows: most arithmetical units contain a unit known as an "accumulator," which is simply a row of dials, usually in the form of electronic valves, upon which a number can be recorded and into which other numbers can be added and subtracted. The results of any operation on this accumulator is to generate an answer which may be either positive or negative, and the jumping or branching facility of the machine is simply an instruction which says effectively, "If the result of the calculation is positive, go, say, to position x in

to fourteen. This saving becomes even more apparent if the number of multiples required is increased. The former programme simply increases its length proportionately, whereas the latter requires no increase in the number of instructions to be written. To generate the first N multiples it is merely necessary to change the contents of line 13 from 9 to N-1.

Counting on the Binary Scale.

So much, then, for the general operation of the machine. The arithmetical unit, which we have so far ignored, save to say that electronic valves or transistors have replaced the dials of a previous era, has certain features which are of general interest. The first of these is that arithmetic is not performed in the way commonly taught in schools. The decimal scale is convenient for human beings, and has its historical roots in the fact that we have ten fingers and ten toes. An electronic valve, however, is a less subtle device, and can conveniently have only two states, in the first of which it is conducting electricity fully, and in the second of which it is cut off. It turns out that arithmetic can be performed in a scale which uses only two states, on and off, or, to represent them numerically, 1 and 0. Thus, for example, the decimal digits can be encoded in the following way:

Decimal.	Binary.
0	0000
1	0001
2	0010
3	0011
4	0100
5	0101
6	0110
7	0111
8	1000
9	1001

This table can be extended so that any decimal number, however great, can be represented in terms of groups of "binary" digits. The virtue of the binary scale is that arithmetical operations are remarkably simple, for example the addition table is:

$$0 + 0 = 0$$
$$0 + 1 = 1$$
$$1 + 1 = 0 \text{ carry } 1,$$

and the multiplication table:

$$0 \times 0 = 0$$
$$0 \times 1 = 0$$
$$1 \times 1 = 1$$

The simplicity of these is obvious, and some readers will no doubt ask why binary scale is not taught as a replacement for decimal scale in schools. The reason becomes clear if an attempt is made to cast up a set of quantities, each consisting of five or six binary digits. Such a process is quite easy if only two such numbers are added together at a time, as a computing machine does, but if a column of, say, twenty are added in the usual way, starting with the least significant digit and working upwards, the numerous carries which pass from the first column into a number of the higher columns become so great a strain upon the memory of the human being that they cannot be performed accurately. Nevertheless, the adoption of this scale for electronic computing machines has made possible operation at very high speeds.

The second point to be noticed in connection with arithmetical units is that arithmetic can be performed in two different ways. The first, in which all of the digits of the numbers upon which operations are being performed become available at the same time, and the second, in which the digits of interacting numbers appear in sequence, usually starting with the least significant. These two methods of operation, parallel and serial, are the basis for two completely separate systems of machine design. It is easy to see that, because a number of things go on at the same time in a parallel machine, it is intrinsically faster than a serial one. On the other hand, because large numbers of digits must be processed simultaneously, the internal structure is more complicated. It becomes a nice exercise in computing-machine design and logic to decide the most efficient method to use in any given situation, the relevant considerations being such things as cost, desired speed, complexity, and reduction in reliability due to increasing size.

Physical Construction of Computing Machines.

The main electronic components used in the construction of a computing machine are the diode, rectifier, triode, and transistor (*see* **X8–X10**). The latter elements are used to amplify information impulses and also, in pairs, to store information in a circuit known as a "flip-flop." The former two elements are used to decode the numbers which represent machine instructions into unique courses of action, and also to perform the actual arithmetical operations themselves.

Using the latest diode and transistor techniques, it is possible to perform additions at the rate of tens of millions per second.

The chief point of interest in connection with the design of the computing machine is the form taken by the store. Two main storage methods are in common use at the present time, both based

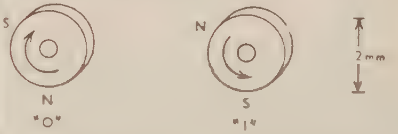

FIG. 2.—Storage on cores of the digits "0" and "1."

upon the fact that certain materials can be permanently magnetised. The first of these devices, the matrix store, is based upon the storage of magnetism in small cores of so-called "ferrite" (*see* **F17**). Ring-shaped cores of the type shown in Fig. 2 can be so arranged that their magnetisation is either in the clockwise or in the anti-clockwise direction, and by means of a suitable interrogation procedure (an electrical test impulse) it is possible to decide what state the internal magnetisation has taken up. Cores are arranged on a

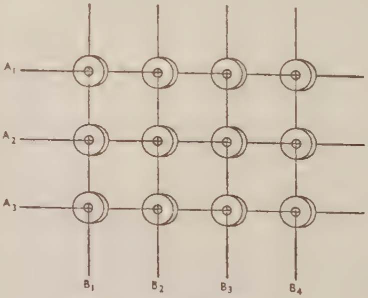

FIG. 3.—Core matrix store.

matrix; *i.e.*, an assembly, of the sort shown in Fig. 3, and information is read out on the lines B1, B2, B3, and so on, by applying a suitable test impulse to an appropriate member of the lines A1, A2, A3. Such core stores tend to be expensive, since one core is used to store each binary digit.

This cost is to some extent compensated for by the fact that core storage is extremely fast, typical speeds being, for example, one-millionth of a second for the insertion or reading out of data from an array of anything up to 30,000 cores. A less expensive but also slower system is the magnetic drum. This consists simply of a cylinder of metal coated with a thin film of magnetic iron oxide. In proximity to this film is an iron core provided with an input–output winding and a gap as shown in Fig. 4. The drum rotates at high speed about its axis. At a given instant a short current pulse is applied to the input winding on the core. This produces a magnetic field in the core which leaks across the gap and thereby magnetises the oxide on the drum. According to the sense of the current at the input point, either a North–South or a South–North magnet can be recorded on the surface. This process is precisely the same as that which is used to record sounds on a magnetic tape-recording machine. The difference, however, lies in the fact that the drum rotates at high speed, so that every fiftieth of a second or so the information recorded at any point on the surface repasses the iron circuit which was used for the recording. As the elementary magnet passes the gap in the iron circuit a change in the flux through the core is produced, and this induces a voltage in the output winding. The sense of this voltage varies according to the direction of the magnet recorded upon the drum circuit, so that here again a North–South magnet can represent the digit 0 and a South–North the digit 1. The volumetric efficiency of magnetic drums is quite high. A typical example is a cylinder 8 in. long and 5 in. in diameter which can store over a quarter of a million binary digits.

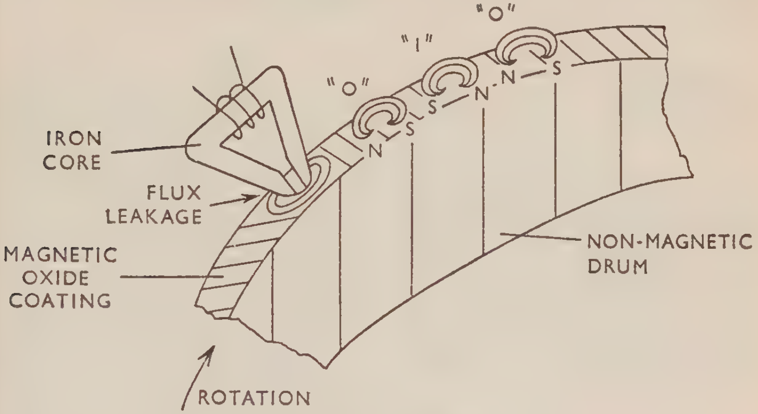

FIG. 4.—Magnetic storage drum.

In the development stage at the present time are far faster and less expensive devices either than the drum or the magnetic core. These are produced by the vacuum deposition of very thin films of magnetic materials upon glass substrates. So-called thin film memories at present in operation in the research laboratories can achieve speeds of a hundred-millionth of a second for the reading or writing of digits in a given place. Transistor circuits of equivalent speed are also being developed, so that it appears that in the very near future computing machines will be available which have arithmetical speeds over 100 million times as fast as those available to human operators of calculating machines.

Applications.

In their earliest form digital computers were suitable only for scientific calculations, and some of their more spectacular applications at this period included the evaluation of π to 3,000 decimal places and the demonstration that $2^{3217}-1$ is a prime number.

After a period of increasing technological application in which the automatic design of power transformers and the evaluation of diesel-electric locomotive performance formed notable examples of machine prowess, the main emphasis passed to business operations of the type exemplified by the calculation of P.A.Y.E. At the present time much effort is devoted to integrated data processing, in which all of the operations of management and accountancy are being carried out within the machine, and human intervention is required only for the higher administrative and policy decisions.

The frontiers of machine application are reached in recent work on the automatic translation of language by machine, and on the simulation of the behaviour of animal brains in recognising shape and pattern.

CHEMISTRY IN THE LIVING CELL.

The cell can be considered as the basic unit of life. Simple forms of life, such as bacteria and protozoa, are unicellular (**F28**, **F23**); with increasing complexity of organic form there is increase in number and specialisation of function of the cells, until in man it has been estimated that there are approximately 10^{14} cells. Ever since cells were first detected by Robert Hooke over 200 years ago with the aid of the optical microscope, the way in which cells grow and reproduce themselves has puzzled scientists. In this century biochemistry has made tremendous progress, and our knowledge of the chemistry of life is very rapidly expanding, due in no small measure to the availability of isotopes (**F10**). With the aid of compounds prepared in the laboratory and labelled with either radioactive or heavy isotopes of elements such as carbon, hydrogen, nitrogen, oxygen, sulphur, and phosphorus, biochemists can now follow the metabolic fate of these substances in living organisms. By these means it has been discovered that life is a dynamic process, that each part of the human body, for example, is continually breaking down and being replaced with new material. It is possible to find out just how each constituent is made and how long it stays in the body before it is replaced, and where and how this takes place. It is also possible to carry out many of the complex chemical reactions of living matter, *in vitro*, by making use of isolated enzyme

preparations. It is becoming increasingly apparent that each individual process of life is a discrete chemical reaction but that life itself consists of many thousands of such reactions, all interdependent and all co-ordinated together within the living cell, which has an average diameter of not more than a hundredth of a millimetre. The complexity of these chemical reactions and their diversity is well illustrated if one considers a single sperm cell, which by chemical reaction alone is capable of giving the necessary information to set in motion all the chain of reactions which will eventually lead to the creation of a replicate form of life.

Pattern of Chemical Organisation.

In the last decade our knowledge of the chemical organisation within the cell has also rapidly and dramatically increased. This has been brought about largely by the intense research into the cause of cancer, which is primarily a disease of abnormal cell growth. Cytochemists have been trying to find out why a cell should change its usual pattern of reproduction and rapidly grow in an uncontrolled abnormal form. The development of the electron microscope has greatly aided them in their understanding of the internal structure of the cell. With this instrument it is possible to obtain sharp images of particles as small as 20 Ångstroms (2×10^{-7} cm.) in diameter, and so, many structures within the cell which were not apparent with the optical microscope are now clearly visible. This, together with recent advances in the techniques of isolating without damage important parts of the cell, has revealed a common pattern of organisation in the majority of cells.

It was originally thought that the cell consisted of three main structures, the cell wall, which surrounded the liquid mass called the protoplasm, which contained a heavier solid structure, the nucleus. It is now known that the protoplasm itself has a very definite structure. When suitable preparations are examined with the electron microscope numerous cylindrical or spherical particles, the mitochondria, together with a finer structure, the endoplasmic reticulum, are detected. On disintegrating the cell, the latter breaks up into a mass of fine particles which are called microsomes. Within the protoplasm there is another non-particulate section called the Golgi apparatus, named after its discoverer. Attempts to isolate these various fractions were for many years unsuccessful; the small mitochondria for example, were very easily damaged, especially by changes in osmotic pressure, and when treated with weak salt solutions much of their biochemical activity was destroyed. These difficulties have now been overcome, and it is possible to isolate nuclei, mitochondria, and microsomes uncontaminated with each other and still in a highly active biochemical state. Rat-liver cells are a very convenient source, although any soft tissue, such as lungs, heart, brain, or muscle could be used. Small pieces of the tissue are ground in a Potter–Elvehjem homogeniser, which is essentially a glass tube with a well-fitting plunger. The liver cells themselves are disrupted, but the smaller particles within the cells, and red blood cells, escape destruction. The homogenate is then centrifuged in sucrose solution. The heaviest particles, the nuclei, are deposited first on the bottom of the centrifuge tube, and the supernatant liquid is then transferred to another tube and centrifuged again at a higher speed, thus bringing down a deposit of mitochondria. On centrifuging this supernatant liquid at a very high speed which exerts a force equal to 100,000 times gravity the microsomes are obtained. These separate fractions after careful washing can then be suspended in suitable reaction media and their biochemical reactions studied separately without interference from other cell constituents.

The Nuclei.

The nuclei are of prime importance to the life of the cell, for if one dissects an amœba, a unicellular organism, so that one half contains the nucleus, this half will continue to live and reproduce normally, but the other half, which is merely a sphere of protoplasm, soon ceases to move and eventually dies. The fact that the protoplasm continues to react biochemically for some time after enucleation can be demonstrated by the way in which it utilises radioactive phosphorus. If, however, a nucleus from another amœba is placed inside this protoplasm, then it will continue to live and reproduce normally. The nucleus therefore controls the normal metabolic processes and is also essential for reproduction.

DNA and Cell Division.

When a cell divides, the chromosomes within the nucleus split into two pairs, one set going to each new cell. These chromosomes must transmit in some chemical form all the information for the new cell to replicate its parent. Chemically the chromosomes consist of deoxy-ribonucleic acid, DNA, which is structurally a long polymer of smaller chemical fragments called nucleotides. Each nucleotide consists of one of the four nitrogenous bases, adenine, guanine, cytosine, or thymine, a sugar, deoxyribose, and phosphoric acid all linked to one another. DNA is the genetic material of the cell, and all the hereditary information that the genes contain is thought to be transmitted by the order in which the four bases are arranged on the long polymeric molecules of this substance. By analysing the X-ray-diffraction patterns of DNA, Watson and Crick at Cambridge have shown that the molecule consists of two long intertwined helices. At cell division it is thought that these two spirals separate, one half going to each cell; there they act either as a mould or a cast, forming a new spiral on their surface which is a replica of the one from which they have just parted. A simple analogy is to consider a toy lead soldier in a mould; if one separates the soldier from the mould and then makes a new soldier in the mould and uses the original soldier to make a new mould, one then has two identical sets of soldiers and moulds.

RNA and the Nucleolus.

The way in which DNA in the nucleus transmits its information to the rest of the cell is thought to be by means of another nucleic acid, ribonucleic acid, RNA, which also consists of chains of nucleotides. In this case the nucleotides consist of one of the four bases, adenine, guanine, cytosine, or uracil, linked with a sugar, ribose, and phosphoric acid. RNA is the chief chemical constituent of the microsomes. When a nucleus is examined under the microscope a portion within the nucleus appears to be different, and this has been called the nucleolus. On studying the nucleolus with the much higher magnification of the electron microscope, numerous small particles are easily discernible, and these are very similar to the microsomes in the protoplasm. Not only are these RNA-containing particles present in the nucleolus but they are also seen to be clustered around the outer membrane of the nucleus. The electron microscope has shown that this membrane contains numerous pores which would thus enable these particles to escape into the surrounding protoplasm and so carry to the rest of the cell the information which has been genetically transmitted.

The Microsomes.

The smallest particles obtainable from a cell homogenate are the microsomes, and the electron microscope has shown that these are really very small fragments of the disintegrated endoplasmic reticulum. They consist chiefly of RNA. By means of very elegant isotope studies, Borsook in the U.S.A. has shown that these particles are in all probability responsible for protein synthesis. Proteins are always associated with life, but in fact they are only complex organic compounds. When pure, some proteins can be obtained in a crystalline state. All the proteins can be split up easily

into their component amino acids: there are about twenty different naturally occurring amino acids. Proteins differ from each other by the sequence in which these simple units are joined together. There are many different kinds of proteins, such as collagen, the structural protein of the skin, and keratin, the protein of hair.

Site of Enzyme Synthesis.

One of the most important classes of proteins are the enzymes. These substances are responsible for bringing about most of the chemical reactions inside the cell; their functions are very varied, each enzyme being highly specific for any particular reaction. Before a cell can grow therefore it has to be able to make enzymes, which are not transmitted as such by the DNA of the dividing nucleus; these enzymes are made by the microsomes. When a synthetic amino acid containing a radio active carbon atom is ingested by a living organism it becomes incorporated fairly rapidly into all the proteins. Borsook decided to study the incorporation of an amino acid as soon as possible after its administration in order to determine the site of protein synthesis. He injected a radioactive amino acid into the tail vein of a rat, and after two minutes removed the liver and isolated the nuclei, mitochondria, and microsomes. He found that the proteins of the microsomes were radioactive, whereas the proteins of the other fractions were not, thus showing that the site of synthesis was probably the microsomal particles. If the microsomes are washed with a detergent-like substance, desoxycholic acid, they are further disintegrated into smaller particles; similar small particles can also be seen adhering to the endoplasmic reticulum when it is carefully studied with the electron microscope. It is these particles which Borsook showed to be the sites of synthesis of protein and, owing to their small size, it is not improbable that each is responsible for the synthesis of one enzyme or one type of protein, which is then discharged into the protoplasm. How, then, do these particles bring about the orderly synthesis of a specific protein? It is thought that the RNA which they contain, acts as a template and that amino acids previously activated or given sufficient energy to combine easily with one another, are orientated in a definite sequence on a molecule of RNA; after all the amino acids have joined together to form the protein molecule this is then released into the cell, leaving the RNA free to repeat the process. Variations in the structure of the RNA molecule would lead to the synthesis of different proteins.

The Mitochondria.

Some mitochondria are visible in a cell when it is examined with an optical microscope, but they become much more readily apparent under the electron microscope. They are usually cylindrical in shape, but this varies with the type of cell, and under certain conditions they are spherical. When seen in a living cell they are in constant motion. They have two outer membranes, the inner one being very convoluted. A rat-liver cell contains about a thousand mitochondria, but in other types of cells the number and distribution of these particles within the cell varies.

The Energy Source of the Cell.

The function of mitochondria is to provide energy for the reactions of the rest of the cell; they are found to be most numerous in those cells requiring most energy and, moreover, are usually grouped within the cell at strategic points for this purpose. Thus in a muscle cell they are grouped around that part of the protein fibre which contracts, and in a sperm cell they are in highest concentration in the neck of the cell where the head joins the vigorously moving tail. How do mitochondria provide this energy? When food, especially carbohydrates, enters the body it is broken down into smaller chemical fragments until some of it is converted to pyruvic acid; this can also be derived from some fats and amino acids. These reactions take place outside the mitochondria, and the pyruvic acid then passes through the semi-permeable mitochondrian membrane to be further metabolised, within the mitochondria, by a series of enzymes. In this sequence of reactions, known as the citric acid cycle, carbon atoms are oxidised one at a time to carbon dioxide, which is then eventually exhaled from the body. In this process energy is liberated not in the form of heat but in the form of an energy-rich compound, adenosine triphosphate, ATP. The mitochondria produce far more energy than they themselves require, and the excess is passed into the cytoplasm as ATP for the use of the rest of the cell. Not all biochemical oxidations are brought about by the direct action of oxygen; the mitochondria contain enzymes for the removal of hydrogen ions and electrons, and these are passed in a series of reactions from one compound to another until they eventually combine with oxygen to form water.

Control of Cell Metabolism.

When mitochrondria are isolated in a pure state from a cell and suspended in solutions of various nutriments they swell and alter shape, this being due to the passage of these compounds through the semi-permeable membrane of the mitochondrial wall. One of the compounds which has a very marked influence on the shape of mitochondria is the hormone, thyroxine. The function of this hormone in the body is to control the rate of metabolism, *i.e.*, the rate at which energy is provided and utilised; it is possible that it achieves this by acting on the mitochondria and so controlling the formation and release of energy. The movement of the mitochondria in the living cell may be an indication of their state of activity. As they alter in shape they expose different parts of their internal structure to the available reactants and also release into the surrounding protoplasm the compounds needed for the metabolism of the rest of the cell. The mitochondria can be broken into fragments by changes in osmotic pressure or by subjecting them to ultrasonic vibrations. It is then found that the different enzyme systems that they contain are associated with certain parts of the mitochondria; some of these enzymes are soluble and escape into solution, while others, especially the hydrogen-transferring enzymes, are associated with the non-soluble fraction. This can be shown, by electron microscopy, to be similar in appearance to the structural membranes of the mitochondria. As more detailed electron-microscope studies of the mitochondria are made it is becoming increasingly apparent that they themselves have a detailed and intricate structure and that the enzymes they contain are arranged in a definite order.

Summary.

From this outline of the functions of the particulate fractions of the cell, it is clear that there is much organisation and division of labour within the living cell. The nucleus, by virtue of its DNA, controls not only the pattern of reproduction but also the general metabolic processes of the cell. It does this by sending out microsomal particles of RNA, which in turn bring about the synthesis of proteins and enzymes. None of this would be possible, however, without the source of energy which is provided by the mitochondria as ATP.

The Golgi apparatus has not been mentioned in detail because nothing is known of its biochemical function. Owing to the ease with which a micro needle will pass through this structure, it is believed to be of a liquid nature, and hence it is not possible to isolate it by differential centrifugation and so study its biochemical functions. It is thought by cytologists to be a collecting area within the cell for the secretion of the substances manufactured within the cell, since this structure is more prominent in those cells which are active secretors. Further studies on the co-ordination of metabolic processes within the cell should lead to a better understanding of the biochemical derangements that occur in malignant cells.

RADIOACTIVITY.

Historical.

Radioactivity is the spontaneous transformation of atomic nuclei, accompanied by the emission of ionising radiations. It was discovered in 1896 by Becquerel, who noticed that salts containing uranium sent off radiations which, like X-rays, can blacken a photographic plate. Two years later Marie and Pierre Curie discovered several new chemical elements which possessed the same property, but many times more intense than uranium, the most important of these was radium. Shortly afterwards it was established, mainly by Rutherford, that three types of radiations called α-, β-, and γ-rays, are emitted from radioactive substances. It was also Rutherford who, jointly with Soddy, deduced that the emission of the radiations is associated with the spontaneous disintegration of atoms which result in the transformation of one radioactive substance into another. A series of such transformations ends when a stable element is produced. All of the heavy radioactive elements can be arranged in three radioactive series, called the uranium, thorium, and actinium series.

Initially, radioactivity was thought to be a property confined only to a few elements occurring in nature. In 1934, however, Irene and Frederick Joliot-Curie discovered that ordinary elements can be transformed into radioactive forms by subjecting them to bombardment with α-particles. Following this, it was found that beams of other fast particles produced in accelerators can also render ordinary substances radioactive.

The discovery of fission in 1939 (**F11** (**1**)) has greatly increased the variety of artificially produced radioactive substances, and the development of nuclear reactors after the War has resulted in very large quantities of radioactive materials becoming available at a reasonable price. Nowadays it is known that radioactivity is a general property of matter; any chemical element can be produced in one or more radioactive forms, or isotopes (**F10** (**2**)). In fact, there are many more radioactive isotopes than stable ones. Whether a given isotope is stable or radioactive is determined by the structure of the nuclei of its atoms.

Nuclear Stability.

The nuclei of all atoms are built up of two elementary particles, protons and neutrons, which have the collective name *nucleons*. The number of protons in the nucleus determines the atomic number of the element (Z), and the total number of nucleons, which is approximately equal to the atomic weight, is the mass number of the isotope (A). Atoms of the same value of Z, but different values of A, are isotopes of the given element.

As we have seen (**F10** (**2**)), protons and neutrons have approximately the same mass, but they differ in electrical properties: the proton carries a unit of positive charge while the neutron has no electrical charge. All nucleons act on each other with specific attractive forces, called nuclear forces, which are much stronger than electrical or gravitational forces. Unlike these, however, nuclear forces are of very short range, which means that each nuclear particle can only attract its immediate neighbours. In a given nucleus, therefore, there exists a mixture of attractive nuclear forces acting between neighbouring nucleons and repulsive electrical forces acting between all the protons.

In certain combinations of protons and neutrons the resultant of all these forces is such as to bind all the nucleons together; such a nucleus is stable. For other combinations the resultant force is disruptive, giving rise to an unstable configuration. For stable nuclei the ratio of the number of neutrons to protons is defined within narrow limits; the total number of stable isotopes is, therefore, limited. Altogether there are 274 stable isotopes among 81 stable elements. In very heavy elements the repulsive forces between the protons are so strong that no stable configuration can exist. Such nuclei tend to break into two, by a process called spontaneous fission.

Radioactive Nuclei.

A nucleus which contains a wrong combination of protons and neutrons is unstable and sooner or later undergoes a transformation, such as to produce a stable form. In most cases this transition to stability occurs through the transformation of a proton into a neutron, or *vice versa*. Protons and neutrons can be considered to be two different states of one fundamental particle; they can interact with each other and exchange identities. If, therefore, we have an unstable nucleus which has too many neutrons, a more stable structure would result if one of its neutrons were to change into a proton. Similarly, in a nucleus which has too many protons, a transformation of a proton into a neutron would lead to a more stable configuration. Since, however, protons and neutrons have different electrical properties, and since an electrical charge cannot be destroyed or created from nothing, the transformation of a neutron into a proton must be accompanied by the production of an electron, while in the transformation of a proton into a neutron a positive electron must be produced. Electrons cannot exist in the nucleus, and they are emitted at the instant of the transformation. We see thus that the result of the adjustment of a nucleus from an unstable into a stable form, is the emission of a fast electron which is called a β-ray; an unstable nucleus can, therefore, be detected by its β-radioactivity.

In the case of heavy elements yet another mode of transformation of unstable nuclei is possible, namely by α-particle emission. α-particles are nuclei of helium atoms; each consists of two protons and two neutrons. Such an assembly is a particularly stable structure and in heavy elements the emission of α-particles turns out to be a more preferable form of disintegration than the exchange of protons into neutrons leading to β-emission.

In addition to the emission of α- or β-particles, some radioactive substances may also emit γ-rays. This happens when not all the energy which becomes available during the transition from an unstable to a stable form is taken up by the emitted particles. The remaining energy is subsequently given off in the form of pure electromagnetic radiation. γ-rays are thus identical with X-rays, but the term γ-rays is employed when dealing with nuclear transitions.

Half-life.

The disintegration of a radioactive nucleus does not take place instantaneously; it is a process governed by chance. In a given substance one nucleus may break up in a very short time, while another may exist for a long time. If, however, the substance contains a very large number of unstable nuclei, simple statistical laws are observed, namely that the probability of a disintegration is proportional to the total number of unstable atoms. The rate of decay then follows an exponential law, *i.e.*, that a half of all the unstable atoms break up in the same period of time. This period of time, during which half of all the radioactive atoms in the substance disintegrate, is called the *half-life*, and is a characteristic property of the given radioactive isotope. Some radioactive isotopes have a half-life of a very small fraction of a second, while for others it is millions of years. Fig. 5 shows a typical curve of radioactive decay for an isotope with a half-life of fifteen hours (sodium-24).

The Curie.

Since the presence of a radioactive substance is detected by means of the radiations emitted, and these signify the breaking up of unstable nuclei, consequently the quantity of a radioactive substance is usually measured in terms of the number of atoms disintegrating per second. The unit of radioactivity is the *curie*, which was originally meant to be the activity of 1 gram of radium; nowadays it is defined as the quantity of a radioactive substance in which $3{\cdot}7 \times 10^{10}$ (37,000 million) disintegrations occur per second. Smaller units, the millicurie (one-thousandth of a curie) and the microcurie (one-millionth of a curie) are frequently employed. Larger units, the kilocurie (1 000 curies) and the megacurie (one million curies) are also used nowadays.

Natural Radioactivity.

Nearly fifty radioactive isotopes occur in nature. Most of these are isotopes of the heaviest elements, from thallium ($Z = 81$) to uranium ($Z = 92$). It is thought that in the process of creation of the universe a very large number of unstable nuclei were produced, but most of them, having short half-lives, have since decayed. Only the few isotopes with half-lives of the same order of magnitude as the age of the earth have survived. Among these are the isotopes of uranium and thorium, which have half-lives of the order 10^9

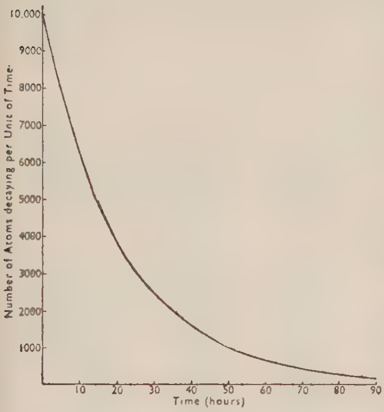

FIG. 5.

and 10^{10} years, and which are the parents of the three series of the natural radioactive elements. There are also a few natural radioactive isotopes among the lighter elements; these, too, have very long half-lives. The lightest of all is the potassium isotope, with mass number 40 (^{40}K) which has a half-life of 10^9 years, and which is a radioactive constituent of the human body. The total activity of radio-potassium in the human body amounts to about 0·1 microcuries. Together with the radiations from the natural radioactive elements in the soil and atmosphere and from the cosmic rays, it produces a natural background of radiation in the presence of which the human species has developed.

Artificial Radioactivity.

Many more radioactive isotopes can be produced artificially from stable nuclei by means of nuclear disintegrations. The structure of a stable nucleus can be altered either by adding to it, or taking away from it, one or more nucleons. In either case this necessitates bombarding the nucleus with some projectile, such as protons, neutrons, deuterons (nuclei of the hydrogen isotope of mass 2), or α-particles. When charged particles are used as projectiles they have to possess a sufficiently high kinetic energy to overcome the repulsive electric forces exerted on them by the positively charged nuclei. This energy is usually measured in units of electron-volts, one electron-volt (eV.) being the kinetic energy acquired by an electron when passing through a difference of potential of one volt. For nuclear disintegrations the energies required are of the order of millions of electron-volts (MeV.). Such projectiles can be produced artificially in special accelerators, notably the cyclotron, in which protons, deuterons, or α-particles can be accelerated to energies of hundreds, and even thousands, million electron-volts. Several hundred radioactive isotopes have been produced by means of such accelerators. Deuterons, in particular, have proved to be very effective in producing disintegrations leading to the formation of radioactive isotopes.

Although in some cases the cyclotron-produced activities are fairly high, a few hundred millicuries, on the whole this method of manufacturing radioisotopes is not economical, mainly because only an extremely small fraction of the bombarding particles hit the target and lead to disintegrations; the majority of the projectiles dissipate their energy in ionising the atoms through which they pass.

Production of Radioisotopes in Nuclear Reactors.

The production of radioisotopes on a large scale became possible only with the advent of nuclear reactors in which radioisotopes are produced by the bombardment with neutrons. A neutron, having no electrical charge, does not experience any repulsive forces when approaching the nucleus, and consequently there is no need to employ high-energy neutrons; in fact, slow neutrons have a higher probability of being captured by nuclei than fast ones when traversing a given thickness of matter. Since neutrons do not exist as free particles, they are bound to be captured by some nuclei in their path, and it is fairly easy to arrange the substance to be bombarded in such a way as to produce the maximum number of radioactive nuclei. On the other hand, since there are no free neutrons in nature, they have to be produced through some nuclear reaction. Initially, the only known way of producing neutrons was through a nuclear disintegration initiated by the bombardment with charged particles; as was shown before, this is a very inefficient process.

The situation changed radically after the discovery of the fission process (**F11** (**1**)), which can be induced by the bombardment of nuclei of the heaviest elements, such as uranium, with neutrons. In this process the heavy nucleus breaks into two nearly equal fragments, and in addition two or three neutrons are emitted as well. These neutrons may in turn cause fission of other nuclei, producing more neutrons and leading to further fission; in this way a chain reaction can be established in which the number of neutrons multiplies in a geometrical progression. If a sufficiently large amount of pure fissile material is assembled, so as to prevent the escape of neutrons or their wasteful absorption in non-fissile material, an enormous number of neutrons can be produced. This is what occurs in the nuclear reactor, for example at Calder Hall (**F51**). Any substance placed in such a reactor undergoes a terrific bombardment with neutrons, leading to the formation of huge quantities of radioactive isotopes.

Apart from the production of radioactive isotopes by neutron bombardment in the reactor, the fission fragments themselves are intensely radioactive. Moreover, each of the fission fragments after breaking up is transformed into another isotope, which is again radioactive; in this way a very large number of radioactive isotopes are produced. Altogether over 200 isotopes, covering thirty-six elements from zinc to thallium, have been identified as fission fragments.

Properties and Applications of Radioactive Isotopes.

By means of the methods described above, it is now possible to produce over 800 radioactive isotopes. There is at least one radioactive isotope to every natural chemical element, and radioisotopes have been produced of elements which do not occur in nature, such as technetium ($Z = 43$) or promethium (61). Several elements have been produced of atomic number greater than that of uranium, which is the last of the naturally occurring elements, namely neptunium (93), plutonium (94), americium (95), curium (96), berkelium (97), californium (98), einsteinium (99), fermium (100), and mendelevium (101). The production of elements number 102 and 103 has also been reported.

Each of the elements which exist in nature can thus be produced in a form which is chemically and biologically identical with the stable element, yet has the property of being radioactive, *i.e.*, of emitting radiations which can be detected in a simple manner and with an extraordinarily high sensitivity. These properties of radioactive iso-

topes make them eminently suitable for the study of chemical and biological processes. They are of particular importance in the study of metabolic processes, since this can be achieved by the addition of an extremely small amount of radioactive substance which does not, in any way, upset the processes to be studied. They have also opened the way to investigation of the dynamics of metabolic processes and are already widely used as an aid in the diagnosis of disease. Besides medicine, there are also numerous applications of radioactive isotopes in agriculture, technology, and industry.

To be appropriate for such applications the radioactive isotope must have suitable properties, such as a convenient half-life and the emission of radiations of the right type and energy. Table I gives a list of some of the most frequently used radioactive isotopes.

TABLE 1.

Isotopes Most Frequently Used.

Radioisotope.	Symbol.	Half-life.	Radiations emitted.	Maximum energy of β-rays, MeV.	Main γ-ray energies MeV.
Tritium	^{3}T	12·26 years	β	0·018	—
Carbon-14 . . .	^{14}C	5,568 ,,	β	0·155	—
Sodium-24 . . .	^{24}Na	15·0 hours	β, γ	1·39	1·37, 2·76
Phosphorus-32 . .	^{32}P	14·3 days	β	1·71	—
Sulphur-35 . . .	^{35}S	87·1 ,,	β	0·167	—
Calcium-45 . . .	^{45}Ca	164 ,,	β	0·25	—
Iron-59	^{59}Fe	45·1 ,,	β, γ	0·46	1·1, 1·3
Cobalt-60 . . .	^{60}Co	5·25 years	β, γ	0·31	1·17, 1·33
Bromine-82 . . .	^{82}Br	35·9 hours	β, γ	0·44	0·55, 0·77
Strontium-90 . .	^{90}Sr	28 years	β	0·61	—
Iodine-131 . . .	^{131}I	8·04 days	β, γ	0·61	0·36
Caesium-137 . .	^{137}Cs	30·0 years	β, γ	0·52	0·66
Cerium-144 . . .	^{144}Ce	285 days	β, γ	0·31	0·13
Thulium-170 . .	^{170}Tm	127 ,,	β, γ	0·97	0·08
Gold-198	^{198}Au	2·69 ,,	β, γ	0·46	0·41
Radium	^{226}Ra	1,622 years	α, γ	4·777	0·19

a neutrino. The latter is postulated to have no electrical charge and practically no mass. Its main function is to share with the electron in the energy released during the β-disintegration. It also serves to preserve the balance of angular momentum. Although the properties of the neutrino make its detection extremely difficult, its existence has been proved recently in a very ingenious and elaborate experiment.

The disintegration energy in β-transformation is also of the order of a few MeV., but due to the small mass of the electron its velocity is almost that of light; the rate of ionisation is consequently about a hundred times less than for an α-particle of the same energy. The range of the β-particle is correspondingly longer, and is of the order of a few metres in air, or a few millimetres in solids. Again, in contrast to α-particles, the scattering of β-rays is a very frequent event, so that the path of a β-particle is very tortuous. Combined with the continuous spectrum of energy, this results in the attenuation of a beam of β-rays in passing through matter being nearly exponential, despite the fact that like α-particles, β-rays lose energy mainly through ionisation.

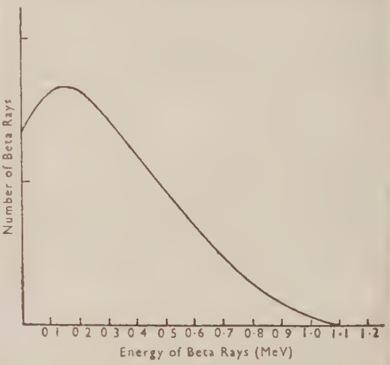

FIG. 6.

Alpha-particles.

Radioactive decay by the emission of α-particles is observed only in heavy elements. All α-particles emitted from a given radioactive substance have the same energy (sometimes several monoenergetic groups of α-particles are emitted, corresponding to different excitation states of the nuclei). Among the natural radioactive elements the energy of the α-particles varies from 4 to 9 MeV. Being a heavy particle (the nucleus of the helium atom) and carrying two electrical charges the α-particle has a very high probability of ionisation, that is of knocking out electrons from atoms encountered; on an average, about 4,000 ions are produced by an α-particle per millimetre of path. The α-particle thus dissipates its energy very rapidly, and its range in air at atmospheric pressure is from 2·5 to 8·5 cm.; in solids the range is of the order of 10–100 microns. Due to its large mass, relative to that of the electron, the α-particle is deflected from its path only in the rare event of a collision with a nucleus. The path of the particle is therefore a straight line until the end of its range.

Beta-rays (or particles).

This term includes both positive and negative electrons. The emission of β-rays is the most common mode of decay of artificial radioactive isotopes (**F10** (**2**)).

Unlike α-particles, β-particles from any radioactive isotope are emitted with a continuous distribution of energies, from zero up to a well-defined upper limit. Fig. 6 shows a typical energy spectrum of β-rays. The upper limit value corresponds to the energy released during the disintegration. The fact that energy is apparently lost in β-decay, without any way of accounting for it, presented a serious theoretical difficulty which was only removed by Pauli's hypothesis of the neutrino (**F12** (**1**)). According to this, at each β-decay two particles are emitted, an electron and a neutrino.

Gamma-rays.

These are electromagnetic waves and are produced if the radioactive transformation leaves the new nucleus in an excited state (**F11** (**2**)). At the transition of this nucleus to the ground state the

surplus energy is given off as a γ-ray. The energy of γ-rays varies from a few thousand to a few million electron-volts.

γ-rays do not ionise directly. They interact with matter by three different processes, all of which result in the formation of fast electrons, which in turn produce ions. The probability of any of these processes occurring is proportional to the intensity of the γ-rays, so that the absorption of γ-rays of a given energy in matter is exponential. The half-value-layer, *i.e.*, the thickness which reduces the intensity of a γ-ray beam to one-half, depends on the energy of the rays and on the atomic number of the absorbing substances; for γ-rays of about 1 MeV. passing through lead it is about 1 cm.

BIOLOGICAL EFFECTS OF RADIATIONS.

As was seen, α-, β-, and γ-rays in passing through matter cause ionisation, the ejection of electrons from atoms. They may also cause excitation of atoms and dissociation of molecules. These processes usually result in chemical changes in the substance along the path of the radiations; in the case of living matter it may result in damage to a cell, sometimes leading to its death. The mechanism of action of radiations on living matter is not yet understood, and in many instances there are not enough data even to establish an empirical relation between the effect produced by radiation and the dose of the radiation.

If the gonads (the reproductive organs) are exposed to radiations, mutations of genes may result (F31 (1)); in most cases such mutations are deleterious. Such action does not produce any harm to the individual exposed, but the bad gene may be transmitted to the next generation and will eventually result in the birth of an individual with a genetic defect. It is believed that the probability of mutation is a linear function of the dose of radiation, so that any increase in dose causes a proportionate increase in the number of mutations. A certain number of mutations always occurs, from the natural background of radiations and mainly from other causes. The doubling dose, that is the dose of radiation required to double the natural mutation rate, is about 30 rad. (The rad is the unit of absorbed dose and corresponds to an absorption of energy of 100 ergs per gram.) The dose rate of the natural background of radiation is about 0·1 rad per year.

If other cells in an organism are exposed, some harm may result to the individual exposed. With a sufficiently large dose symptoms of radiation sickness may occur within a few days after the irradiation. These symptoms include skin burns, loss of hair, temporary sterility, and, if the dose is very large, death within a few weeks. Although there are very few data concerning man, it is believed that a dose of about 300 rads given in a short time to the whole body will result in the death of 50% of persons exposed.

If the irradiation is spread over a long time, or if only part of the body is exposed, no death will occur and, indeed, no other symptoms may be apparent for some time after irradiation. But some effects may appear much later, sometimes after many years. These late effects include cataract, leukæmia, and cancer. It is not yet known whether the probability of these effects is a linear function of dose, or whether there is a threshold dose below which these effects do not occur.

Radiological Protection.

In the absence of definite data about the effects of small doses of radiation, it is prudent to assume that any excess of radiation may be harmful and should be avoided. For people who occupationally deal with radiations, and who cannot avoid receiving some exposure, there have been established certain maximum doses, which, in the light of present knowledge, are very unlikely to produce deleterious effects. The maximum permissible dose for any individual is at present 50 rads during the first thirty years of life and an additional 150 rads during the rest of the life; this corresponds to an average of about 0·1 rad per week. For the whole population the maximum permissible dose is 10–100 times less.

The increase in generation of electrical power from nuclear reactors based on fission, and the growing use of radioactive isotopes made it necessary to establish certain maximum concentrations of radioactivity in water and in air, so that the population will not receive a dose higher than the maximum permissible. These concentrations vary from substance to substance, depending on their radioactive as well as their biological properties, such as the time of their retention in the body. For example, for radium the maximum permissible concentration in water is 4×10^{-8} microcuries per litre, and in air 8×10^{-13} microcuries per c.c.; for radioactive cæsium it is 2×10^{-3} microcuries per litre in water and 2×10^{-7} microcuries per c.c. in air. Special monitoring instruments are available to check the concentrations of radioactivity in water and in air. For workers in the radiation industries, special monitoring devices, such as film badges, are available to record the doses received by them. With these, and other precautions, it should be possible to utilise in full the advantages of atomic energy and radioactivity without causing harm to the population.

ČERENKOV RADIATION.

In 1958, the Russian physicists Čerenkov, Frank, and Tamm, were awarded the Nobel prize for their investigation of a phenomenon which has come to be known as Čerenkov radiation. The following is a brief account of the effects and its applications in research.

Discovery.

One of the properties of radioactive substances, which has been known since their discovery, is that their radiations can cause certain materials to fluoresce. This property was indeed used in much of the early work on radioactivity as a means of detecting the emitted radiations. The amount of light produced depends greatly on the material used and is largest for certain impure inorganic salts, such as those used in fluorescent discharge lamps and television tubes. On the other hand, the light given off when pure inorganic crystals and liquids are bombarded by radioactive particles is very much less, and was at one time thought to be due solely to residual impurities. In 1928 it was shown by L. Mallet that the light emitted by liquids had a different spectrum from that which would have been expected if it were due to impurities, but it was not until the careful and detailed investigations at Moscow of P. A. Čerenkov, 1934–36, that the existence of a new effect was clearly established. The light emitted when fast-charged particles traverse pure transparent materials is now called the Čerenkov radiation.

Properties.

The simple but ingenious experiments of Čerenkov established the main features of this new effect. The light emitted, when examined spectroscopically, has a continuous spectrum which extends into the ultra-violet and is quite different from the line or band spectrum of ordinary fluorescence. There is no emission of light by this process unless the atomic particle has a velocity greater than that of light in the transparent material. (By the Special Theory of Relativity (F14 (1)) no particle can travel faster than the velocity of light *in vacuo*, but light travels more slowly in media other than a vacuum by a factor equal to the refractive index.) The emitted light is not radiated in all directions but at a certain angle, which depends on the particle velocity, with the track of the particle. The light is also polarised in a characteristic way. Its intensity is always very weak, even for the fastest particles, and is less than 1% of that produced by the same particle in a good fluorescent material.

Explanation

I. Frank and I. Tamm, two theoretical physicists working in the same institute as Čerenkov, explained the phenomenon shortly after its dis-

covery. They reasoned that if a particle moves faster than light in the medium, then some of its energy could be radiated in a manner analogous to that in which a fast boat can produce a bow wave or a fast aeroplane the shock wave which is heard as a "supersonic bang" (F70 (1)). They were able to develop this idea mathematically, making use of Maxwell's theory of light as an electromagnetic wave motion (F12 (1)), and thus to account quantitatively for all the properties of the new radiation which Čerenkov had reported. As given by Frank and Tamm, the theory was a classical one in the sense that no account was taken of the atomic nature of the transparent material. Subsequent quantum theories of the effect have shown that allowing for this latter fact only leads to slight modifications in the theoretical predictions.

Applications.

For something like fifteen years after its discovery there were no applications made of the Čerenkov effect. It is only in the last few years, when extremely sensitive photo-electric cells have become available, that it has become possible to detect the passage of a single particle by recording its Čerenkov radiation. This method of detecting particles is an alternative one to the more common Geiger and scintillation counters. The advantage of the Čerenkov detector is that it is the only method which can give direct information on the velocity of a particle; a detector of this sort was used in the first experiment in California which demonstrated clearly the existence of the anti-proton (F12 (1)).

It has proved possible to detect the Čerenkov light emitted by cosmic-ray particles as they traverse the earth's atmosphere. The light emitted by a single particle is too small to be detected, but when large numbers of secondary cosmic rays are generated simultaneously—the phenomenon of cosmic-ray "showers"—the amount of light is proportionately greater. So far it has only been possible to make consistent observations on clear, moonless nights, so that the technique is of only limited value in studying cosmic rays.

One interesting feature of the radiation is that it is distributed uniformly over all wavelengths for which the medium is transparent and has a sufficiently large refractive index. It has been suggested accordingly that a beam of fast electrons could be used to provide a source of radiation in regions of the electromagnetic spectrum where other sources are not available. At the present time work is in progress on the generation by this method of appreciable amounts of power in the spectral region of long infra-red or very short radio waves, but it is too early to say whether the method will be of practical value.

NON-CONSERVATION OF PARITY.

A very surprising addition to our knowledge of the elementary particle interactions was made, following the suggestion of the Chinese-born American physicists Lee and Yang during the summer of 1956, that parity might not be conserved in decay processes such as β-decay (F10 (2)) or meson-decay processes (F12 (1)). This hypothesis was confirmed early in 1957 by the experiments of Wu and others on the β-decay of cobalt (Co^{60}), and almost at the same time by Lederman and others for the decay of π- and μ-mesons (F13). It is probably not an exaggeration to suggest that the discovery of parity non-conservation represents the most exciting revision in our fundamental thinking about space and time since the introduction of Einstein's Special Relativity Theory in 1905.

Invariance of the Laws of Physics.

In order to understand what is meant by parity non-conservation, indeed, it is helpful to recall the main idea of Einstein's Special Theory—that all reference frames in uniform motion relative to each other are equivalent in their description of the laws of physics. Mathematically we say that the laws of physics are invariant to Lorentz transformations. Physically we may say that it is impossible to single out any one frame and say that it is at rest in fixed space—all the frames are on an identical footing. This idea, introduced by Einstein, of finding invariance principles for the laws of physics has been a tremendously fruitful one, and in combination with the quantum theory has been the means of building up our present theoretical picture of elementary particle physics. Typical of such invariance principles, for example, is the idea that the laws of nature should be exactly the same for matter and for anti-matter, *i.e.*, that they should be invariant to the process of the replacement of every particle by its anti-particle (sometimes called charge conjugation and denoted by the symbol C). Corresponding to our world, which we shall define to be composed of matter, we can imagine an anti-world to be constructed by replacing every particle in the world by its anti-particle—proton by anti-proton, neutron by anti-neutron, electron by positron. According to the idea of the invariance of the laws of nature to charge conjugation, this new anti-world is a perfectly possible one, in which all phenomena could occur exactly as in our own. Were we in touch with some distant world by radio, it would be quite impossible to tell merely by interchange of observations whether it was made of matter or anti-matter, for each would report the same result for every measurement.

Parity Transformation.

We now turn to the idea of parity transformations. It was a natural extension from the idea of the invariance of the equations of physics to proper Lorentz transformations, *i.e.*, to transformations to uniformly moving or rotated frames of reference, to add the hypothesis that the equations of physics are invariant also to reflections in space and time. The parity transformation is in fact reflection at a point in space. We are more familiar with the idea of reflection at a plane surface—a mirror. The parity transformation can be regarded as being made up of reflection in a mirror, followed by a rotation through 180° about a normal to the mirror. Thus if we look at ourselves in a mirror we see an image the right way up, but with right and left hands interchanged. Completing the parity transformation means that the image is also turned upside down. Since we already know that the equations of physics are invariant to rotations of the reference frame, we see that invariance to the parity transformation is the same thing as invariance to reflection in a mirror. The most vivid way of expressing this invariance is to treat the transformation as an "active" one. Suppose that we have any physical system in the room with us. We place it in front of a mirror and then study its mirror image. Parity conservation means that this mirror image obeys exactly the same laws of physics as have been established to hold in our room. Looking only at the mirror image, we have no means of telling that it is in fact a mirror image and not "the real thing."

Failure of the Law of Parity in Beta Decay.

Now we know that, at a fundamental level, all atomic processes are controlled by three sorts of interaction: nuclear interactions which bind neutrons and protons in atomic nuclei; electromagnetic interactions, responsible for atomic and molecular structure, and hence for all the chemistry of everyday life; and the weak decay interactions such as β-decay. There is every reason to believe that parity is conserved both in nuclear and in electromagnetic interactions. It was perhaps inevitable that one should assume that Nature always exhibits such a symmetry. However, physics is an empirical science, and feelings of elegance or symmetry must give way to the facts of experiment, which have now conclusively established that parity is not conserved in β-decay—the mirror image of an experiment in β-decay is not one that can occur in accordance with the laws of nature.

Chirality in Nature.

It is clear that parity non-conservation must be related to some "chirality" or "handedness" in Nature. An object is called "chiral" or "handed" if its mirror image cannot be made to

coincide with the original object by translations or rotations in space. As implied by the name, the simplest "chiral" object is our hand. The mirror image of a right hand is a left hand, and to make our left hand coincide with our right we should need to be able to interchange its back and front. To take a homely illustration, a pair of gloves are chiral, but a baby's mittens are identical with their mirror image. Consideration of this example shows what we need to have for an object to be chiral—there must be a plane in the object in which is specified a direction of rotation and there must be a normal direction to the plane (corresponding to the back and front of a glove). In this way the fundamental chiral object can be represented by a screw.

In Nature we certainly find chiral objects—for example, in the inorganic world there are right- and left-handed crystals. These crystals will often form in roughly equal numbers right or left handed, so that in general for the inorganic world the mirror image is not only in principle possible, but actually occurs. In the biological world things are rather different. We are all familiar with "handedness" on the morphological scale. Equally on the biochemical scale enzymes and nucleic acids, like the famous DNA (F58 (2)), may exist only in a single right- or left-handed form. It is interesting to speculate how these right- and left-handed properties of biological systems have arisen, no doubt through the operation of natural selection. However, we need have no feeling that the absence of opposite-handed biological forms has anything to do with non-conservation of parity. The opposite-handed forms could certainly exist in principle in accord with the laws of chemistry, but do not happen to do so.

The Parity Experiments.

We turn now to the consideration of β-decay, of which the typical process is the decay of the neutron into a proton, an electron, and an anti-neutrino (it is purely conventional that we prefer to call the neutral particle an anti-neutrino). The β-decay investigated by Wu and others was that of the isotope of cobalt of mass number 60, Co^{60}, which decays like a neutron to an isotope of nickel, Ni^{60}. Co^{60} has a spin of 5 in the fundamental unit of angular momentum (Planck's constant divided by 2π). Associated with this spin is a magnetic moment, so that at sufficiently low temperatures, and in a strong magnetic field, the nuclear spins in a specimen of Co^{60} can be aligned in a given direction. We shall suppose that the spins are oriented upwards, meaning that the angular momentum of each Co^{60} nucleus has the same sign as that of a top spinning in a right-handed screw with respect to the upward direction as axis. The decay electrons were looked for from Co^{60} aligned in this way, and they were found to be emitted preferentially in the downward direction, *i.e.*, opposite to the spin direction of the Co^{60} nuclei. Suppose now we look at this experiment in a vertical mirror. The electrons in the mirror still seem to come preferentially downward, but the mirror image of the Co^{60} nucleus with right-handed spin about the upward direction is a Co^{60} nucleus with a left-handed spin about the upward direction, or in other words a right-handed spin about the downward direction. Thus the mirror image of a Co^{60} nucleus with spin oriented upwards is a Co^{60} nucleus with spin oriented downwards. The experiment in the mirror thus shows a Co^{60} nucleus emitting electrons preferentially along the direction of its spin. Now we have already noted that Co^{60} in fact emits electrons preferentially opposite to the direction of its spin, so we assert that the mirror-image experiment is one that cannot occur according to the laws of Nature, or in other words that parity is not conserved in β-decay. Looking at the β-decay of Co^{60}, we are able to distinguish between the real and the looking-glass world. It might be objected here that the behaviour of Co^{60} is no different from that of one of the biological systems mentioned earlier, which, in our environment, occur in only one form of handedness. However, this would imply that, say, the neutron was a complex particle with some hidden structure to account for the direction of the electron emission, and such a picture is quite at variance with our ideas of the neutron as an elementary particle.

Interpretation of Bias in Nature.

For an explanation of the handedness occurring in β-decay it is obvious to look at the neutrino (or anti-neutrino) which is characteristic of the process. The neutrino is a spinning particle (actually spin equal to $\frac{1}{2}$ in fundamental units). Handedness will, for example, be introduced if the neutrino spin is invariably aligned, either left handed or right handed with respect to its direction of motion. Related experiments have in fact confirmed that the neutrino always appears as a particle with left-handed spin (anti-neutrino right-handed).

All present evidence on decay processes accords with the above interpretation. We may note some consequences of it. If the neutrino is always to have a spin like a left-handed screw with respect to its direction of motion, then it must move with the velocity of light, and correspondingly have zero rest mass—otherwise it would be possible to make a Lorentz transformation to its rest frame. Again we may consider the mirror image of a neutrino moving parallel to the surface of a mirror. The neutrino spin in relation to its direction of motion forms a left-handed screw. The mirror image is a right-handed screw, *i.e.*, a neutrino with right-handed spin, which does not exist. Equally the charge conjugate of a neutrino would be an anti-neutrino with left-handed spin (since charge conjugation leaves the spin unaltered). Again there is no such particle. However, if we imagine that we simultaneously take the mirror image and the charge conjugate of a neutrino, this produces an anti-neutrino with right-handed spin, which is a valid physical system. Thus though β-decay violates both parity conservation and charge conjugation separately, it may be invariant to the product of these, CP, and indeed appears to satisfy this condition. In plain language, then, the mirror image of a β-decay experiment with ordinary matter is identical with the β-decay experiment for the corresponding anti-matter. Our ability to distinguish between the real and looking-glass world must then be limited by our ability to distinguish between real and ordinary matter. For example, we may solve the old conundrum of conveying to an observer in a distant planet what we mean by a right-handed screw by telling him that it is typified by his anti-neutrinos, only if we are sure that his planet is of matter (not anti-matter). Cosmologists suggest that it is very unlikely that anti-matter in any quantity exists in our galaxy, so this limitation is not, in practice, a very severe one.

EUROPEAN ORGANISATION FOR NUCLEAR RESEARCH (CERN).

A distinguishing feature of this century is the momentum acquired by scientific research expressing itself in rapid advances in knowledge and commerce. The vast changes wrought by these means have in turn affected every phase of our social, political, and economic life, and only those with personal recollections of living in the latter part of the last century can be fully aware of the character and magnitude of the transformation that has occurred.

The gathering of new knowledge, on the one hand, and its application to industry and manufacture, on the other, are two characteristically different activities, for the promotion of which separate and distinctive provisions have to be made. CERN (derived from the initials of the original Interim Organisation—*Conseil Européen pour la Recherche Nucléaire*) is concerned only with fundamental research and the importance of gathering knowledge for its own sake was never more dramatically illustrated than in the field of nuclear physics in which CERN works. There would be no nuclear reactors and no electrical power from atomic energy (to say nothing of other less-attractive developments) if fundamental research had not first revealed the essential structure of the atom and coaxed some of the secrets out of the nucleus.

The changes wrought by science are paralleled by a corresponding change in the means required nowadays by science itself in penetrating certain

frontiers of knowledge, particularly in nuclear physics. The momentous discovery of the electron by Sir J. J. Thomson was virtually a one-man effort with what we would regard today as slender material resources. Fortunately there is still room for the brilliant individual with nothing more than his brains to bless himself, but advances across the frontier in nuclear physics based on controlled systematic experimentation can be made in strength only by teams commanding very powerful equipment. And the tools of the trade have become much more complex and expensive, beyond the single capacities of a great many nations. These inescapable facts of scientific manpower and material resources brought CERN into being to enable twelve European countries to achieve together what they were unable to do alone. The CERN research establishment and administrative headquarters are now being erected at Meyrin, near Geneva, on the site generously presented by the Swiss Government and, when completed in 1960, will cost about £20 million, borne by the member States in proportion to their national incomes.

The basic research tool in nuclear physics is the particle accelerator, in which an electrically charged particle is sped round and round in a circular or spiral path, gathering momentum with each revolution and acquiring ultimately a very high energy. The process may be likened to whirling a ball on a piece of string or elastic according to whether the particle is constrained to move in a circle or spiral. In fact, the constraint is provided by a magnetic field and acceleration by an electric field. The spiral-type machine is known as a Cyclotron or Synchrocyclotron, because of the need to synchronise the frequency of the accelerating voltage with the particle speed in the course of its revolutions. The other type of machine, which accelerates particles in a circular tube, is called the Synchrotron, which, with its magnets disposed about the tube in a circle, is much more economical of steel than the Synchrocyclotron, and for the same magnet weight produces the higher energy level. On the other hand, the design and constructional difficulties are greater.

CERN is building one accelerating machine of each type. Their energy levels are expressed in electron volts, one electron volt (eV for short) being the energy acquired by an electron in moving across an electric field in which the potential difference is one volt. The energy level of the CERN Synchrocyclotron is 6 hundred million electron volts (600 MeV), whilst that of the CERN Synchrotron is 25 thousand million electron volts (25 GeV)—more than forty times the energy level for about 25 per cent increase in magnet weight. The former was completed in 1957, whilst the latter should be ready in 1960. (A thousand million electron volts is abbreviated to GeV in Europe and to BeV in America.)

A large part of this striking economy in magnet weight is due to a remarkable advance in technique whereby the magnetic field can be suitably shaped to sharply focus and control the paths of the particles in the circular tube of the Synchrotron. This idea originated in the U.S.A. at Brookhaven, where a Synchrotron similar to that of CERN is being constructed. When ready to work in 1960, they will be the most powerful accelerating machines in the world. Russian scientists, however, have recently announced their intention of building a 50-GeV Synchrotron, twice the energy of the CERN and Brookhaven machines.

It is not difficult to appreciate the small margins of tolerance allowable in the design and construction of the Synchrotron, in which the accelerating particle is required to make half a million revolutions free from contact with the walls of a tube of 8×15 cm. cross-section. The circle of the tube is of 200 metres diameter, and the particle, before being discharged at a speed near that of light, will have travelled a distance comparable to that between the earth and the moon. Much experimentation has been needed to finalise the magnet design and constructional details, and the greatest care taken to ensure the reliability and positioning of the ring tube and magnets by supporting them on concrete pillars sunk into the solid rock below.

The high-energy particles on being discharged from the machines are used to bombard and disintegrate the nuclei of atoms placed in their path. The object is to gain information on the particles existing in the nucleus, their physical properties—rest mass, charge, spin, parity, lifetime, modes of decay, interaction with the particles—and how they are held together in the nucleus. The paths of the products of disintegration are made visible by allowing them to travel through a chamber consisting of super-cooled water vapour which condenses as water droplets on the charged particles. This well-established technique is based on the original "Wilson cloud chamber" invented over thirty years ago, and is being used by CERN staff on the Jungfraujoch to study nuclear interactions produced by cosmic rays. Recently a similar technique ("Bubble chamber") has been developed in the U.S.A. using liquid hydrogen. Much of CERN's work at present consists in adapting these and other research techniques to the stringent experimental requirements of today to enable the machines to be put to use, after construction, with a minimum of delay.

THE TRANSISTOR.

The transistor was invented by Bardeen, Brattain, and Shockley of the Bell Laboratories in America, for which they were awarded the Nobel prize in 1956.

In one decade the transistor has grown from a scientific curiosity to an accepted electronic component, around which a new technology and a new industry have been built. Enormous funds have been poured into research and development, and large numbers of scientists have devoted years of work to the solving of the problems created by its invention.

Structurally it is a relatively simple device; it consists of few parts, and its operation is remarkably well understood.

Basic Ideas.

The heart of the transistor is a small piece of semi-conductor, usually germanium or (more rarely) silicon. Germanium and silicon are elements noted for their characteristic electrical properties. Chief among these is the ability to behave either as a conductor or as an insulator, depending on the conditions.

Thus a piece of pure germanium at the absolute zero of temperature (−273° C.) would be an insulator. This is because a supply of free electrons is needed before a substance can conduct a current of electricity. At absolute zero all the electrons in pure germanium are fully engaged in orbits around the germanium atoms and cannot be spared. If we raise the temperature some of these orbiting electrons get shaken off and do become available. In this way pure germanium at room temperature (20° C.) is no longer an insulator but conducts to an appreciable extent.

Solids that change their electrical conductivity with temperature in this way are called semi-conductors.

It is however rather inconvenient to rely upon this temperature mechanism to make germanium conduct. A better way is to substitute a few impurity atoms for germanium ones. For example, the addition of a little arsenic to the germanium results in the provision of extra free electrons—one per added arsenic atom. Antimony and phosphorous have the same effect. Since electrons by convention bear a *negative* electric charge, germanium "doped" with arsenic (or antimony or phosphorous) is said to be *n*-type.

The action of an *n*-type impurity atom is due to its having one more outer (valence) electron than the germanium atom.

There also exist elements whose atoms contain one fewer (valence) electron than germanium. Examples of these are indium, gallium, aluminium, and boron. Substitution of a few indium atoms for germanium atoms results in a deficit of electrons—one per added indium atom. This deficit of *negative* particles (electrons) behaves like an excess of *positive* ones. Germanium doped with indium therefore conducts by positive charge carriers and is said to be *p*-type. A missing electron leaves behind an empty space or "hole" into which another electron can move. In a sense therefore a hole can be regarded as a positively

charged particle moving through the germanium. At any moment, of course, a free electron may meet such a hole and both will disappear, the energy appearing as heat or light. The proper operation of a transistor relies on our preventing this from happening too frequently.

The *p-n* Junction.

Two kinds of conducting germanium can therefore be prepared: *n*-type, containing arsenic, antimony, or phosphorous and in which (negative) electrons carry the current; and *p*-type, containing indium, gallium, or boron and in which (positive) holes are the carriers.

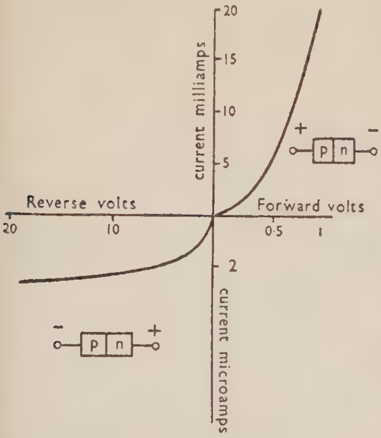

FIG. 7.—THE *p–n* JUNCTION DIODE CURRENT-VOLTAGE CURVE SHOWS THE RECTIFICATION EFFECT. NOTE DIFFERENT SCALES.

Interesting effects occur if an *n*-type region is formed next to a *p*-type region in the same piece of germanium. Across this boundary or *p–n* junction, as it is called, rectification occurs. That is a current flows easily in one direction but only with difficulty in the other (see Fig. 7). Very large numbers of *p-n* junction diodes are used for D.C. power supplies for radio detection and as switching elements in computers.

The Junction Transistor.

Even more interesting effects occur if two junctions can be contrived close together in the same piece of germanium. If we arrange for a *p–n–p* system, for example, as shown in Fig. 8, we can observe transistor action. Let us pretend that

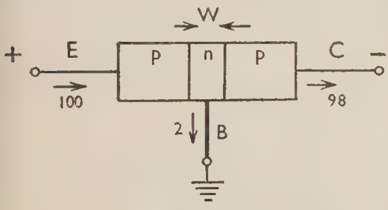

FIG. 8.—*p–n–p* JUNCTION TRANSISTOR.

the left-hand junction does not exist and consider first the right-hand one. If C is negative with respect to B only a very small current flows between them, since the BC junction is " biased " in the reverse direction (see Fig. 7).

We therefore have a small current flowing in a high-resistance circuit.

Let us now consider the left-hand junction. Here we have made E positive with respect to B, and so this junction is biased in the easy-flow or forward direction and an appreciable current flows.

We must make two further assumptions: (*a*) that our EB junction is so made that most of the current across it is carried by holes, only a little by electrons; (*b*) that the width of the middle *n*-layer is very small. Both these things are easy to arrange.

If we now think of both junctions operating at the same time we have the following picture. The left-hand junction " emits " a sizeable current, mostly holes, which then diffuse across the middle *n*-layer (the base) and are " collected " by the right-hand junction. However thin we make the base region, some holes will be lost (because electrons fall into them), but in practice this loss can be made small—say not more than 2%.

Thus if 100 units of current flow into the emitter, perhaps 98 units will reach the collector, and the other 2 must flow out through the base.

This arrangement of junctions, biased in this way, is called a junction transistor.

It can be operated in a number of ways. If we feed an alternating signal, say a radio-wave signal, into the EB path, then a replica of this signal will appear across CB. Since EB is a forward-conducting junction, it has a low resistance, whilst BC is a high-resistance circuit. Although the *currents* in EB and BC are almost equal, this large difference in resistance means that the signal *voltage* in BC has been *amplified* in passing through the transistor. Since the B terminal is common to input and output, this mode of operation is termed common-base.

It is also possible to operate the device in common-emitter connection. In this mode we insert the signal into the base and take the output from the collector. Suppose we make the base current change by 2 units. Then we see from Fig. 8 that the collector current changes by 98 units, giving a current amplification of 49 (= 98 ÷ 2).

Advantages of the Transistor.

Of course a thermionic valve can also amplify and has been used for many years for this purpose (*see* X8). One might therefore ask why such great interest has been shown in the fact that the transistor can do what valves already do. The answer is that the transistor has certain advantages, *viz.*, low power, low voltage, small size, long life, robustness, and low cost. The thermionic valve needs a great deal of electrical power merely to heat the cathode and provide electrons, even when there is no signal being amplified. The transistor uses a quite different principle and needs no heat to function. Also high voltages are normal in valves, say more than 100 volts; transistors, on the other hand, work well in the region below 10 volts. The small size of the transistor can be illustrated by saying that the germanium piece used may be about $\frac{1}{10}$ inch square (the size of the F at the top of this page) and about 3 mils (a mil is $\frac{1}{1000}$ inch) thick (*i.e.*, the thickness of this paper). The long life of the transistor is still to be completely achieved but good progress has been made already—the absence of a hot cathode slowly ageing is the secret of success here. Transistors are robust because they are made of solid materials—there is no vacuum to preserve and no finely spaced electrodes which can vibrate. Finally, because it is simpler, the transistor should be cheaper to produce. So far this promise has not been realised, largely because the rapid sequential development of new types has made stabilised mass production a risky venture, but the ultimate cost should be well below that of valves.

There are, however, compensating snags to the transistor. One is the relatively low power which can be handled. This problem arises because to handle power a device must get rather hot, and as we have seen a rise in temperature affects the electrical conduction properties of semi-conductors. The solution is expected to come from two approaches: (1) to devise better ways of getting rid of the heat, and (2) to use semi-conductors

which can stand a higher temperature without becoming too conducting. Among the latter, silicon is very promising. Whereas a germanium transistor will cease to operate efficiently above about 100° C., silicon can go up to 200° C. Newer, compound, semi-conductors can go even higher, *e.g.*, gallium arsenide up to 350° C., but this work is at present of an experimental nature only.

The other main deficiency of transistors is the relatively poor frequency response. If we were to increase the frequency of the signal being amplified by the transistor in Fig. 8, for example, we should find that above a certain value (called the cut-off frequency) the amplification fell off rather sharply. The reason for this is that the holes which carry the current from the emitter to the collector have to cross the base region (width W) by diffusion, and this takes time. Furthermore, they do not all take exactly the *same* time. If the emitter current changes rapidly it may happen that the collector current will be quite out of step with it and the device no longer operates well. It turns out that in order to amplify a 1-megacycle signal (a typical medium-wave radio frequency) one needs a transistor which has its frequency cut-off at about 10 megacycles. This implies a very small value for W—in fact $\frac{1}{2}$ mil, or $\frac{1}{6}$ thickness of this paper. It is fairly difficult to achieve base thicknesses much lower than this, unless special techniques are used.

How Transistors Are Made.

Most transistors available commercially at present are of the germanium-alloy type. Two small dots of indium are placed in contact with a small, thin wafer of n-type germanium and the whole assembly heated to about 600° C. in an oven for a few minutes. During this heat-treatment the indium dot forms an alloy with the germanium underneath it, and on cooling down a heavily doped p-region is found to have been formed (see Fig. 9a). Contact wires are then attached to the two indium dots and to the n-type wafer—giving

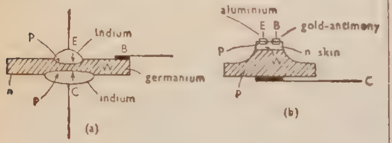

FIG. 9.—(a) ALLOY, (b) DIFFUSED GERMANIUM p–n–p TRANSISTORS. THE CROSS-HATCHED PORTIONS SHOW THE STARTING MATERIAL.

the emitter, collector, and base electrode connections. This type of transistor is easy to make and is quite suitable for medium frequencies, up to a cut-off of 20 megacycles or so, which corresponds to a base width (W) of about $\frac{1}{3}$ mil.

The demand for transistors operating at higher frequencies is satisfied by using the "solid-state diffusion" method of transistor fabrication. To illustrate this technique we shall describe the construction of the germanium diffused transistor which was used in the radio transmitters carried by the American satellite *Explorer I*. The starting-point is a slab of p-type germanium, 3 mils thick, which is placed in a furnace containing antimony at about 800° C. At this high temperature atoms of arsenic slowly diffuse into the solid germanium to give an n-type "skin" of thickness $\frac{1}{20}$ mil. This skin is destined to be the base region of the final transistor. The next step is to evaporate two fine lines on to the surface of this skin—one of aluminium, the other of a gold–antimony alloy. These lines or "stripes" as they are called may be 6 mils long, 1 mil wide, with a separation of $\frac{1}{2}$ mil. The complete device is shown in section in Fig. 9b. The gold–antimony stripe serves as an electrical contact to the base, and the aluminium stripe, when alloyed in, becomes the emitter. Because of the very narrow base W, about $\frac{1}{20}$ mil in this case, the frequency cut-off of these diffused transistors is commonly of the order of 500 megacycles, and oscillator circuits using them operated at 200 megacycles in the satellite *Explorer I*.

Applications of Transistors.

The first large-scale application of transistors was to battery-operated hearing aids. This is a field where the low power requirement and small size of transistors has been fully exploited, and the valve hearing aid is now virtually obsolete.

The transistor radio set, too, is now quite common. Its ability to run off a small, cheap low-voltage battery makes it the ideal portable or personal receiver. This economy of operation is at present offset by the rather higher price of the transistor set compared with its valve counterpart, but it is confidently expected that this difference will disappear as the production of transistors at low cost gets under way. When this happens there does not seem to be any reason why all portable radios should not use transistors, rather than valves.

A large number of cars are now fitted with radio sets. Hitherto these have, of course, been valve radios, and a serious problem has been the stepping-up of the 12 volts supplied by the battery to the 200 volts or so required by the valves. This stepping-up has been carried out by a mechanical converter which is noisy, expensive, and rather unreliable. Transistors, on the other hand, are quite happy to work off a 12-volt battery, no converter is needed, and so a cheaper set can be made. There is the added attraction that a transistor set comes on immediately the switch is turned—there is no warming-up period as in a valve set. Both this and the hearing aid use the alloy germanium type of transistor.

It is also possible to build a transistor television set. A recent experimental exercise with this aim resulted in an extremely compact instrument about 8 inches high, 9½ inches wide, and 14 inches long, which weighed only 19 lb., including the 12-volt battery. It contained twenty-four transistors, twelve diodes, one rectifier valve, and, of course, the television tube. In order to keep the battery drain down, a small (9-inch) tube was used, and this accounted for 1·8 watts out of a total set consumption of 8·5. A truly portable receiver of this kind, with such economical power requirements, could have many applications—it could easily be operated in a motor car, for example. It is believed that many American manufacturers are at present actively developing transistor television sets. Because of the high frequencies used in television, the transistors employed here are of the diffused type.

Future Prospects.

In order to make transistor production a feasible commercial proposition, numerous problems had to be solved. One of the most difficult was the preparation of germanium sufficiently pure for the electrical properties to be under control. Typical impurity levels in such material are around 1 part in 10 million, and to reach this value consistently one starts with germanium fifty times purer than this. The methods used to achieve these incredibly pure materials are finding general application in other fields remote from transistors. Great progress has also been made in the handling of very small dimensions, which may prove of general usefulness in time.

The remaining problems are reliability, on the one hand, and low cost, on the other. With the improvements expected in the possible life of transistors their use in all forms of telecommunications will increase. Various selected applications have been evaluated and put into service in telephone systems, and we look forward to the day when transistors are incorporated in submarine cables. A great future lies before the transistor in all types of electronic-computer use, where low power, small size, and reliability are important. Finally, the manufacture of transistors on a large scale at low cost is the main aim of the many companies now engaged, and this will lead to the extensive use of transistors in telecommunication industry generally and in the home—not replacing valves entirely, but rather supplementing and complementing them.

THE FUTURE OF AIR TRANSPORT.

Speed for Sale.

In speculating upon the future course of air transport it is well to begin by glancing at its past and its present. The spectacular rise in aeronautics in this century has largely been produced by the impetus of two wars, which have carried air transport on their back. Designers and operators of air-liners have relied to an inestimable extent on experience accumulated in the military field; the air-liners of the past decade were clearly fathered by the bombers of the last war; and the uncertain future of the British civil aircraft industry springs in part from the realisation that a feather bed has perhaps disappeared. From this connection flows the pure milk of the speed doctrine. No one would deny that in air warfare speed is paramount. From this it is an easy step to the proposition that since air transport's first asset is speed, its most profitable line of advance is to sell ever-increasing speed to those who will buy it. This is not as self-evident as the basic fact that the air, in contrast to all other transport media, has no speed-ceiling if costs are disregarded. Thus its unique asset is its flexibility in operating speeds, which at present range between 150 and 600 m.p.h. This admirable feature could open the way to satisfy the needs of widely different sections of the travelling public. This seems unlikely to happen under a policy which appears to be set upon devoting its major effort to extending the upper limit of the speed band and discarding its lower limit, and so continually increasing the gap between air speeds and surface speeds. Such a course makes sense only if the journey is so long that increased speed brings the traveller a significant saving in time. A glance at the routes of the world's most highly developed air-lines is illuminating in this context. The U.S. air-lines have a circle of roughly 2,500 miles diameter in which to operate; B.O.A.C. stretches west to San Francisco and east to Sydney; B.E.A. reaches out to the Levant. Thus air transport has already ensured its most obvious gains by establishing a very-long-range facility; and given this pattern there may be profit in its policy of reducing times until a London business-man can get to Australia and back comfortably in three days. The reasons for this concentrated attack on speed are to be found in the social, economic, and political trends of our time. A national air-line is a chosen instrument, it almost carries the flag; the Atlantic crossing is the recognised arena for contests of prestige; the speed of sound (about 650 m.p.h.) is becoming the unit of air speed; Mach numbers are passing into common parlance.
